THE LANCET.

LONDON: SATURDAY, AUGUST 29, 1908.

259

Address to Students.

In October several hundreds of students will enter at different centres upon the long course of study which is to lead to their becoming qualified for the practice of medicine. The exact number cannot yet be guessed at, but it seems probable that it will not be so high an aggregate as in some previous years, and certainly will not promise an excess of medical men for the national service. It is, perhaps, too much to imagine that each one of these has been led to study medicine by a special liking for the life and work of a medical practitioner, but it is at least to be hoped that a large majority have been specially attracted towards medicine as a pursuit. The old-fashioned phrase that spoke of a man's "having a call" to some special work, a phrase that lingers now only in the "call" of some religious bodies, expressed the right idea that each man receives a summons, or call, to the work for which he is best suited. The idea survives, indeed, in the phrase "a man's calling," and "vocation" expresses the same thought through the Latin, but these words as now applied mean nothing more than the business or work which a man follows; indeed, the idea itself is so lost that most people confuse vocation and avocation, and imagine that the two are mere variants of one word, though they are really intended to be contrasted. That man will be likely to do best in any work who has a natural aptitude for it, and who feels that while doing it he is certainly fulfilling his destiny. On the other hand, a man who has no inclination towards the work which he undertakes will be less likely to do it well; he may put into his work as much energy as the other, but the zeal for the work will be wanting and the result will show the difference. "The labour we delight in physics pain," and the man who is doing work that he likes will always be able to do more work and better work than he who is compelled to follow a pursuit uncongenial to him.

In every school of medicine there must be some who are unsuited for the work which they have undertaken, or who have no inclination for it. In some it is not a mere absence of inclination, there is an actual distaste for the study of medicine. In cases such as these there is little hope of true success. Seldom do they do good work and for the most part they serve but to increase the number of those who fail repeatedly at examination after examination until they are the despair of their teachers and of their school. The choice of a profession is frequently made by a boy's father; if he is a medical man with a good practice it is only natural that he should wish to see his son follow in his footsteps and if the son himself is willing and able nothing could be better; it is not unreasonable to assume that there is often an inherited aptitude for medical practice, and this may well be so whether acquired characteristics are transmissible or not. Sometimes a father parcels out his boys amongst the various professions in the manner which seems to him best, little regard being paid to any natural inclination on the part of the son. All will remember the account which Eugene Wrayburn in "Our Mutual Friend" gives of his father, how he prearranged from the hour of the birth of each, and sometimes from an earlier period, what the little victim's calling and course in life should be, how one was to be a barrister, and a barrister he became; another was to become a pillar of the Church, and a pillar of the Church he was, albeit a very shaky one; a third was destined for the navy, and was commissioned as a naval officer, while equally early a fourth was destined to develop mechanical tastes. Dickens's sketch was, of course, intended to be a caricature, but, like all good caricatures, it only over-emphasises features that exist. There are many fathers who insist on devoting to particular pursuits, and to the medical profession among others, boys who are unsuited by natural aptitude to do well in the sphere of life chosen for them. It is certainly a difficult matter to decide how much weight should be given to the wishes and feelings of a boy of 16 or 17 years of age in settling his career, but there can be no doubt that it is unwise, and may be worse than unwise, to ignore entirely the inclinations of the boy himself. It may well be said that a boy at such an age is not old enough to know what is really best for him. This is true to a certain extent, and we know that at an earlier age the choice of the future profession varies with the boy's views from day to day, but at 16 years of age or so a lad may reasonably know what occupation is distasteful to him and what is attractive, and these likes and dislikes should certainly be given some weight, and that not small, in the decision, though the final judgment must rest in the father's hands. When a boy who is unsuited for it becomes a medical student it is not unlikely that he will relinquish the work before his studies are completed should opportunity offer. In the well-known statistics compiled by Sir James Paget, which were based on 1000 students who had been attached to St. Bartholomew's Hospital, it is shown that some 10 per cent. of the students gave up their medical studies before obtaining a qualification and betook themselves to some other pursuit. We cannot doubt that many of these were from the first unfitted for the study of medicine. Fortunately, it is not always absolutely necessary to decide for good and all at the very beginning of the student's work, for a preliminary examination in general knowledge has to be passed, and the same examination will in several cases avail for different branches of subsequent study. As a rule, it may be laid down that it is well for the student to pass the best examination in general knowledge that he can, and one of the most convenient for the purpose is the matriculation examination of the University of London, which despite the hard criticism that it comes in for, even in its modified form, is a useful test of preliminary training. It is obvious that a good preliminary training in general knowledge is of the greatest value for a medical student; and this is so for

No. 4435.

many reasons. The medical profession now occupies a higher position in the country than was formerly the case, and the more weight that is given in the counsels of the nation to the opinions of the medical profession the better it will be for the country. In order, however, to maintain and to be worthy of such a position it is necessary that the members of the profession should in general knowledge and culture be fully the equals of those with whom they have to work.

It may well happen that a boy is hesitating as to whether he should enter as a medical student or not, and his father may be in an equally uncertain frame of mind. For those in doubt what advantages possessed by the practice of medicine can be advanced to determine their choice? In the first place, it can be laid down as beyond possibility of dispute that the practice of medicine is beneficent; the good that it does cannot be measured by money. It preserves to a family the breadwinner, without whom there would be utter ruin; it saves for the mother and father the little child who has been threatened with death, and the lives of the old are prolonged by it in comfort. In less serious cases pain is relieved or banished, disabilities are removed, and health and strength are restored. If we may measure the value of a profession by the amount of good that it does there is none which can compare with the practice of medicine. That is so even if we consider only the therapeutic side of the science, but still more obvious is it when we think of the preventive work for which the profession is responsible. Vaccination itself saves the country from an enormous amount of sickness and many deaths; by the discoveries of the mode of infection in typhoid fever it has become possible to diminish greatly the number of cases of this disease. By prophylaxis in surgery it has been possible to reduce the death-rate of all operative procedures, and in numberless other ways medicine in its various branches has best treated disease by preventing it. So much, and very briefly, for good done, and ill prevented; we have next to consider what recompense does the practice of medicine offer for the work effected? Here the answer can hardly be as enthusiastic as we could wish. A few, a very few when we consider the large number of medical men in this country, earn large incomes, but even these incomes can hardly be considered large when we compare them with the pecuniary results obtainable in some other callings. A goodly number of medical men earn a moderate income and only too many are hardly able to make ends meet. It has, indeed, been said that the average income throughout the profession is less than £250 a year, but it is difficult to imagine on what data the estimate has been based, and in our opinion the statement, which has been widely circulated, is incorrect. In addition to the medical services of the Navy and the Army there are now very many municipal and county council appointments which are open to medical men, and recent legislation has led to the creation of many posts in connexion with elementary education. In most of these Government or official posts the pay is not very high, but it is certain, and the certainty of payment goes far to make up for the smallness of the amount. There is another advantage of medicine worthy of mention, and that is that the mere increase of years is no bar to the successful perfo ance of work. In many callings a man may easily be old at 40, and every year that he lives he may find chance of earning a livelihood diminishes. In medici however, it is not so; unless a medical man is rende incapable by illness or infirmity his age is no drawback his work; in fact, so far as the public is concerned, increase of age is considered to be necessarily accompan by an increase in professional knowledge and ability; a with certain limitations the public view is a just one, and o that juniors in the medical profession would be well advis to give more heed to.

We have mentioned some of the advantages which a connected with the practice of medicine, but it would l unfair to refrain from referring to the disadvantages whi it often entails. Before a man is allowed to practise his pr fession he has to spend at least five years of his work i study; this, the statutory period, does not nearly suffice f the average student and does not include the time spent i work for the preliminary examination in general knowledg This is a long training, and when the student is qualific he will find that much hard work remains. Whateve branch of the profession he adopts there will be mucl to be done without any payment other than of a approving conscience. He will find that at any hour o the day or night he is liable to be disturbed by an appea for medical assistance of one kind or another. He wil find that his generosity is often abused, that many wh are well able to pay his fees will endeavour on one plea o another to escape paying their just debts. Yet with all its disadvantages, all its troubles, there is no profession which is more loved by its followers than is the profession of medicine, and few indeed would be willing to exchange it for another.

When it has been finally decided that a young man shall become a medical student it is necessary that a medical school should be chosen, and there is no lack of choice. To decide between London and provincial schools is by no means easy, for there is much to be said on both sides. At the present day there are many provincial medical schools as well equipped as any schools in London and the amount of clinical material is probably as great, but London is unapproachable in the extent of its educational and clinical facilities; no provincial museum—in fact, no medical museum anywhere—can be compared with the museum of the Royal College of Surgeons of England, and we feel that it is a definite gain to any student of medicine to spend at least a portion of his time in London. In London there is, again, sufficient variety of schools from which a choice can be made and many considerations will exert an influence. Sometimes a school is chosen because of the presence of a well-known name on the staff, but this must not be given too great weight; sometimes even the name of a consulting surgeon or physician of a hospital may influence the choice, owing to a want of knowledge of the fact that the members of the consulting staff have no active connexion either with the patients or the students of a hospital. Some students will go to one hospital becar e the medical school is large; others will prefer a small medical school. There is reason for each choice. In a small school the probability of a student ultimately attaining to a position on the staff is vastly greater than at a large school, where the competition is often very keen. When a student is the son of a medical man usually he goes to his father's old hospital. One medical school may excel in one department and another in another. At one time it was possible for a student to take one class at one hospital and another at a second hospital, and perhaps even a third class at still another hospital. There is something to be said for such an arrangement, but now a student usually takes all his classes and practical work, at all events in the final subjects, at one medical school.

At the present time it cannot be said that the educational and examining bodies of London so far as they have to do with medical matters are in a satisfactory condition. There is room for amendment in many ways. In the first place, there is a great waste of energy in the teaching of the earlier subjects of the curriculum. Certain of the medical schools have expressed their willingness to resign the teaching of some of the earlier subjects, such as biology and physics, and several are also willing to give up the teaching of anatomy, physiology, and chemistry, while others prefer, for the present at any rate, to persevere in the complete educational curriculum. We do not propose to enter into the details of this difficult and vexed question at this moment, but no one can deny that at the present time in London there is unnecessary duplication and triplication of the teaching of these subjects, in fact, if the English language could supply a suitable word it might be used to express the fact that many lectures and demonstrations are repeated unnecessarily 10 or 12 times. What are the results? The classes at many of the schools are pitiably small, so that the remuneration of the teachers is absent or not at all commensurate with the work which they do. It also follows that the amounts that can be expended on accessories for lectures and demonstrations are smaller than they should be. There is a sound argument in favour of the present arrangement and that is that the teaching is done for the most part by medical men who are engaged in the practice of their profession and therefore is more likely to have a direct bearing on the student's subsequent work. But more than this ought to be advanced to justify a waste of energy that is proving a drawback to medical education in the capital of the empire, and many who have given years of their life to the problems of medical education believe that amalgamation of the teaching of the earlier subjects is necessary and that it will in time come about. It is not suggested that all the students should be brought to a single centre, though that may be the ideal plan. Three or four centres may reasonably be arranged in London, so that propinquity to the several hospitals may be considered. We feel sure that such an arrangement would prove a very certain gain to the students of London and would pave the way to further reforms. The Senate of the University of London has returned to the donors the sums subscribed in support of a movement in this direction, an action which has been much criticised, but although the matter has been postponed for a while, we do not doubt that in the near future some scheme or schemes of concentration will be found necessary, if London is to be, as it should be, the leading medical centre of the country.

There is one very great disability under which the London medical student labours, and that is the difficulty that he often finds in obtaining the degree of M.D. When the University of London was reconstituted a few years ago it was hoped that it would have made the degree of M.D. more accessible, but the result of the reconstitution of the University has been that the difficulties have not been removed, and in addition the increase of the fee for the M.D. examination from £5 to £20 may deter many of the poorer students from venturing to enter. To the medical world the University of London seems to be suffering from an excess of machinery; it reminds us of the ingenious contrivances of some inventors of perpetual motion, who, by the employment of an immense number of wheels and levers, endeavour to hide from themselves and others that all this assemblance of working parts can do no work. We do not doubt the earnestness and the zeal of the present senators, they are doubtless doing their best, but the result is a muddle. One of the chief faults of the regulations for the medical degrees of the University is the undue importance attached to the earlier subjects in medical study, for they are looked upon as worthy of being studied for themselves instead of as merely introductory to the subjects which are essentially medical. These earlier subjects, anatomy, physiology, and chemistry, are doubtless of much importance, and for special cases and as science subjects they deserve the fullest attention, but for the average medical student they are chiefly to be studied for the bearing which they have on the practice of medicine and surgery. It is true that the study of these subjects is a good training, but time does not permit the average student, even with the additional period now added by the University of London to its medical curriculum, to devote himself to them for so long as is needed for the examinations of the University. Another evil flows from the attempt to make the average student learn so much of these earlier subjects, and that is, that he does not remember later as much as he really needs. All who have taught students the final subjects will agree that the average student has forgotten the greater part, or even nearly the whole, of his anatomy, physiology, and chemistry, so that he cannot utilise to the full the later teaching. Let the student study these earlier subjects with a reference to the applicability of the knowledge to his life work and not merely with reference to their scientific interest.

We would interpret widely the reference of anatomy, physiology, and chemistry to medicine and surgery; we do not urge any narrow limitations of the teaching of these subjects, but all through the teaching the ultimate object must be borne in mind. We are now thinking mainly of physiology and chemistry. It is not easy for a student to devote too much time to anatomy, and there is comparatively little of the subject which may not prove of value at one time or another, though the teacher must bear in mind the wonderful faculty for forgetting possessed by most students as soon as the examination is passed. In physiology, and especially in chemistry, much of what is taught in all the medical schools of the country is of no direct use to the student in view of his future pursuits, and though it may be reasonable enough to include it in the syllabus of a science degree it is out of place in the curriculum of the average medical student. It is only necessary to glance at any examination paper on organic chemistry for the London M.B. degree to appreciate the correctness of this statement. The questions have for the most part nothing to do with the practice of medicine, and the syllabus as set forth in the regulations shows that those who drew it up did not realise the needs of medical students. The object of medical education is to train men to practise with success the various branches of medicine. To that end all training must be subservient, and any teaching which obstructs or retards the progress of the student is clearly harmful. The average student is undoubtedly hindered by the overloaded character of the curriculum. For students aiming at honours it may be well to insist on a high academic standard in subjects not strictly professional, but for the average student it is a decided mistake, and it is he whose needs have to be considered in arranging a scheme of education and examination. At present the purely educational bodies are helpless; they must supply what is called for by the examining bodies, and on these latter the onus of the present condition of affairs rests. The old schools of Oxford and Cambridge, Edinburgh, and Dublin, and the modern schools of our great commercial centres are all concerned, though the position may seem to press now more upon one than upon another.

In London we have a special position. We have an excellent examining board in medical subjects—namely, the Conjoint Board of the Royal College of Physicians of London and the Royal College of Surgeons of England Their examinations are admirably conducted, their requirements are reasonable, and the standard is high, as high as is required for many degrees of M.D. in the British Isles or elsewhere, but the corporations cannot grant a degree of M.D. to their successful condidates. The average London student is therefore at a disadvantage with his provincial fellows, for the public, which knows very little about medical degrees and distinctions, looks upon the M.D., any M.D., as evidence of medical knowledge, while it hardly distinguishes between F.R.C.S. and F.R.G.S. or between L.R.C.P. and R.S.V.P. It is undoubtedly a handicap for a medical practitioner to be without the degree of M.D. and the consciousness of having passed examinations as searching as those passed by many holding that degree will not make up for the lack of it. This is an urgent matter for the London student, and he naturally looks to his University to come to his assistance. The final subjects are those which are most important to the average student, who will spend his life in the practice of some branch of medicine. On his knowledge of them his success in treatment will depend, and here the man who holds the English Conjoint diploma is the equal of any qualified medical man on the professional roll. There was a time when lectures formed the greater part of the course of instruction of the student, and there was a reason for this since text-books were few and incomplete. At the present time, however, books abound on every conceivable branch of medicine and lectures have lost much of their pristine value. Their importance has been tranferred to demonstrations and practical work, and these object-less are immensely more instructive to the student. There no centre in the world so good as London for clinical instruction, and the University of London should be eage to enrol among its graduates a large number of the medical men trained in such a manner.

With the progress of medicine the extent of the subjects included within that name has enormously widened and the creation of special departments of medical knowledge has added greatly to the amount of learning demanded from the student at his final examinations. The teacher of each special department naturally asks, and the public also asks, Why is a student generally not examined in diseases of the eye, of the ear, or of the skin? Of course, an occasional question in each of these subjects is set at the written examination, occasionally even a clinical case involving some knowledge of a special branch is shown, but there is no definite examination in these special subjects. Hygiene has taken an important place in modern medicine and it requires, and often receives, recognition in the final examinations, but hygiene is as much a special branch in actual practice as ophthalmology, and should be treated in the same way by examiners. A knowledge of anæsthetics should also be made compulsory on all candidates. A student must obtain a certificate of having learned to vaccinate, perhaps one of the simplest operations that a medical man ever has to perform, while he is not required to produce any evidence of having been instructed in the administration of anæsthetics, a vastly more difficult matter. And this increase in the area of therapeutics is by no means all that our educational authorities have to deal with. Within recent years great strides have been made in the art of diagnosis. Blood examinations are very different from what they were 20 or 30 years ago. Then it sufficed if the number of red and white corpuscles was given, with perhaps the percentage of hæmoglobin; now a differential count of the varieties of leucocytes is often considered necessary. The various blood reactions form another important branch of investigation for diagnostic purposes and the opsonic reaction has introduced a still more complex diagnostic aid which is also of great therapeutic importance. The Roentgen rays also, of equal use for diagnosis and treatment, have added another complication to the already huge mass of medical knowledge to be absorbed by the student. We mention opsonins and the x rays as of therapeutic as well as of diagnostic importance, and there are in the realm of therapeutics many recent additions to our medica armamentarium with which the student is expected to b acquainted. The preparation of sera and of vaccines has already reached an important stage, and it appears that th future of these and similar methods of treatment will b very important. What can be done in this serious stat of affairs? How is the medical student to be taught hi work within a reasonable limit of time, or to put the question round the other way, how is it to be decided what is th reasonable limit of his necessary education?

At the present time there is a tendency to th growing up of a distinction between two classes o medical men. We are not referring to the line that have been drawn between surgeons and physicians or even to the distinction between general practitioners and consultants, but to the clinicians and the laboratory workers. There is not time, there is not a possibility of one man being able to become an experienced clinician whether in medicine or surgery and at the same time experienced in the laboratory processes which now form so important a part of modern diagnosis and treatment. Examiners are apparently insisting on a smattering of all these subjects, and something must be done to lighten the burden. We have endeavoured to show that in the earlier subjects the average student may be readily and beneficially relieved from a great deal of top-hamper which only seems to diminish his stability; but more relief still is needed. It has been suggested that a large part of the laboratory work should be placed into the hands of laymen, nd undoubtedly some admirable scientific investigations pon medical subjects are now being conducted by men who ave received no distinct medical training. We should be orry to see any great development of this principle, for it ill tend to divorce the laboratory work completely from he clinical work. Even at the present time there is a endency for the pathologist to override the clinician. It might be possible for the final examinations to be differentiated so that a student might qualify in pathology and not necessarily in the other branches of medicine, but although this idea has received some support it hardly commends itself to us in this form. Another suggestion is that the medical student should begin his special training quite young, as our naval officers do, the study of the preliminary scientific subjects at an early age being more convenient than the postponement of qualification for several years. Some countries do require a long course of medical training; we believe that in Sweden the curriculum lasts ten years or so; but this again is not a solution that commends itself to us. The segregation of medical men into a class from boyhood would tend to restrict their sympathies and capacities, and the medical practitioner, above all individuals in the social scheme, ought to be a person of wide sympathies.

We are inclined to think that a qualifying examination for all should be passed, that the standard and course of study required should be very much like those of the Conjoint Examining Board of England, and that those passing this final examination should attain the degree of M.D. For those wishing to engage in research work or in hygiene or in any special work a further course of study in that special subject should be required to be followed in due course by a special examination It is right that students and their parents should know that the present position of medical education in this country, and especially in London, is unsatisfactory, and that there must be amendments.

WORTHING HOSPITAL.—The Rev. C. H. W. Capron, who died at Worthing on August 20th, has left a bequest of £1000 to the Worthing Hospital. The deceased gentleman was formerly rector of Stoke Doyle, Northamptonshire, and vicar of Warmington in the same county. He had resided in Worthing since his retirement from active clerical duties 28 years ago He was 82 years of age. This generous bequest comes very appropriately with the Worthing Hospital extension scheme referred to in THE LANCET of August 8th.

THE STUDENT'S GUIDE.

SESSION 1908-1909.

A PREFATORY STATEMENT.

THE quantity of the subjects which fall necessarily within the scope of our educational number has now become very large, and it may be as well, as on previous occasions, to explain the scheme upon which the following guide to a medical career in this country is constructed.

The General Council of Medical Education and Registration, conveniently known as the General Medical Council, is the controlling authority, under the Privy Council, of the medical education of the land. Under the provisions of the Medical Acts various universities and corporations are recognised as being examining bodies whose degrees or diplomas entitle to medical registration, and it is among the duties of the General Medical Council to keep the official register and to insure by periodical visitations that the tests of the various examining bodies are maintained at a due standard. We begin by detailing the powers of the General Medical Council, and go on to give in detail the regulations of the various examining bodies.

But the student must be taught as well as examined, and the systems under which he can obtain instruction do not conform to one pattern. The curriculum of the medical student falls into two parts, the preliminary subjects and the professional subjects, and the two cannot be sharply divided. The extent to which they are allowed to overlap under different schemes of education varies a good deal, while the extent to which they ought to overlap is a perennial subject of debate. The preliminary subjects are, to mention only the four important ones, chemistry, biology, anatomy, and physiology, and they are taught in the school proper; the professional subjects, medicine, surgery, and obstetric medicine—under which headings all forms of specialism are included—must be learned in the wards of a hospital. All schemes of medical education require a school and a hospital, but there their uniformity ends.

There are nine universities in England and four in Scotland which possess a faculty of medicine. The number in England will be increased quite shortly, while in Ireland under the Irish Universities Bill the number will be raised to three. The universities are prepared to educate their students to a varying extent, or to delegate the preparation of their candidates to other recognised bodies; they then examine their students, generally and in England invariably, with the help of examiners brought in from other medical centres, and bestow degrees in medicine upon the successful candidates. We give the regulations of these universities and follow with those of the Royal Colleges of the three divisions of the United Kingdom, of the Society of Apothecaries, and of the Apothecaries' Hall of Ireland.

From this point we pass to the consideration of the hospitals at which the latter part of the medical training of the students must be received. The students at these hospitals may look to the hospital medical school for the whole of their training, as, for example, the student working for the diploma of a corporation would generally do; or they may be taking out a clinical course at the hospital, intending to graduate at one of the universities. In a sense, therefore, the medical school and wards of every hospital form part of a university, by supplying an integral section of the teaching required by the university from candidates for medical graduation; and this has been recognised in the reconstitution of the University of London under which all the medical schools of the metropolis are affiliated to the University of London.

Detailed information concerning all the medical schools and their hospitals naturally forms the bulk of the STUDENTS' NUMBER of THE LANCET; but we follow upon this with an account of the condition of medical employment in the Naval, Military, and Indian Medical Service, and in the Public Health Service, concluding with a report upon the system of education in dental surgery.

We think that the reader with this brief prefatory statement before him will know where to look for any subject upon which he wants enlightenment.

GENERAL COUNCIL OF MEDICAL EDUCATION AND REGISTRATION OF THE UNITED KINGDOM.

POWERS AND DUTIES OF THE GENERAL MEDICAL COUNCIL.

As there is apparently, even among members of the medical profession, a great amount of ignorance as to the powers and duties of the General Medical Council, we think it well to lay clearly before our readers what the General Medical Council is and also what it is not.

Many of the false ideas on the subject are due to the use of the shortened title, "General Medical Council." The full title is, "General Council of Medical Education and Registration of the United Kingdom." This title is in accordance with the Medical Act of 1858, by which the General Medical Council was established under the Privy Council to enable persons requiring medical aid to distinguish qualified from unqualified practitioners. The Council was thus instituted not primarily for the benefit of the medical profession but to insure an efficient medical service to the public. It is obvious that by so doing the profession itself gained, in that official sanction was given to reputable practitioners only, while a proper guarantee was afforded to the public that the standard of medical education should always keep abreast of the scientific knowledge of the day. The powers of the Council under which it fulfils these important functions fall under four heads. It is first a registering body: it registers the entry of students upon their medical studies and also the attainment by them of the degrees or other qualifications that legally entitle them to practise medicine. This last duty forms its chief service to the State, as a complete list of practitioners of legal standing is thus rendered available for the information of the public. Secondly, it assures the public that the education of medical men is kept up to an efficient standpoint by maintaining at the proper pitch the standard of the various medical examinations. Thirdly, it is a penal and disciplinary body, having power to remove from the Register any practitioner adjudged guilty of conduct "infamous in a professional respect." Here again it is the public interest that is first considered, although these powers are for the very material advantage of the medical profession. The last duty of the Council is the codification of pharmaceutical remedies. Reform in the administration of the finances of the Council has of recent years removed acute pecuniary strain from that body, but the day should soon come when the State, recognising the public value of the work of the Council, should be willing to subsidise its efforts. Registrars are appointed by the General Council and by the Branch Councils to keep registers of qualified persons. They are bound by Section XIV. of the Act to keep their registers correctly, a duty which, mainly owing to the apathy of members of the medical profession, can only be performed with difficulty.

It is as well here to put down the advantages, such as they are, of being duly registered. A duly registered practitioner may sue in the courts of law for the recovery of charges for medical attendance or advice, or surgical attendance or advice, or for the supply of medicine, or for the performance of any operation—provided that he is not debarred from suing by being a Fellow or a Member of any corporation which objects to its Fellows or Members so suing. He may be exempted, if he so desire, from serving on juries, from serving sundry corporate and parochial offices, and from serving in the Militia. Only a registered practitioner can hold appointments in the navy, army, and in sundry Poor-law and other institutions. Only a registered practitioner can sign a valid medical certificate. Removal of the name from the Register debars a man from all the above-mentioned privileges.

The General Medical Council is in no way a medical protection society or a medical defence union. It is not a professional union or a guild charged with looking after the interests of the medical profession after the manner of the old trades guilds, except in so far as it is concerned with the education of medical students. It has no powers over any member of the medical profession except to remove the name of any offending member from the roll of the profession or Medical Register. It cannot take away any degree, or diploma, or licence, and even if a practitioner is struck off the Medical Register there is nothing in the existing state of the law to prevent such practitioner continuing to practise, provided that he does not use name or title implying that he is registered. Practiti may be removed from the Medical Register (1) if con of felony or misdemeanour in England, or in Ireland, Scotland of any crime or offence, and (2) on being adj by the General Medical Council to have been guil "infamous conduct in a professional respect."

The General Medical Council is, we repeat, prir a body charged with looking after medical educa it is but little concerned with medical politics and matter of fact, the time of the Council is almost er *taken up with considering educational and regist* matters, the latter including the penal cases of re from the Register. The Council at present consists members, of whom, as will be seen by the annexed all but 10 are official representatives of some corporate Five members are chosen by the Crown on the of the Privy Council, and five others are electe the members of the medical profession as Direct sentatives.

President of the General Council.—Dr. Donald MacAl Members of the General Council.—Dr. Norman chosen by the Royal College of Physicians of Lo Mr. Henry Morris, Royal College of Surgeons of Eng Sir Hugh Reeve Beevor, Bart., M.D., Apothecaries' Soc London; Mr. Arthur Thomson, M.B., University of O (vacancy), University of Cambridge; Sir George Philipson, M.D., University of Durham; Dr. Henry Pye-Smith, University of London; Mr. Harry Young, M.B., Victoria University of Manchester Robert Saundby, University of Birmingham; Dr. Ri Caton, University of Liverpool; Dr. Alfred George University of Leeds; and Dr. William Tusting Coc University of Sheffield. Sir John Batty Tuke, M.D., chosen by the Royal College of Physicians of Edinb Dr. James William Beeman Hodsdon, Royal Colle Surgeons of Edinburgh; Dr. John Lindsay Steven, Fa of Physicians and Surgeons of Glasgow; Sir Thomas Ri Fraser, M.D., University of Edinburgh; Dr. D MacAlister, University of Glasgow; Dr. David White Fi University of Aberdeen; and Dr. John Yule Ma University of St. Andrews. Sir John William Moore c by the Royal College of Physicians of Ireland; Sir Th Myles, Royal College of Surgeons in Ireland; Dr. Fr George Adye-Curran, Apothecaries' Hall of Ireland Charles Ball, University of Dublin; and Sir Christopher Nixon, Bart., M.D., Royal University of Ireland. *Nomi* by His Majesty, with the advice of his *Privy* Cou Mr. Charles Sissmore Tomes, Sir William Henry P K.C.B., Sir John Williams, Bart., K.C.V.O., Dr. Caldwell McVail, and Dr. James Little. Electe Direct Representatives Dr. Langley Browne, Dr. H Latimer, Dr. L. S. McManus, Dr. Norman Walker, Dr. Leonard Kidd. Treasurers of the General Co Mr. Charles Sissmore Tomes and Mr. Henry Morris.

THE EDUCATIONAL CURRICULUM.

Professional Education.—The course of professional s after registration shall occupy at least five years. Final Examination in Medicine, Surgery, and Midw must not be passed before the close of the fifth acad year of medical study.

Registration and Preliminary Examination of Me Students.—The following are the General Medical Coun Regulations in reference to the registration of student medicine:—

Every medical student shall be registered in the ma prescribed by the General Medical Council. The registra of medical students shall be placed under the charge of branch registrars. Every person desirous of being regist as a medical student shall apply to the branch registrar of the division of the United Kingdom in which he is residing; and shall produce or forward to the branch registrar a certificate of his having passed a preliminary examination as required by the General Medical Council, and evidence that he has attained the age of 16 years, and has commenced medical study. The branch registrar shall enter the applicant's name and other particulars in the Students' Register and shall give him a certificate of such registration. Each of the branch registrars shall supply to the several licensing bodies, medical schools, and hospitals, in that part of the United Kingdom of which he is registrar, a sufficient number of blank forms of application for the registration of medical students. The commencement of the course of professional study recognised by any of the qualifying bodies shall not be reckoned as dating earlier than 15 days before the date of registration. In addition to the universities and schools of medicine there are many institutions where medical study may be commenced. Applications for special exceptions are dealt with by the Students' Registration Committee, which reports all such cases to the Council.

The Preliminary Examination in General Education, required to be passed previously to registration as a medical student, is as follows:—

1. English language, including grammar and composition. 2. Latin, including grammar, translation from unprescribed Latin books, and translation of English passages into Latin. 3. Mathematics, comprising (*a*) arithmetic, (*b*) algebra, incl [illegible] and (c) geometry, the subject matter of [illegible] with easy deductions. 4. One of the [illegible] (*b*) a modern language.

In many cases the Council will not accept certificates of pass in Preliminary Examination in General Education unless the whole of the subjects included in the Preliminary Examination required by the Council for Registration of Students of Medicine have been passed at the same time.

A degree in Arts of any university of the United Kingdom or of the colonies or a certificate of having passed the final examination for a degree in Arts or Science of any university in the United Kingdom is considered a sufficient testimonial of proficiency.

H. E. Allen, LL.B., Registrar of the General Council and of the Branch Council for England, 299, Oxford-street, London, W.—James Robertson, Registrar of the Branch Council for Scotland, 54, George-square, Edinburgh.—Richard J. E. Roe, Registrar of the Branch Council for Ireland, 35, Dawson-street, Dublin.

THE EXAMINING BODIES.

The following is a list of Examining Bodies whose examinations in general education are recognised by the General Medical Council as qualifying for registration as a medical or dental student.

I.—*Universities in the United Kingdom.*

University of Oxford.—Junior Local Examinations. Senior Local Examinations. Higher Local Examinations. Responsions. Moderations.

University of Cambridge.—Junior Local Examinations. Senior Local Examinations. Higher Local Examinations. Previous Examination. General Examination.

University of Durham.—Matriculation Examination for Science, Letters, and Music. Senior Local Examinations.

University of London.—Matriculation Examination.

Victoria University of Manchester.—Matriculation Examination.

University of Birmingham.—Matriculation Examination.

University of Liverpool.—Matriculation Examination.

University of Leeds.—Matriculation Examination.

University of Wales.—Matriculation Examination.

University of Edinburgh.—Preliminary Examination of the Joint Board of Examiners for Graduation in Arts or Science or Medicine and Surgery.

University of Aberdeen.—Preliminary Examination of the Joint Board of Examiners for Graduation in Arts or Science or Medicine and Surgery.

University of Glasgow.—Preliminary Examination of the Joint Board of Examiners for Graduation in Arts or Science or Medicine and Surgery.

University of St. Andrews.—Preliminary Examination of the Joint Board of Examiners for Graduation in Arts or Science or Medicine and Surgery. Final Examination for the diploma of L.L.A.

University of Dublin.—Public Entrance Examination. Examination for the first, second, third, or fourth year in Arts.

Royal University of Ireland.—This university is in course of dissolution, while the new *Catholic University in Dublin* and the new *University of Belfast* are rising in their stead. The examination in each of the new bodies will be, of course, duly recognised from the beginning.

Oxford and Cambridge Schools Examination Board.—Higher Certificate and School Examinations, Higher Certificate (certificates to include the required subjects).

II.—*Medical Licensing Bodies.*

Royal Colleges of Physicians and Surgeons in Ireland.—Preliminary Examination.

III.—*Educational Bodies other than Universities.*

College of Preceptors.—Examination for a First Class Certificate; Preliminary Examination for Medical Students.

Intermediate Education Board of Ireland.—Middle Grade Examination; Senior Grade Examination.

Educational Institute of Scotland.—Preliminary Medical Examination.

Scottish Education Department.—Leaving Certificates in Lower and Higher Grades and in Honours.

Central Welsh Board.—Senior Certificate Examination.

IV.—*Indian, Colonial, and Foreign Universities and Colleges.*

Every Certificate from Indian, Colonial, and Foreign Universities and Colleges must contain evidence that the Examination has been conducted by or under the authority of the Body granting it, must include all the subjects required by the General Medical Council, and must state that all the subjects of Examination have been passed in at one time; copies of the form of the required Certificate are supplied by the Registrar of the Council for the purpose. In the case of Natives of India or other Oriental countries whose vernacular is other than English an Examination in a Classical Oriental Language may be accepted instead of an Examination in Latin. The German Abiturienten-Examen of the Gymnasia and Real-gymnasia and the examinations entitling to the French diplomas of Bachelier ès Lettres and Bachelier ès Sciences are recognised by the General Medical Council.

The remainder of the curriculum, though all under the supervision of the Council, is in detail in the hands of the various degree- and diploma-granting bodies whose representatives are members of the General Medical Council. In the next pages we give the regulations of the various examining bodies, but it must always be remembered that the examinations are under the supervision of the General Medical Council who visit the various centres in turn and closely inspect the procedure.

REGULATIONS

OF THE

MEDICAL EXAMINING BODIES IN THE UNITED KINGDOM.

UNIVERSITY OF OXFORD.

THERE are two degrees in Medicine, *B.M. and D.M.*, and two degrees in Surgery, *B.Ch. and M.Ch.*

Graduates in Arts (B.A. or M.A.) are alone eligible for these degrees. The most convenient course for the B.A. degree for intending graduates in Medicine is to take Responsions, the Preliminary Science Examinations mentioned below, and the Final Honour School of Physiology. In order to obtain the degrees of B.M. and B.Ch. the following examinations must be passed:—1. Preliminary subjects: Mechanics and Physics, Chemistry, Animal Morphology, and Botany. 2. Professional. (*a*) First Examination: Subjects—Organic Chemistry, unless the candidate has obtained a first or second class in Chemistry in the Natural Science School; Human Physiology, unless he has obtained a first or second class in Animal Physiology in the Natural Science School; Human Anatomy and Materia Medica with Pharmacy. (*b*) Second Examination: Subjects—Medicine, Surgery, Midwifery, Pathology, Forensic Medicine with Hygiene. The approximate dates of the examinations are as follows:—Preliminaries—Mechanics, Physics, and Chemistry, December and June; Animal Morphology, December and *March*; *Botany*, March and June; Professional (First and Second B.M.), June and December.

The First Examination for the degrees of B.M. and B.Ch. may be passed as soon as the Preliminary Scientific Examinations have been completed. The subjects of this examination may be presented separately or in any combination or in any order, provided Anatomy and Physiology be passed together.

The Second Examination may be passed after the completion of the first but Pathology and Hygiene may be taken before or with the remaining subjects. Before admission to the Second Examination candidates must present Certificates of attendance on a course of laboratory instruction in Practical Pathology and Bacteriology and of having acted as post-mortem clerk for three months, surgical dresser for six months, and clinical clerk for six months. Also he must produce certificates of instruction in Infectious and Mental Diseases, and of attendance on Labours, and of proficiency in the practice of Vaccination. Also in respect of the First Examination candidates must present certificates showing that they have dissected the whole body once and have attended courses of laboratory instruction in Practical Histology and Practical Physiology.

The degree of D.M. is granted to Bachelors of Medicine of the University provided they have entered their thirty-ninth term and have composed on some medical subject a dissertation which is approved by the professors in the Faculty of Medicine and examiners for the degree of B.M. whose subject is dealt with. A book published within two years of the candidate's application for the degree may be substituted for a dissertation. The Regius Professor may direct the dissertation to be read in public. The degree of M.Ch. is granted to Bachelors of Surgery of the University who have entered their twenty-seventh term, who are members of the surgical staff of a recognised hospital, or have acted as Dresser or House Surgeon in such a hospital for six months, and who have passed the M.Ch. examination in Surgery, Surgical Anatomy, and Surgical Operations. This examination is held annually, in June, at the end of the Second B.M. Examination.

Travelling Fellowship, &c.[1]—A Radcliffe Travelling Fellowship is awarded annually after an examination held in February. It is tenable for three years and is of the annual value of £200. The stipend is paid by University College. The examination is in Physiology, Pathology, and Hygiene, and is partly "practical." Candidates must be graduates in Medicine of the University. The holder must travel abroad for the purpose of medical study. Application should be made to the Radcliffe Examiners, Radcliffe Library, University Museum. A Rolleston Memorial Prize is awarded once in two years to members of the Universities of Oxford and Cambridge of not more than ten years' standing for an original research in some Biological subject, including Physiology or Pathology. The Radcliffe Prize, founded by University College (1907) is of the value of £50 and is awarded biennially for research in some branch of medical science. The prize will be awarded in 1909. Candidates must send in their memoirs to the University Registry on or before Dec. 1st, 1908. The award will be made in March, 1909. No memoir for which any University prize has already been awarded is admitted to competition for the Radcliffe prize, and the prize will not be awarded more than once to the same candidate.

More detailed information may be obtained from the University Calendar; from the Examination Statutes, 1902, which contain the official schedules of the several subjects of examination in both Arts and Medicine; from the Student's Handbook to the University (all of which are published by the Clarendon Press); from the Regius Professor of Medicine; and from the Professors in the several departments of medical science.

Professors—Anthropology: E. B. Tylor, M.A. Botany (Sherard): S. H. Vines, M.A. Chemistry (Waynflete): W. Odling, M.A. Comparative Anatomy (Linacre); G. C. Bourne, D.Sc. Human Anatomy: A. Thomson, M.A. Medicine (Regius): W. Osler, D.M., Hon. D.Sc., Natural Philosophy (Sedleian): A. E. H. Love, D Sc. Physics (Wykeham): J. S. E. Townsend, M.A. Physiology (Waynflete): F. Gotch, M.A., D.Sc. Reader: J. S. Haldane, M.A. Zoology: E. B. Poulton, M.A., D.Sc. Pathology: G. Dreyer, M.D. Lecturer: E. W. A. Walker, D.M.

In addition to the University lectures and classes the several Colleges provide their undergraduates with tuition for all examinations up to the B.A. degree.

UNIVERSITY OF CAMBRIDGE.

The student must enter at one of the Colleges, or as a non-collegiate student, and keep nine terms (three years) by residence in the University. He must pass the Previous Examination in Classics, Mathematics, &c., which may, and should if possible, be done before coming into residence in October, or he may obtain exemption through the Oxford and Cambridge Schools Examination Board, the Oxford or Cambridge Senior Local Examinations, the London Matriculation Examination, the Scotch Education Department, Responsions at Oxford, and the Joint Matriculation Board of the Universities of Manchester, Liverpool, Leeds, and Sheffield. He may then devote himself to medical study in the University, attending the hospital and the medical lectures, dissecting, &c. Or he may, as nearly all students now do, proceed to take a degree in Arts, either continuing mathematical and classical study and passing the ordinary examinations for B.A. or going out in one of the Honour Triposes. The Natural Sciences Tripos is the most appropriate, as some of the subjects are practically the same as those for the first and second M.B. examinations.

For the degree of *Bachelor of Medicine* (*M.B.*) five years of medical study are required. This time may be spent in Cambridge or at one of the recognised Schools of Medicine. The first three or four years are usually spent in Cambridge, the student remaining in the University till he has passed, say, the examination for the Natural Sciences Tripos and the first and second, and the first part of the third, examinations for M.B. Cambridge being now a complete School of Medicine, all the requisite lectures and hospital practice may be attended here, and many students remain to attend lectures and hospital practice until they have passed the first part of the third examination for M.B. The supply of subjects for Dissection is abundant, and the laboratories for Pathology, Bacteriology, and Pharmacology are well equipped. Addenbrooke's Hospital provides for the necessary clinical training.

There are three examinations for M.B. The *first* includes Chemistry and other branches of Physics and Elementary Biology. These parts may be taken together or separately. The *second* includes Human Anatomy and Physiology. The *third* is divided into two parts—viz., (1) Pharmacology and General Pathology; (2) Principles and Practice of Surgery, Midwifery and Diseases Peculiar to Women, Principles and Practice of Physic. The examinations are partly in writing, partly oral, and partly practical, in the hospital, in the dissecting room, and in the laboratories. An Act has then to be kept in the Public Schools, by the candidate reading an original dissertation composed by himself on some subject approved by the Regius Professor of Physic.

As Operative and Clinical Surgery now form parts of the third M.B. examination candidates who have passed both parts of that examination are admitted to the registrable degree of *Bachelor of Surgery* (*B.C.*) without separate examination and without keeping an Act.

The degree of *Doctor of Medicine* (*M.D.*) may be taken three years after that of M.B. or four years after that of M.A. An Act has to be kept, consisting of an original Thesis sustained in the Public Schools with *vivâ voce* examination; and an extempore essay has to be written on some subject relating to Physiology, Pathology, the Practice of Medicine, or State Medicine.

For the degree of *Master of Surgery* (*M.C.*) the candidate must have passed all the examinations for B.C., or if he is an M.A. have obtained some other registrable qualification in surgery. He is required either (1) to pass an examination in Surgical Anatomy and Surgical Operations, Pathology, and the Principles and Practice of Surgery, and to write an extempore essay on a Surgical Subject; or (2) to submit to the Medical Board original contributions to the advancement of the Science or Art of Surgery. Before he can be admitted to the examination two years at least must have elapsed from the time when he completed all required for the degree of B.C. Before submitting original contributions he must have been qualified at least three years.

University Prize in Medicine.—The Raymond Horton Smith Prize (value £19) is awarded to that candidate for the degree of M D. who presents the best thesis for the degree during the academical year, provided that he has taken honours in a tripos examination.

---

[1] See also scholarship tables, p. 664.

An abstract of the Regulations and Schedules of the range of the examinations in Chemistry, Physics, Biology, Pharmacology, and General Pathology may be obtained upon sending a stamped directed envelope to the Registrary, Cambridge.

Examinations in Tropical Medicine and Hygiene.—Two Examinations in Tropical Medicine and Hygiene are conducted yearly by the State Medicine Syndicate of the University of Cambridge. The examinations are held in Cambridge early in January and in the middle of August. Each examination will extend over four days.

Any person whose name is on the Medical Register is admissible as a candidate to the Examination provided (I.) that a period of not less than 12 months have elapsed between his attainment of a registrable qualification and his admission to the examination; (II.) that he produce evidence, satisfactory to the Syndicate, that he has diligently studied Pathology (including parasitology and bacteriology) in relation to Tropical Diseases, Clinical Medicine, and Surgery at a Hospital for Tropical Diseases, and Hygiene and Methods of Sanitation applicable to Tropical Climates. As evidence of study and attainments a candidate may present to the Syndicate (1) any dissertation, memoir, or other record of work carried out by himself on a subject connected with Tropical Medicine or Hygiene; (2) any Certificate or Diploma in Public Health or Sanitary Science he may have obtained from a recognised Examining Body. Such evidence will be considered by the Syndicate in determining whether he is qualified for admission to the examination and by the examiners in determining whether, if admitted, he shall be included in the list of successful candidates.

The examination will be partly oral and partly practical and will have reference to the nature, incidence, prevention, and treatment of the epidemic and other diseases prevalent in tropical countries. It will comprise the following subjects: 1. The methods of pathological and bacteriological investigation. The examination of the blood. The characters, diagnosis, and life-history of animal and vegetable parasites. The examination, chemical and microscopic, of poisonous or contaminated foods and waters. 2. The origin, pathology, propagation, distribution, prevention, symptoms, diagnosis, and treatment of the epidemic, endemic, and other diseases of tropical climates, including—malaria; blackwater fever; trypanosomiasis; relapsing fever; dengue; yellow fever; plague; tetanus; beri-beri; dysentery and hepatic abscess, cholera, enteric fever, Malta fever, and specific diarrhœal affections of the tropics; diseases due to cestode and other worms; filariasis; bilharzial disease; specific boils, sores, and other cutaneous affections; mycetoma; ophthalmic affections of the tropics; affections caused by poisonous plants and animals, and by poisoned weapons; sunstroke. 3. The general effects on health in the tropics of seasons and climate, soil, water, and food. Personal hygiene. acclimatisation. Principles of general hygiene, with special reference to food- and water-supplies, sites, dwellings, drainage, and the disposal of refuse. The sanitation of native quarters, camps, plantations, factories, hospitals, asylums, jails, pilgrim, and coolie ships. Principles and methods of disinfection.

Every candidate who passes the examination to the satisfaction of the examiners will receive from the University a diploma testifying to his knowledge and skill in tropical medicine and hygiene.

The fee for the examination is £9 9s., and all applications for information should be addressed to Professor G. H. F. Nuttall, F.R.S., 3, Cranmer-road, Cambridge.

The Professors, Readers, and Lecturers in the various subjects are as follows. Professors—Anatomy: A. Macalister, M.D. Biology (Quick): G H. F. Nuttall, Sc.D. Botany: A. C. Seward, M.A. Chemistry: (vacant). Medicine (Downing): J. B. Bradbury, M.D. Natural Philosophy (Jacksonian): Sir James Dewar, M.A. Pathology: G. Sims Woodhead, M.A. Physic (Regius): T. Clifford Allbutt, M.D. Physiology: J. N. Langley, M.A. Surgery: F. H. Marsh, M.A. Zoology, &c.: A. Sedgwick, M.A. Readers—Botany: F. F. Blackman, M.A. Chemical Physiology: F. G. Hopkins, M.A., and A. E. Shipley, M.A. Lecturers—Physics: G. F. C. Searle, M.A., and C. T. R. Wilson, M.A. Botany: A. G. Tansley, M.A. Chemistry: Dr. Sell and Dr. Fenton. Organic Chemistry: S. Ruhemann, M.A. Advanced Morphology of Vertebrates: H. Gadow, M.A. Advanced Morphology of Invertebrates: A. E. Shipley, M.A. Advanced Physiology: W. H. Gaskell, M.D., and L. E. Shore, M.D. Physiology: H. K. Anderson, M.D. Physiological and Experimental Psychology: W. H. Rivers, M.A. Medical Jurisprudence: B. Anningson, M.D. Medicine: L. Humphry, M.D. Midwifery: A. C. Ingle, M.D. Surgery: G. E. Wherry, M.A., F.R.C.S. Pathology (Huddersfield): T. S. P. Strangeways, M.A. Physiological Anthropology: W. L. H. Duckworth, M.D.

UNIVERSITY OF LONDON.

The University of London was established by Royal Charter in 1836 as a purely examining and degree conferring body with several affiliated colleges but no direct teaching functions. In 1900 it was reconstituted under the Act of Parliament 1898 and became a teaching body. Many schools already existing became constituent colleges, including all the metropolitan medical schools. It is necessary that the teachers in these should be recognised and approved by the Senate as conducting work of university rank, and in this way the University may be said to have benefited the whole of medical education in London. It also appoints teachers in special subjects to give lectures at the University and the question of a further centralisation of preliminary scientific studies is at present occupying the very serious attention of the University and its constituent schools. The medical degrees awarded by the University are those of M.D., M.S.. and M.B., B.S., the two latter being now given together as a graduating degree, whereas formerly the M.B. alone was a qualifying degree and the B.S. was taken optionally as a separate examination. The medical degrees of the University of London are granted to both internal and external students, the former being students of the constituent schools and colleges of the University.

Teaching Staff.—The teaching staff of the University is organised under two heads: 1. Appointed teachers—i.e., such as are appointed by, and are paid out of the funds of, the University. 2. Recognised teachers—i.e., those who have been appointed and are paid by the several schools of the University and other institutions at which instruction is given under the auspices of the University, and who have been recognised by the Senate as conducting work of University standard. Thus in the Faculty of Medicine, although there are at present no appointed teachers, there are 401 recognised teachers belonging to the various metropolitan medical schools. In the Faculty of Science J. N. Collie, Ph.D., F.R.S., and S. Smiles, D.Sc., are the appointed teachers in Organic Chemistry; Sir William Ramsay, Ph.D., F.R.S., and N. T. M. Wilsmore, M.Sc., are appointed teachers in General Chemistry; and A. D. Waller, M.D., F.R.S., who is Dean of the Faculty and also Director of the Physiological Laboratory, is the appointed teacher in Physiology, and E. A. Minchin, M.A., in Protozoology. There are 212 recognised teachers in the Faculty of Science. The lecturers in the Medical Sciences and the professors in the Faculties of Medicine in King's College, London, and University College, London, will be found enumerated under their respective medical schools.

Internal and External Students.—Students of the University may be either internal or external. Internal students are those who have matriculated at the University and are studying in a school or schools or under one or more of the teachers of the University. The medical schools in question are those connected with University College Hospital. King's College Hospital, St. Bartholomew's Hospital, the London Hospital, Guy's Hospital, St. Thomas's Hospital, St. George's Hospital, the Middlesex Hospital, St. Mary's Hospital, Charing Cross Hospital, Westminster Hospital, and the London (Royal Free Hospital) School of Medicine for Women. The London School of Tropical Medicine and the Lister Institute of Preventive Medicine are also recognised as schools of the University in special departments. External students are those who undertake approved courses of study at schools recognised by the University but not belonging to it.

The Matriculation Examination.—Students before being admitted to the University must either (1) have passed the Matriculation or the School Examination (Matriculation or Higher Standard), or (2) have been exempted therefrom under Statute 116 of the University which recognises certain other examinations in its lieu. The examinations take place three times in each year—namely, on Sept. 15th (if that day be a Monday, or if not, on the Monday next preceding the 15th), on the second Monday in January, and on the second Monday in June (or July, as may be hereafter

The First Examination for the degrees of B.M. and B.Ch. may be passed as soon as the Preliminary Scientific Examinations have been completed. The subjects of this examination may be presented separately or in any combination or in any order, provided Anatomy and Physiology be passed together.

The Second Examination may be passed after the completion of the first but Pathology and Hygiene may be taken before or with the remaining subjects. Before admission to the Second Examination candidates must present Certificates of attendance on a course of laboratory instruction in Practical Pathology and Bacteriology and of having acted as post-mortem clerk for three months, surgical dresser for six months, and clinical clerk for six months. Also he must produce certificates of instruction in Infectious and Mental Diseases, and of attendance on Labours, and of proficiency in the practice of Vaccination. Also in respect of the First Examination candidates must present certificates showing that they have dissected the whole body once and have attended courses of laboratory instruction in Practical Histology and Practical Physiology.

The degree of D.M. is granted to Bachelors of Medicine of the University provided they have entered their thirty-ninth term and have composed on some medical subject a dissertation which is approved by the professors in the Faculty of Medicine and examiners for the degree of B.M. whose subject is dealt with. A book published within two years of the candidate's application for the degree may be substituted for a dissertation. The Regius Professor may direct the dissertation to be read in public. The degree of M.Ch. is granted to Bachelors of Surgery of the University who have entered their twenty-seventh term, who are members of the surgical staff of a recognised hospital, or have acted as Dresser or House Surgeon in such a hospital for six months, and who have passed the M.Ch. examination in Surgery, Surgical Anatomy, and Surgical Operations. This examination is held annually, in June, at the end of the Second B.M. Examination.

Travelling Fellowship, &c.[1]—A Radcliffe Travelling Fellowship is awarded annually after an examination held in February. It is tenable for three years and is of the annual value of £200. The stipend is paid by University College. The examination is in Physiology, Pathology, and Hygiene, and is partly "practical." Candidates must be graduates in Medicine of the University. The holder must travel abroad for the purpose of medical study. Application should be made to the Radcliffe Examiners, Radcliffe Library, University Museum. A Rolleston Memorial Prize is awarded once in two years to members of the Universities of Oxford and Cambridge of not more than ten years' standing for an original research in some Biological subject, including Physiology or Pathology. The Radcliffe Prize, founded by University College (1907) is of the value of £50 and is awarded biennially for research in some branch of medical science. The prize will be awarded in 1909. Candidates must send in their memoirs to the University Registry on or before Dec. 1st, 1908. The award will be made in March, 1909. No memoir for which any University prize has already been awarded is admitted to competition for the Radcliffe prize, and the prize will not be awarded more than once to the same candidate.

More detailed information may be obtained from the University Calendar; from the Examination Statutes, 1902, which contain the official schedules of the several subjects of examination in both Arts and Medicine; from the Student's Handbook to the University (all of which are published by the Clarendon Press); from the Regius Professor of Medicine; and from the Professors in the several departments of medical science.

Professors—Anthropology: E. B. Tylor, M.A. Botany (Sherard): S. H. Vines, M.A. Chemistry (Waynflete): W. Odling, M.A. Comparative Anatomy (Linacre); G. C. Bourne, D.Sc. Human Anatomy: A. Thomson, M.A. Medicine (Regius): W. Osler, D.M., Hon. D.Sc., Natural Philosophy (Sedleian): A. E. H. Love, D Sc. Physics (Wykeham): J. S. E. Townsend, M.A. Physiology (Waynflete): F. Gotch, M.A., D.Sc. Reader: J. S. Haldane, M.A. Zoology: E. B. Poulton, M.A., D.Sc. Pathology: G. Dreyer, M.D. Lecturer: E. W. A. Walker, D.M.

In addition to the University lectures and classes the several Colleges provide their undergraduates with tuition for all examinations up to the B.A. degree.

UNIVERSITY OF CAMBRIDGE.

The student must enter at one of the Colleges, or as a non-collegiate student, and keep nine terms (three years) by residence in the University. He must pass the Previous Examination in Classics, Mathematics, &c., which may, and should if possible, be done before coming into residence in October, or he may obtain exemption through the Oxford and Cambridge Schools Examination Board, the Oxford or Cambridge Senior Local Examinations, the London Matriculation Examination, the Scotch Education Department, Responsions at Oxford, and the Joint Matriculation Board of the Universities of Manchester, Liverpool, Leeds, and Sheffield. He may then devote himself to medical study in the University, attending the hospital and the medical lectures, dissecting, &c. Or he may, as nearly all students now do, proceed to take a degree in Arts, either continuing mathematical and classical study and passing the ordinary examinations for B.A. or going out in one of the Honour Triposes. The Natural Sciences Tripos is the most appropriate, as some of the subjects are practically the same as those for the first and second M.B. examinations.

For the degree of *Bachelor of Medicine* (*M.B.*) five years of medical study are required. This time may be spent in Cambridge or at one of the recognised Schools of Medicine. The first three or four years are usually spent in Cambridge, the student remaining in the University till he has passed, say, the examination for the Natural Sciences Tripos and the first and second, and the first part of the third, examinations for M.B. Cambridge being now a complete School of Medicine, all the requisite lectures and hospital practice may be attended here, and many students remain to attend lectures and hospital practice until they have passed the first part of the third examination for M.B. The supply of subjects for Dissection is abundant, and the laboratories for Pathology, Bacteriology, and Pharmacology are well equipped. Addenbrooke's Hospital provides for the necessary clinical training.

There are three examinations for M.B. The *first* includes Chemistry and other branches of Physics and Elementary Biology. These parts may be taken together or separately. The *second* includes Human Anatomy and Physiology. Th *third* is divided into two parts—viz., (1) Pharmacology an General Pathology; (2) Principles and Practice of Surger Midwifery and Diseases Peculiar to Women, Principle and Practice of Physic. The examinations are partly i writing, partly oral, and partly practical, in the hospital in the dissecting room, and in the laboratories. A Act has then to be kept in the Public Schools, by th candidate reading an original dissertation composed b himself on some subject approved by the Regius Professo of Physic.

As Operative and Clinical Surgery now form parts of th third M.B. examination candidates who have passed bot parts of that examination are admitted to the registrabl degree of *Bachelor of Surgery* (*B.C.*) without separat examination and without keeping an Act.

The degree of *Doctor of Medicine* (*M.D.*) may be take three years after that of M.B. or four years after that o M.A. An Act has to be kept, consisting of an original Thesi sustained in the Public Schools with *vivâ voce* examination and an extempore essay has to be written on some subjec relating to Physiology, Pathology, the Practice of Medicine, or State Medicine.

For the degree of *Master of Surgery* (*M.C.*) the candidat must have passed all the examinations for B.C., o if he is an M.A. have obtained some other registrable qualification in surgery. He is required either (1) to pass an examination in Surgical Anatomy and Surgical Operations, Pathology, and the Principles and Practice of Surgery, and to write an extempore essay on a Surgical Subject; or (2) to submit to the Medical Board original contributions to the advancement of the Science or Art of Surgery. Before he can be admitted to the examination two years at least must have elapsed from the time when he completed all required for the degree of B.C. Before submitting original contributions he must have been qualified at least three years.

University Prize in Medicine.—The Raymond Horton Smith Prize (value £19) is awarded to that candidate for the degree of M D. who presents the best thesis for the degree during the academical year, provided that he has taken honours in a tripos examination.

---

[1] See also scholarship tables, p. 664.

An abstract of the Regulations and Schedules of the range of the examinations in Chemistry, Physics, Biology, Pharmacology, and General Pathology may be obtained upon sending a stamped directed envelope to the Registrary, Cambridge.

Examinations in Tropical Medicine and Hygiene.—Two Examinations in Tropical Medicine and Hygiene are conducted yearly by the State Medicine Syndicate of the University of Cambridge. The examinations are held in Cambridge early in January and in the middle of August. Each examination will extend over four days.

Any person whose name is on the Medical Register is admissible as a candidate to the Examination provided (I.) that a period of not less than 12 months have elapsed between his attainment of a registrable qualification and his admission to the examination; (II.) that he produce evidence, satisfactory to the Syndicate, that he has diligently studied Pathology (including parasitology and bacteriology) in relation to Tropical Diseases, Clinical Medicine, and Surgery at a Hospital for Tropical Diseases, and Hygiene and Methods of Sanitation applicable to Tropical Climates. As evidence of study and attainments a candidate may present to the Syndicate (1) any dissertation, memoir, or other record of work carried out by himself on a subject connected with Tropical Medicine or Hygiene; (2) any Certificate or Diploma in Public Health or Sanitary Science he may have obtained from a recognised Examining Body. Such evidence will be considered by the Syndicate in determining whether he is qualified for admission to the examination and by the examiners in determining whether, if admitted, he shall be included in the list of successful candidates.

The examination will be partly oral and partly practical and will have reference to the nature, incidence, prevention, and treatment of the epidemic and other diseases prevalent in tropical countries. It will comprise the following subjects: 1. The methods of pathological and bacteriological investigation. The examination of the blood. The characters, diagnosis, and life-history of animal and vegetable parasites. The examination, chemical and microscopic, of poisonous or contaminated foods and waters. 2. The origin, pathology, propagation, distribution, prevention, symptoms, diagnosis, and treatment of the epidemic, endemic, and other diseases of tropical climates, including—malaria; blackwater fever; trypanosomiasis; relapsing fever; dengue; yellow fever; plague; tetanus; beri-beri; dysentery and hepatic abscess, cholera, enteric fever, Malta fever, and specific diarrhœal affections of the tropics; diseases due to cestode and other worms; filariasis; bilharzial disease; specific boils, sores, and other cutaneous affections; mycetoma; ophthalmic affections of the tropics; affections caused by poisonous plants and animals, and by poisoned weapons; sunstroke. 3. The general effects on health in the tropics of seasons and climate, soil, water, and food. Personal hygiene. acclimatisation. Principles of general hygiene, with special reference to food- and water-supplies, sites, dwellings, drainage, and the disposal of refuse. The sanitation of native quarters, camps, plantations, factories, hospitals, asylums, jails, pilgrim, and coolie ships. Principles and methods of disinfection.

Every candidate who passes the examination to the satisfaction of the examiners will receive from the University a diploma testifying to his knowledge and skill in tropical medicine and hygiene.

The fee for the examination is £9 9*s*., and all applications for information should be addressed to Professor G. H. F. Nuttall, F.R.S., 3, Cranmer-road, Cambridge.

The Professors, Readers, and Lecturers in the various subjects are as follows. Professors—Anatomy: A. Macalister, M.D. Biology (Quick): G H. F. Nuttall, Sc.D. Botany: A. C. Seward, M.A. Chemistry: (vacant). Medicine (Downing): J. B. Bradbury, M.D. Natural Philosophy (Jacksonian): Sir James Dewar, M.A. Pathology: G. Sims Woodhead, M.A. Physic (Regius): T. Clifford Allbutt, M.D. Physiology: J. N. Langley, M.A. Surgery: F. H. Marsh, M.A. Zoology, &c.: A. Sedgwick, M.A. Readers—Botany: F. F. Blackman, M.A. Chemical Physiology: F. G. Hopkins, M.A., and A. E. Shipley, M.A. Lecturers—Physics: G. F. C. Searle, M.A., and C. T. R. Wilson, M.A. Botany: A. G. Tansley, M.A. Chemistry: Dr. Sell and Dr. Fenton. Organic Chemistry: S. Ruhemann, M.A. Advanced Morphology of Vertebrates: H. Gadow, M.A. Advanced Morphology of Invertebrates: A. E. Shipley, M.A. Advanced Physiology: W H. Gaskell, M.D., and L. E. Shore, M.D. Physiology: H. K. Anderson, M.D. Physiological and Experimental Psychology: W. H. Rivers, M.A. Medical Jurisprudence: B. Anningson, M.D. Medicine: L. Humphry, M.D. Midwifery: A. C. Ingle, M.D. Surgery: G. E. Wherry, M.A., F.R.C.S. Pathology (Huddersfield): T. S. P. Strangeways, M.A. Physiological Anthropology: W. L. H. Duckworth, M.D.

UNIVERSITY OF LONDON.

The University of London was established by Royal Charter in 1836 as a purely examining and degree conferring body with several affiliated colleges but no direct teaching functions. In 1900 it was reconstituted under the Act of Parliament 1898 and became a teaching body. Many schools already existing became constituent colleges, including all the metropolitan medical schools. It is necessary that the teachers in these should be recognised and approved by the Senate as conducting work of university rank, and in this way the University may be said to have benefited the whole of medical education in London. It also appoints teachers in special subjects to give lectures at the University and the question of a further centralisation of preliminary scientific studies is at present occupying the very serious attention of the University and its constituent schools. The medical degrees awarded by the University are those of M.D., M.S., and M.B., B.S., the two latter being now given together as a graduating degree, whereas formerly the M.B. alone was a qualifying degree and the B.S. was taken optionally as a separate examination. The medical degrees of the University of London are granted to both internal and external students, the former being students of the constituent schools and colleges of the University.

Teaching Staff.—The teaching staff of the University is organised under two heads: 1. Appointed teachers—i.e., such as are appointed by, and are paid out of the funds of, the University. 2. Recognised teachers—i.e., those who have been appointed and are paid by the several schools of the University and other institutions at which instruction is given under the auspices of the University, and who have been recognised by the Senate as conducting work of University standard. Thus in the Faculty of Medicine, although there are at present no appointed teachers, there are 401 recognised teachers belonging to the various metropolitan medical schools. In the Faculty of Science J. N. Collie, Ph.D., F.R.S., and S. Smiles, D.Sc., are the appointed teachers in Organic Chemistry; Sir William Ramsay, Ph.D., F.R.S., and N. T. M. Wilsmore, M.Sc., are appointed teachers in General Chemistry; and A. D. Waller, M.D., F.R.S., who is Dean of the Faculty and also Director of the Physiological Laboratory, is the appointed teacher in Physiology, and E. A. Minchin, M.A., in Protozoology. There are 212 recognised teachers in the Faculty of Science. The lecturers in the Medical Sciences and the professors in the Faculties of Medicine in King's College, London, and University College, London, will be found enumerated under their respective medical schools.

Internal and External Students.—Students of the University may be either internal or external. Internal students are those who have matriculated at the University and are studying in a school or schools or under one or more of the teachers of the University. The medical schools in question are those connected with University College Hospital, King's College Hospital, St. Bartholomew's Hospital, the London Hospital, Guy's Hospital, St. Thomas's Hospital, St. George's Hospital, the Middlesex Hospital, St. Mary's Hospital, Charing Cross Hospital, Westminster Hospital, and the London (Royal Free Hospital) School of Medicine for Women. The London School of Tropical Medicine and the Lister Institute of Preventive Medicine are also recognised as schools of the University in special departments. External students are those who undertake approved courses of study at schools recognised by the University but not belonging to it.

The Matriculation Examination.—Students before being admitted to the University must either (1) have passed the Matriculation or the School Examination (Matriculation or Higher Standard), or (2) have been exempted therefrom under Statute 116 of the University which recognises certain other examinations in its lieu. The examinations take place three times in each year—namely, on Sept. 15th (if that day be a Monday, or if not, on the Monday next preceding the 15th), on the second Monday in January, and on the second Monday in June (or July, as may be hereafter determined). The examinations in January and June (or July), but not that in September. may be held not only at the University of London, but also, under special arrangement, in other parts of the United Kingdom or in the colonies. (Neither Botany nor Drawing can be chosen for subjects in the Colonies.) It is noteworthy that the September examination affords an opportunity for prospective medical students who may have failed at the midsummer examination to pass the Matriculation in time to enter upon their medical course in October. Every candidate must, on or before August 20th for the September examination, on or before Nov. 25th for the January examination, and on or before April 25th for the June (or July) examination, apply by postcard to the Principal for a form of entry, of which the first in order must be returned 14 days before the commencement of the September examination, the second on or before Dec. 1st, and the third on or before May 1st, accompanied in the same cover by a certificate showing that the candidate has completed his sixteenth year, and by his fee for the examination. A certificate from the Registrar-General in London or from the superintendent registrar of the district, or a certified copy of the baptismal register, or a declaration of the candidate's age, made before a magistrate by his parent or guardian, or by the candidate if of full age, will be accepted. As candidates cannot be admitted after the list is closed any candidate who may not have received a form of entry within a week after applying for it should communicate immediately with the Principal, stating the exact date of his application and the place where it was posted. Every candidate must pay a fee of £2. If he withdraws his name before the last day of entry it shall be returned to him. If he fails to present himself he shall be allowed to enter for a subsequent Matriculation within eight months on payment of £1. If he retires after the commencement of the examination or fails to pass it the full fee of £2 shall be payable on every re-entry. Candidates must show a competent knowledge of each of the following five subjects, according to the details specified: 1. English—Composition, Précis-writing, salient facts in English History and Geography. A subject for an essay, to be chosen by candidates, to test power of expression, thought and arrangement and general knowledge. 2. Elementary Mathematics—Arithmetic, Algebra (including quadratic equations and graphs of simple functions), and the subjects of Euclid (Books I. to IV.). 3. Latin, or Elementary Mechanics, or Elementary Physics (Heat, Light, and Sound), or Elementary Chemistry, or Elementary Botany. 4 and 5. Two of the following subjects. neither of which has been taken under Section 3 (if Latin be not taken one of the other subjects must be another language from the list): Latin, Greek, French, German, Ancient History, Modern History, Logic, Physical and General Geography, Geometrical and Mechanical Drawing, Mathematics (more advanced), Elementary Mechanics, Elementary Chemistry, Elementary Physics (Heat, Light, and Sound), Elementary Physics (Electricity and Magnetism), and Botany. Additional subjects, of which, however, candidates must give notice two months previous to the examination, are: Arabic, Sanskrit, Spanish, Portuguese, Italian, Hebrew, Chinese, Modern Dutch, and Zoology. A pass certificate signed by the Principal is delivered to each successful candidate after the report of the examiners shall have been approved by the Senate.

Provincial Examinations for Matriculation.—These examinations are appointed by the Senate from time to time upon the application of any city, institution, or college desiring to be named as a local centre for one or more examinations and are carried on simultaneously with the examinations in London under the supervision of sub-examiners also appointed by the Senate. Candidates wishing to be examined at any provincial centre must give notice upon their forms of entry to the Principal of the University, who will then make all necessary arrangements. Besides the University fee, a fee usually varying from £1 to £3 is charged by the local authorities and must be paid *at the local centre* immediately before the commencement of the several examinations.

Bachelor of Medicine and Surgery.—[N.B. The regulations immediately following have undergone radical revision and will only remain in force until July, 1909. The revised regulations which will obtain after that date are summarised later.]

A. Internal Students.—In order to be admitted to the Bachelor's degrees a student must normally, after registration as an internal student, have: (1) attended prescribed courses of study for five years in one or more schools of the University; and (2) passed the following examinations: Preliminary Scientific Examination, Part I. (Inorganic Chemistry, Physics, and Biology), to be passed, as a rule, not less than one academic year after matriculation;[2] Preliminary Scientific Examination, Part II. (Organic Chemistry), to be passed not less than six months after Part I. of the Preliminary Scientific Examination; Intermediate Examination in Medicine (Anatomy, Physiology, and Pharmacology, including Pharmacy and Materia Medica), to be passed not less than two years after Part I., and not less than one year after Part II. of the Preliminary Scientific Examination; Final Examination (Medicine Surgery, Midwifery, and Diseases of Women, Pathology, Forensic Medicine, and Hygiene), to be passed not less than two academic years after passing in Anatomy and Physiology at the Intermediate Examination and not less than five years after Matriculation.[2]

B. External Students.—To be admitted to the Bachelor's degrees an external student must (1) have passed the Matriculation examination or have been exempted therefrom under Statute 116 not less than five years previously; (2) have passed four subsequent examinations similar to those required of an internal student; and (3) have been engaged in their professional studies during five years subsequent to Matriculation and four years subsequent to their passing the Preliminary Scientific Examination, Part I., at one or more of the medical institutions or schools recognised by this University for the purpose, one year at least of the four to have been spent in one or more of the recognised institutions or schools in the United Kingdom.

Preliminary Scientific Examination.—[N.B The last examination under these regulations will be held in January, 1909.] The Preliminary Scientific Examination, Part I. (Inorganic Chemistry, Physics, and Biology), will take place twice in each year, commencing on the third Monday in January and on the second Monday in July. It must be passed by internal students not less than one academic year after matriculation and by external students not less than nine months after matriculation. Every candidate must apply (internal students to the academic registrar and external students to the external registrar) for a Form of Entry on or before May 24th or Dec. 5th, which must be returned, accompanied by the proper fee, not later than June 1st for the July examination or Dec. 12th for the January examination. The fee is £5 for each entry to the whole examination, provided that all the subjects are taken at one time. When less than the whole examination is taken at one time it is £2 for each subject. The examination will include papers, practical work, and oral questions on Inorganic Chemistry, Physics, Botany, and Zoology. Candidates must present themselves either (1) in Inorganic Chemistry, Physics, and Biology; or (2) in Inorganic Chemistry and Physics; or (3) in Biology. If they fail in any one subject they may present themselves for re-examination in that subject alone, provided that if they fail in both inorganic chemistry and physics they must present themselves for re-examination in these two subjects taken together. Part II. of the Preliminary Scientific Examination will take place twice in each year, commencing on the Thursdays following the third Monday in January and the second Monday in July. No candidate will be admitted to this examination within six months of having passed Part I. Every candidate must apply (internal students to the academic registrar and external students to the external registrar) on or before May 24th or Dec. 5th for a form of entry, which must be returned not later than June 1st for the July examination or Dec. 12th for the January examination. No fee will be charged for a first entry, but £2 will be charged for each subsequent entry. The examination will include a paper, practical work, and oral questions in Organic Chemistry.

Intermediate Examination in Medicine. [N B The la examination under these regulations will be held in Januar 1909.]—The Intermediate examination in Medicine tak place twice in each year, commencing on the third Mond in January and on the first Monday in July The subjec of the examination are Anatomy, Physiology and Histolog and Pharmacology, including Materia Medica. No candidat shall be admitted to this examination unless he have passe Part I. of the Preliminary Scientific examination at least tw years previously and Part II. at least one year previousl

---

[2] With certain exemptions.

Internal students must have completed the second and third years' course of study prescribed for them by the University and external students must produce certificates of having subsequently to having passed Part I. of the Preliminary Scientific examination been a student during two years at one or more of the medical institutions or schools recognised by this University and of having attended (1) a course of not less than 100 lectures on Human Anatomy; (2) a course of Dissections for not less than 12 months; (3) a course of not less than 60 lectures on Physiology; (4) courses of Experimental Physiology, Histology, and Physiological Chemistry for not less than three months each; (5) lectures and demonstrations on Pharmacology, Pharmacy, and Materia Medica for not less than three months; and (6) Practical Pharmacy for not less than two months. These certificates (as is the case also with all the certificates hereinafter mentioned) must be transmitted to the Registrar at least four weeks before the commencement of the examination. The fee for each entry to the whole examination is £10. For re-examination in one subject it is £5.

M.B., B.S. Examination.—The M.B., B.S. examination takes place twice in each year, commencing on the last Monday in October and on the first Monday in May. No candidate will be admitted to this examination within two academic years from the date of passing the Intermediate examination. Bachelors of Medicine of this University who graduated in or before May, 1904, may obtain the B.S. degree by passing the Surgical part of the M.B., B.S. examination. Every candidate must produce certificates of having passed the intermediate examination and of having subsequently attended courses of instruction in (1) Principles and Practice of Medicine, including a two months' course of instruction at a recognised Fever Hospital; (2) Clinical Methods and Physical Diagnosis; (3) Insanity (with clinical demonstrations at a recognised Asylum); (4) Therapeutics; (5) Vaccination; (6) Principles and Practice of Surgery; (7) Operative Surgery, Surgical Anatomy, Practical Surgery, and the Administration of Anæsthetics; (8) Diseases of the Eye, Ear, and Throat; (9) Midwifery and Diseases of Women; (10) Practical Midwifery, the conduct of at least 20 Labours, and practice as a Clinical clerk in Gynæcological work; (11) Pathology and Bacteriology; (12) work of the Post-mortem room; (13) Forensic Medicine; and (14) Hygiene. He must also have attended the Medical and Surgical practice of a recognised hospital for two years and a fever hospital for two months. He must have had clinical instruction and must have held the posts of medical clinical clerk and surgical dresser for periods of six months each. For internal students the above form the subjects of the fourth and fifth years of study as prescribed by the University. Candidates will be examined in Medicine (including Therapeutics and Mental Diseases), Pathology, Forensic Medicine and Hygiene, Surgery, Midwifery, and Diseases of Women. The subjects may be divided into two groups—namely: (1) Medicine, Pathology, Forensic Medicine, and Hygiene; and (2) Surgery, Midwifery, and Diseases of Women. These groups may be taken either separately or together. The fee is £10 for each entry to the whole examination and £5 for examination or re-examination in either group. There will be no separate examination held for Honours but the list of candidates who have passed will be published in two parts—namely, an Honours list and a Pass list

Doctor of Medicine.—The examination for this degree takes place twice in each year, commencing on the first Monday in December and on the first Monday in July. Candidates must have taken the degrees of M.B., B.S. not less than two years previously, but for those who have taken the M.B., B.S. degrees with *Honours* or have done certain original work this period of delay may be reduced to one year. Candidates who have obtained their M.B. degrees in or before May, 1904, will not be required to hold the degree of B.S. before seeking the doctorate. They may present themselves for examination in one of the following branches, namely: (1) Medicine; (2) Pathology; (3) Mental Diseases; (4) Midwifery and Diseases of Women; (5) State Medicine; and (6) Tropical Medicine. Certain conditions have to be fulfilled in each case, varying according to the nature of the branch in question. Candidates who have passed or presented themselves for the M.D. examination in one branch may present themselves for examination in another branch at a subsequent examination. Any candidate for the degree of M.D. may transmit to the Registrar, not less than two months before the commencement of the examination, a thesis or published work having definite relation to the branch of Medicine in which he is a candidate, and if the thesis be approved by the examiners the candidate may be exempted from the written examination. The fee is £20, and for re-examination £10.

Master in Surgery.—The examination for the degree of Master in Surgery takes place twice in each year and commences on the first Monday in December and on the first Monday in July. Candidates must produce certificates of having taken the degrees of M.B. and B.S. not less than two years previously (with certain exemptions, as in the examination for the M.D.) and of having subsequently held for at least six months a resident or non-resident Surgical hospital appointment. The examination is conducted by means of printed papers and *vivâ-voce* interrogation, and the subjects are Surgery, Surgical Pathology and Anatomy, a Clinical examination, and operations on the dead body. Any candidate for the degree of M.S. may transmit to the Registrar, not later than two months before the commencement of the examination, a thesis or published work having definite relation to Surgery, and if the thesis be approved by the examiners the candidate may be exempted from the written examination in Surgery. The fee is £20.

Full details of the prescribed curricula of study, with the syllabus for each examination and of certain exemptions which the Senate has power to grant in respect to certain examinations and the courses of study presented for them, and the names of the recognised Internal and External Schools of the University, can be obtained from the Academic Registrar, University of London, S.W.

On and after July 1st, 1909, a new set of regulations, which have been framed recently by the Senate, will come into force for the medical degree of London University. Their chief distinctions from the present *régime* are as follows:—

In order to be admitted to the degrees of M.B., B.S., (*a*) an internal student must, after his resignation, have attended prescribed courses of study for *five and a half years* in one or more schools of the University; and (*b*) an external student must have passed the Matriculation Examination (or obtained exemption therefrom) not less than *five and a half years* previously. Both internal and external students must further have passed the following subsequent examinations, after having presented certificates of having fulfilled the respective courses of study prescribed in the syllabus for each.

1. *The First Examination for Medical Degrees.*—In Chemistry, Physics, and General Biology (corresponding to the present Preliminary Scientific Examination, Part I.). To be passed by (*a*) internal students not less than one academic year after matriculation; and (*b*) external students not less than nine months after matriculation. (Examination fee £5.) Candidates must at their first entry present themselves in all three subjects but may be re-examined in one subject if they fail in that subject only. (Fee £2.)

2. *The Second Examination for Medical Degrees.*—To be passed in two parts as follows: Part I., in Organic Chemistry (corresponding to the present Preliminary Scientific Examination, Part II.), not less than six months after completing the first examination (fee £2); and Part II., in Human Anatomy and Embryology, Physiology, and Pharmacology, including Pharmacy and Materia Medica (which corresponds to the present Intermediate Examination in Medicine), after passing Part I. of the second examination and not less than 18 months after completing the first examination. (Fee £8.) Candidates who fail in one subject alone may be re-examined in that subject. (Fee £4.)

3. *The Third Examination for Medical Degrees*, or M.B., B.S. examination (corresponding in every way to the present M.B., B.S. examination and comprising the same subjects in the same groups), to be passed not less than three years after passing in Anatomy and Physiology at the second examination, Part II. (Fee £10.) The regulations for the M.D. and M.S. degrees remain unaltered.

It will be thus seen that the results of the revision of the curriculum will be to extend its duration by *six months* and that in the future candidates for medical degrees at London University will spend two and a *half* years in studying for their first two examinations and three years in their clinical studies, whereas at present their course is allotted in the ratio of three years to two years in favour of the preliminary studies.

The course of study of the subjects for the first examination have been modified. They are to be treated "in a general manner and with regard to the subsequent work of the student." The latter instruction is also applied to the practical course of experimental and physiological chemistry. The course in Biology, which has been planned to afford "a general introduction to the science of life," will require less knowledge of detail than at present. In future 60 lectures and 120 hours' practical work will be required in Biology, in place of the present 100 lectures and 140 hours' practical work respectively. Practical work in Physics will occupy 60 instead of the present 120 hours, and in the study of Organic Chemistry 20 hours will be taken from the lectures and added to the experimental work. The curricula for Anatomy, Pharmacology, and Materia Medica and for the subjects of the final examination remain unaltered, and may be obtained from the Academic Registrar at the University.

UNIVERSITY OF DURHAM.

One Diploma and six degrees are conferred—viz., the Diploma in Public Health and the degrees of Bachelor of Medicine, Bachelor of Surgery, Master of Surgery, Doctor of Medicine, Bachelor of Hygiene, and Doctor of Hygiene. These degrees are open both to Men and Women.

For the degree of *Bachelor of Medicine* there are four professional examinations. The subjects of the First Examination are—Elementary Anatomy and Elementary Biology, Chemistry, and Physics. The subjects of the Second Examination are—Anatomy, Physiology, Materia Medica, Therapeutics, Pharmacology, Pharmacy. The subjects for the Third Examination are—Pathology, Medical Jurisprudence, Public Health, and Elementary Bacteriology. The subjects of the Fourth Examination are—Medicine, Clinical Medicine and Psychological Medicine, Surgery and Clinical Surgery, Midwifery and Diseases of Women and Children.

It is required that at least one of the five years of professional education shall be spent in attendance at the University College of Medicine, Newcastle-upon-Tyne. Candidates who have passed the First and Second Examinations of the University will be exempt from First and Second Examinations of the Conjoint Board.

For the degree of *Bachelor of Surgery* every candidate must have passed the examination for the degree of Bachelor of Medicine of the University of Durham and must have attended one course of lectures on Operative Surgery and one course on Regional Anatomy. Candidates will be required to perform operations on the dead body and to give proof of practical knowledge of the use of surgical instruments and appliances.

For the degree of *Master of Surgery* candidates must not be less than 24 years of age and must satisfy the University as to their knowledge of Greek or German. In case they shall not have passed in one of these subjects at the Matriculation Examination for the M.B. degree they must present themselves at Durham for examination in it at one of the ordinary examinations held for this purpose before they can proceed to the higher degree of M.S. They must also have obtained the degree of Bachelor of Surgery of the University of Durham and must have been engaged for at least two years subsequently to the date of acquirement of the degree of Bachelor of Surgery, in attendance on the practice of a recognised hospital, or in the naval or military services, or in medical or surgical practice. The subjects of examination are:—Principles and Practice of Surgery, Surgical Pathology, Surgical Anatomy, Surgical Operations, Clinical Surgery.

For the degree of *Doctor of Medicine* candidates must be not less than 24 years of age and must satisfy the University as to their knowledge of Greek or German. In case they shall not have passed in one of these subjects at the Matriculation Examination for the M.B. degree they must present themselves at Durham for examination in it at one of the ordinary examinations held for this purpose before they can proceed to the higher degree of M.D. They must also have obtained the degree of Bachelor of Medicine of the University of Durham and must have been engaged for at least two years subsequently to the date of acquirement of the degree of Bachelor of Medicine in attendance on the practice of a recognised hospital, or in the military or naval services, or in medical and surgical practice. Each candidate must present an essay prepared entirely by himself, which must be typewritten, based on original research or observation, on some medical subject selected by himself, and approved of by the Professor of Medicine and must pass an examination thereon, and must be prepared to answer questions on the other subjects of his curriculum so far as they are related to the subject of the essay.

Doctor of Medicine (without residence).—The University of Durham has instituted a special examination whereby the degree of Doctor of Medicine may be obtained without residence. Candidates shall not be under 40 years of age and shall have been in active practice for 15 years as registered medical practitioners. They shall produce certificates of moral character from three registered members of the medical profession, and if they have not passed an examination in Arts previously to the Professional Examination in virtue of which they have been placed on the Register, they shall be required to pass in Classics and Mathematics. Candidates who have passed an examination in Arts previously to being placed on the Register are required to pass an examination in Latin. They will be examined in the Principles and Practice of Medicine, including Psychological Medicine, Hygiene, and Therapeutics, the Principles and Practice of Surgery, Midwifery, and Diseases of Women and Children, Pathology (Medical and Surgical), Anatomy (Medical and Surgical), Medical Jurisprudence, and Toxicology. The fee will be 50 guineas, of which 20 guineas will be retained if the candidate fails to satisfy the examiners.

Candidates for any of the above degrees must give at least 28 days' notice to Professor Howden, Secretary, College of Medicine, Newcastle-upon-Tyne. In the case of the M.D. (essay) examination candidates must send in their essays six weeks before the date of the examination.

Professors—Medicine: Sir G. H. Philipson, M.D., D.C.L. Surgery: F. Page, F.R.C.S. Physiology: T. Oliver, M.D. Anatomy: R. Howden, M.B. Midwifery: R. P. R Lyle. M.D. Comparative Pathology: H. J. Hutchens, M R C.S.

ARMSTRONG COLLEGE, NEWCASTLE.—Professors—Physics: H. Stroud, D.Sc. Chemistry: Phillips Bedson, D.Sc., and A. Meek, M.Sc. Botany: M. C. Potter, M.A.

THE VICTORIA UNIVERSITY OF MANCHESTER.

Matriculation, which consists in signing the University Register, must precede entry upon any course of study. Those only can matriculate who are registered students of the University.

Four degrees in Medicine and Surgery are conferred by the University—viz., Bachelor of Medicine and Bachelor of Surgery (M.B. and Ch.B.), Doctor of Medicine (M.D.), and Master of Surgery (Ch.M.).

All candidates for degrees in Medicine and Surgery are required to pass an examination called the Matriculation Examination (Faculty of Medicine), or to have passed such other examination as may be recognised by the University for this purpose.[3]

Degrees of Bachelor of Medicine and Bachelor of Surgery.—Before admission to the degree of M.B. or Ch.B. candidates are required to present certificates that they will have attained the age of 21 years on the day of graduation and that they have pursued the courses of study required by the University Regulations during a period of not less than five years subsequently to the date of their registration by the General Medical Council two of such years having been passed in the University and one year at least having been passed in the University subsequently to the date of passing the First M.B. Examination. All candidates for the degrees of Bachelor of Medicine and Bachelor of Surgery are required to satisfy the examiners in the several subjects of the following examinations: the First Examination, the Second Examination, the Third Examination, and the Final Examination.

---

[3] The Board will [illegible] exemption from the Matriculation Exam[illegible] [illegible] Medical Council have been [illegible] [illegible] plied to re[illegible] persons who hold Certificates of [illegible] [illegible] cations for exemption from [illegible] [illegible] The fee for registe[illegible] is £1.

The First Examination.—The subjects of examination are as follows:—(1) Chemistry; (2) Physics; (3) Biology. Candidates must have attended during at least one year courses both of lectures and of laboratory work in each of the above-named subjects. The Examination is divided into two parts: Part 1, Physics and Chemistry; Part 2, Biology; and the candidates may pass in these parts separately under certain conditions.

The Second Examination.—The subjects of examination are as follows:—(1) Anatomy; (2) Physiology, including Physiological Chemistry and Histology. Candidates may pass in (1) and (2) separately under certain conditions.

The Third Examination.—(1) Pathology; (2) Pharmacology and Therapeutics; (3) Hygiene. These subjects may be taken separately under certain conditions.

The Final Examination.—The subjects of examination are as follows:—(1) Medicine, Systematic and Clinical (including Mental Diseases and Diseases of Children); (2) Surgery, Systematic, Clinical, and Practical; (3) Midwifery and Gynæcology (including Practical Gynæcology); (4) Forensic Medicine (including Toxicology). These subjects may be taken separately under certain conditions.

Candidates for the Final Examination must have completed the fifth year of medical study.

Degree of Doctor of Medicine.—Candidates are not eligible for the degree of Doctor of Medicine unless they have previously received the degrees of Bachelor of Medicine and Bachelor of Surgery and at least one year has elapsed since they passed the examination for those degrees. Candidates may elect either (1) to present an original dissertation; or (2) to undergo an examination. The dissertation must embody the results of personal observation or original research, either in some department of medicine or of some science directly relative to medicine. The examination will consist of an examination in the Principles and Practice of Medicine, in Pathology, and in some other subject to be selected by the candidate. It will be partly written, partly practical.

Degree of Master of Surgery.—Candidates are not eligible for the degree of Master of Surgery unless they have previously received the degrees of Bachelor of Medicine and Bachelor of Surgery and at least one year has elapsed since they passed the examination for those degrees. The subjects of examination are as follows: (1) Surgical Anatomy; (2) Surgery; (3) Operative Surgery; (4) Clinical Surgery; (5) Ophthalmology; and (6) Pathology and Bacteriology.

Professors—Physics: E. Rutherford, D.Sc., F.R.S. Chemistry: H. B. Dixon, M.A., F.R.S. Organic Chemistry: W. H. Perkin, D.Sc., F.R.S. Zoology: S. J. Hickson, D.Sc., F.R.S. Botany: F. E. Weiss, D.Sc. Physiology: W. Stirling, D.Sc. Anatomy: A. H. Young, F.R.C.S. Materia Medica: R. B. Wild, M.D. Comparative Pathology and Bacteriology: A. S. Delépine, M.Sc. Pathology: J. Lorrain Smith, M.D. Clinical Medicine: Graham Steell, M.D. Systematic Medicine: George R Murray, M.A, M.D. Systematic Surgery: G. A. Wright, M B., F.R.C.S. Clinical Surgery: F. A. Southam, M B., F R.C.S. Obstetrics and Gynæcology: Sir W. J. Sinclair, M.D. Forensic Medicine: J. Dixon Mann, M.D.

Communications should be addressed to the Registrar, The University, Manchester.

UNIVERSITY OF BIRMINGHAM.

The University of Birmingham grants the degrees of M.B., Ch.B., M.D., Ch.M., and also a degree and a diploma in Public Health. The course for the Bachelors' degrees extends over five years from the date of registration with the General Medical Council. As a rule the first four of these years must be spent in the University, but the Senate has power of recognising attendance at another University as part of the attendance qualifying for these degrees and of recognising examinations passed at such other Universities as exempting from the examinations in Chemistry, Physics, and Elementary Biology. In the case of such students at least three years must be spent in attendance upon classes at the University. The fifth year may be spent at any other school or schools of medicine recognised by the University.

Degrees of Bachelor of Medicine and Bachelor of Surgery.—The student must have passed either the Matriculation Examination of the University or one of the following examinations. For the present the University will recognise any one of the following examinations, in lieu of its own Matriculation, in the case of medical students, provided always that such examination shall have included the subjects of English, Latin, Mathematics, and any one of the following: Greek, French, German, or any other modern foreign language, together with Chemistry or Experimental Mechanics, or some other branch of Experimental Physics, and that all the subjects have been passed at one examination: (*a*) the previous examination of the University of Cambridge; (*b*) responsions of the University of Oxford; (*c*) the Preliminary or Matriculation Examination of any recognised University; (*d*) the (Higher) Certificate of the Oxford and Cambridge Examinations Board; (*e*) the Oxford or Cambridge Senior Local Examination. A Matriculation Examination will be held on Sept. 14th, 1908, and succeeding days. First Examination.—Chemistry and Physics and Elementary Biology. Second Examination.—Anatomy and Physiology. Third Examination.—Pathology and Bacteriology, Materia Medica and Practical Pharmacy. Fourth Examination (at the end of the fourth year).—Forensic Medicine, Toxicology, and Public Health. Two years' hospital work must have been accomplished. Final Examination.—Medicine, Surgery, Midwifery, Gynæcology, Therapeutics, Mental Diseases, and Ophthalmology. Attendance at a general hospital for a year after the passing of the fourth examination will be required, also attendance at a fever hospital and lunatic asylum. Vaccination instruction must be taken out and courses of Ophthalmology, Medical and Surgical Anatomy, and Operative Surgery.

Degrees of Doctor of Medicine and Master of Surgery.—At the end of one year from the date of having passed the final M.B., Ch.B. examination the candidate will be eligible to present himself for the higher degrees of either Doctor of Medicine or Master of Surgery or both.

Candidates for either of these degrees will be required to comply with the following regulations. Every candidate for the degree of M.D. shall present a thesis embodying observations in some subject embraced in one of the departments of the medical curriculum enumerated below, and in addition he will be required to pass a general examination in Principles and Practice of Medicine. It will be in the power of the Board of Examiners to exempt a candidate whose thesis is of exceptional merit from any part of these examinations.

A thesis may be presented in any of the following departments of study: (*a*) Anatomy, including Comparative Anatomy, (*b*) Physiology, (*c*) Human or Comparative Pathology, (*d*) Bacteriology, (*e*) Pharmacology, (*f*) Therapeutics, (*g*) Medicine, (*h*) Mental Diseases, (*i*) Preventive Medicine or Public Health, (*j*) Toxicology, (*k*) Legal Medicine, (*l*) Midwifery.

Candidates for the degree of Ch.M. are required to comply with the following regulations:—At the end of one year from the date of having passed the final M.B., Ch.B. Examination candidates will be eligible to present themselves for the higher degree of Master of Surgery. Candidates for this degree will be required to comply with the following regulations: 1. Every candidate shall present a thesis, embodying observations in some subject embraced in one of the departments of the medical curriculum enumerated below; in addition the candidates will be required to pass a general examination in Principles and Practice of Surgery and to perform operations on the cadaver. 2. It will be in the power of the board of examiners to exempt a candidate whose thesis is of exceptional merit from any part of these examinations. 3. The candidate may be examined in that department of the medical curriculum from which the subject of his thesis is chosen and the examiners may require to see the notes of original observations on which the thesis is based, (*a*) Surgery, (*b*) Pathology, (*c*) Bacteriology, (*d*) Gynæcology, (*e*) Ophthalmology.

Degree in Public Health.—For the regulations for this degree and for the diploma in the same subject see p. 687.

Fees.—Matriculation, £2; First Examination, £2; Second Examination, £2; Third Examination, £2; Fourth Examination, £2; Final Examination, £2; Admission Fee to degrees of M.B., Ch.B., £6: M.D. or Ch.M., £2; Admission Fee to degree of M.D. or Ch.M., £8.

Professors—Physics: J. H. Poynting, Sc.D., F.R.S. Chemistry: P. H. Frankland, Ph.D., F.R.S. Elementary Biology: T. W. Bridge, Sc.D., F.R.S. Medicine: R.

Saundby, M.D., and A. H. Carter, M.D. Surgery: Bennet May, F.R.C.S., and G. Barling, F.R.C.S. Anatomy: A. Robinson, M.D. Physiology: E. W. Wace Carlier, M.D. Therapeutics: A. Foxwell, M.D. Forensic Medicine: J. T. J. Morrison, F.R.C.S. Hygiene and Public Health: A. Bostock Hill, M.D. Midwifery: E. Malins, M.D. Gynæcology: J. W. Taylor, F.R.C.S. Pathology: R. F. C. Leith, F.R.C.P. Edin. Lunacy and Mental Disease: E. B. Whitcombe, M.B. Operative Surgery: Jordan Lloyd, F.R.C.S. Ophthalmology: Priestley Smith, F.R.C.S.

UNIVERSITY OF LIVERPOOL.

The student must pass either (1) the University Matriculation Examination, or (2) the Final Examination for Graduation in Arts of any university in Great Britain and Ireland, or (3) the Matriculation Examination of the University of London, or (4) the Higher Certificate Examination of Oxford and Cambridge Joint Board, or (5) the Senior Local Examination of Oxford or Cambridge, with honours, or (6) some other examination of equal standard accepted by the Joint Matriculation Board. The course of professional study, subsequent to passing the Matriculation Examination and having been registered as a medical student, extends over five years. The degrees in the Faculty of Medicine are Bachelor of Medicine and Bachelor of Surgery (M.B. and Ch.B.), Doctor of Medicine (M.D.), and Master of Surgery (Ch.M.).

Degrees of Bachelor of Medicine and Bachelor of Surgery.—Candidates for the degrees of Bachelor of Medicine and of Surgery must have attained the age of 21 years on the day of graduation. At least two of the five years of medical study must have been passed in the University, and one year at least must have been passed in the University subsequently to the date of passing the First Examination. The other three years may be passed at any college or medical school recognised for this purpose by the University. Candidates must pass three examinations entitled respectively: the First Examination, the Second Examination, and the Final Examination. The fee is £5 for each examination. The subjects of the First Examination are: (1) Chemistry, Inorganic and Organic; (2) Biology (Zoology and Botany); and (3) Physics. The examination is divided into two parts—namely, (1) chemistry and physics, and (2) biology; and candidates may pass in these parts separately. The subjects of the Second Examination are (*a*) Anatomy and Physiology (including Physiological Chemistry and Histology), and (*b*) Materia Medica and Pharmacy. Candidates may pass in *a* or *b* separately. The subjects for the Final Examination are (1) Pharmacology and Therapeutics; (2) General Pathology and Morbid Anatomy; (3) Forensic Medicine and Toxicology, and Public Health; (4) Obstetrics and Diseases of Women; (5) Surgery, Systematic, Clinical, and Practical; and (6) Medicine, Systematic, and Clinical, including Mental Diseases and Diseases of Children. Candidates may either present themselves in all the six subjects of examination on the same occasion, or may pass the examination in two parts, the first part consisting of two or three of subjects (1), (2), and (3); the second part of the remaining subjects. Candidates for the first part of the examination must have completed the fourth winter of medical study in accordance with the regulations of the University.

Degrees of Doctor of Medicine and Master of Surgery.—No candidate will be admitted to the degrees of Doctor of Medicine or Master of Surgery unless he has previously received the Degrees of Bachelor of Medicine and Bachelor of Surgery, and at least one year has elapsed since he passed the examinations for those degrees. Candidates for the degree of Doctor of Medicine are required to present a dissertation embodying the results of personal observations or original research, either in some department of medicine or of some science directly relative to medicine: provided always that original work published in scientific journals or separately shall be admissible in lieu of, or in addition to, a dissertation specially written for the degree. No candidate shall be admitted to the degree unless his application after report from the Faculty of Medicine shall have been accepted by the Senate. Candidates may be required to undergo examination in any subject connected with the dissertation. The subjects of examination for the degree of Master of Surgery are (1) Surgical Anatomy, (2) Surgery, (3) Operative Surgery, (4) Clinical Surgery, (5) Ophthalmology, and (6) Pathology and Bacteriology.

Professors—Physiology: C. S. Sherrington, M.D., F.R.S. Physics: L. R. Wilberforce, M.A. Chemistry: J. Campbell Brown, D.Sc. Natural History: W. A. Herdman, D.Sc., F.R.S. Botany: R. J. H. Gibson, M.A. Anatomy: A. Melville Paterson, M.D. Medicine: T. Robinson Glynn, M.D. Surgery: Rushton Parker, F.R.C.S. Pathology: Sir Rubert Boyce, M.B., F.R.S. Midwifery and Gynæcology: H. Briggs, M.D. Therapeutics: J. H. Abram, M.D. Hygiene: E. W. Hope, D.Sc. Tropical Medicine: Major Ronald Ross, C.B., F.R.S. Bio-Chemistry: B. Moore, D.Sc. Comparative Pathology: H. E. Annett, M.D.

UNIVERSITY OF LEEDS.

Candidates presenting themselves for Matriculation in the Faculty of Medicine must pass an examination in English (Language or Literature) and English History, Mathematics and Latin, and in two of eight optional subjects. Exemption from the matriculation examination is granted to graduates of any university of the United Kingdom provided Latin has formed part of one of the degree examinations.

Four degrees in Medicine and Surgery are conferred—viz.: Bachelor of Medicine and Bachelor of Surgery (M.B. and Ch.B.), Doctor of Medicine (M.D.), Master of Surgery (Ch.M.), also Degrees and Diplomas in Dental Surgery and a Diploma in Public Health.

Degrees of Bachelor of Medicine and Bachelor of Surgery.—Candidates for the degrees of Bachelor of Medicine and of Surgery are required to present certificates showing that they will have attained the age of 21 years on the day of graduation, and that they have attended courses of instruction approved by the University extending over not less than five years, two of such years, at least, having been passed in the University subsequently to the date of passing the First Examination. Candidates must also satisfy the examiners in the several subjects of the following examinations entitled respectively: the Matriculation Examination, or such other examination as may have been recognised by the Joint Matriculation Board in its stead; the First Examination; the Second Examination; and the Final Examination.

The First Examination.—The First Examination consists of: Part I., Physics and Chemistry; Part II., Biology. Candidates will be allowed to pass the two parts separately.

The Second Examination.—The Second Examination consists of: Part I., Anatomy and Physiology; Part II., Materia Medica and Pharmacy. Candidates will be allowed to pass the two parts separately.

The Final Examination.—The Final Examination consists of: Part I., Pathology and Bacteriology, Forensic Medicine, and Public Health. Part II., Medicine: Systematic and Clinical, including Mental Diseases and Diseases of Children; Surgery: Systematic, Clinical and Practical; Obstetrics and Gynæcology, Systematic, Clinical, and Practical; Pharmacology and Therapeutics. Candidates will be allowed to pass the two parts separately and they may present themselves for examination in Part I. at the end of the tenth term.

Degree of Doctor of Medicine.—Candidates are not eligible for the degree of Doctor of Medicine unless they have previously received the degrees of Bachelor of Medicine and Bachelor of Surgery and at least one year has elapsed since they passed the examination for those degrees. Candidates for the degree of Doctor of Medicine are required to present a dissertation and, if the dissertation be accepted, to pass an examination. The dissertation, of which the subject must previously have received the approval of the Board of the Faculty of Medicine, must embody the results of personal observations or original research, either in some department of medicine or of some science directly related to medicine; provided always that original work published in scientific journals or in the Proceedings of learned societies, or separately, shall be admissible in lieu of, or in addition to, a dissertation specially written for the degree. Candidates will be required to write a short extempore essay on some topic connected with medicine and to answer questions on the history of medicine. They will also be examined orally on the dissertation or other work submitted. Any candidate may be exempted from a part or the whole of the examination if the Board of the Faculty so decide. No candidate will be admitted to the degree unless his application, after report from the Board of the Faculty of Medicine, shall have been accepted by the Senate.

Degree of Master of Surgery.—Candidates are not eligible for the degree of Master of Surgery unless they have previously received the degrees of Bachelor of Medicine and

Bachelor of Surgery and at least one year has elapsed since they passed the examination for those degrees. Every candidate is also required to furnish certificates of attendance in accordance with the regulations of the University. The subjects of examination are as follows: Surgical Anatomy, Surgery, Operative Surgery, Clinical Surgery, Ophthalmology, Pathology, and Bacteriology.

Diploma in Public Health.—The regulations for this diploma will be found on p. 637.

Professors—Physics: W. Stroud, D.Sc. Chemistry: A. Smithells, B.Sc., F.R.S. Organic Chemistry: J. B. Cohen, B.Sc Zoology: W. Garstang, M.A. Botany: V. F. Blackman, M.A. Anatomy: T. Wardrop Griffith, M.D. Physiology and Histology: De Burgh Birch, M.D. Pathology: A. S. Grünbaum, M.D. Medicine: A. G. Barrs, M.D. Surgery: H. Littlewood, M.So., F.R.G.S. Obstetrics: J. B. Hellier, M.D. Public Health: J. S. Cameron, M.D. Therapeutics: H. J. Campbell, M.D.

UNIVERSITY OF SHEFFIELD.

Candidates for a medical degree shall have matriculated in the University or have passed such other examination as may be recognised for this purpose by the University and sanctioned by the Joint Matriculation Board. The subjects required by the General Medical Council must be included in the Matriculation Examination or its recognised substitute.

The Degrees in the Faculty of Medicine are Bachelor of Medicine and Bachelor of Surgery (M.B., Ch.B.), Doctor of Medicine (M.D.), and Master of Surgery (Ch.M.).

Degrees of Bachelor of Medicine and Bachelor of Surgery.—A candidate for the degrees of M.B., Ch.B., shall produce certificates that he will have attained the age of 21 years on the day of graduation; that he has pursued the courses of study required by the University regulations during a period of not less than five years subsequently to the date of his registration as a medical student by the General Medical Council, three of such years at least having been passed in the University and one year at least having been passed in the University subsequently *to the date* of passing the First Examination.

The First Examination.—The subjects of examination are chemistry, physics, and biology. The examination is divided into two parts, A (chemistry and physics) and B (biology), and candidates may pass in each part separately. The Intermediate B.Sc. Examination in these subjects will, on payment of the required additional fee, be accepted instead of this examination. Candidates must, after matriculation and registration as a medical student, have attended courses of instruction (lectures and laboratory work) in chemistry, physics, and biology, for one year each.

A Special Examination in Organic Chemistry.—This is held at the end of the first term in the *second* year of study, after completion of the First Examination.

The Second Examination.—The subjects of examination are anatomy, physiology, materia medica, and pharmacy. The examination is divided into two parts, A (anatomy and physiology) and B (materia medica and pharmacy), and candidates may pass in either part separately. Candidates must have completed the third winter session of professional study, must have passed the first examination, and must have attended (1) lectures on anatomy and dissections during two winter sessions and one summer session; (2) lectures on physiology during two winter sessions, practical physiology during two winter sessions, and histology during one summer session; and (3) materia medica and pharmacy for three months.

The Third or Final Examination.—The subjects of examination are divided into two parts—namely, A (forensic medicine and toxicology, public health, and pathology and morbid anatomy) and B (medicine, including pharmacology and therapeutics, mental diseases, and diseases of children, surgery, obstetrics, and gynæcology). Candidates may present themselves for examination in both parts on the same occasion or separately, but Part A may not be passed before the completion of the fourth year of study. Candidates for the whole examination or for Part B must have completed the fifth year of study.

Degree of Doctor of Medicine.—Candidates for the degree of Doctor of Medicine must have passed the examination for the degrees of M.B., Ch.B. at least one year previously, must present a thesis embodying observations in some subject approved by the professor of medicine, and must pass an examination in the Principles and Practice of Medicine.

Degree of Master of Surgery.—Candidates for the degree of Ch.M. must have passed the examination for the degrees of M.B., Ch.B. *at least one year previously* and must, since taking the degrees of M.B., Ch.B., have held for not less than six months a surgical appointment in a public hospital or other public institution, affording full opportunity for the study of Practical Surgery.

The subjects of examination are Systematic, Clinical, and Operative Surgery, Surgical Anatomy, Surgical Pathology, and Bacteriology.

Professors—Physics: W. M. Hicks, Sc.D., F.R.S. Chemistry: W. Palmer Wynne, D.Sc., F.R.S. Biology: Alfred Denny, M.Sc., F.L.S. Anatomy: C. J. Patten, M.A., M.D., D.Sc. Physiology: J. S. Macdonald, B.A., L.R.C.S., L.R.C.P. Medicine: D. Burgess, M.A., M.B., F.R.C.P. Materia Medica, &c.: W. T. Cocking, M.D. Surgery: R. J. Pye-Smith, Ch.M., F.R.C.S. *Pathology*: J. M. Beattie, M.A., M.D. Midwifery: R. Favell, Ch.M., M.R.C.S. Ophthalmology: Simeon Snell, D.Sc., F.R.C.S. Edin. Public Health: Ralph P. Williams, M.D., B.S., D.P.H.

UNIVERSITY OF EDINBURGH.

Four Degrees in Medicine and Surgery are conferred by the University of Edinburgh—viz., Bachelor of Medicine (M.B.), Bachelor of Surgery (Ch.B.), Doctor of Medicine (M.D.), and Master of Surgery (Ch.M.). The degree of Bachelor of Surgery cannot be conferred on any person who does not at the same time obtain the degree of Bachelor of Medicine, and similarly the degree of Bachelor of Medicine is not conferred on any person who does not at the same time obtain the degree of Bachelor of Surgery.

A diploma in Tropical Medicine and Hygiene (D.T.M. and H.) is granted to graduates in Medicine and Surgery of the University of not less than six months' standing. The course of study includes (1) Practical Bacteriology; (2) Diseases of Tropical Climates; (3) Tropical Hygiene; (4) a Practical Course in Medical Entomology and Protozoology and Venomous Animals; and (5) a Course of Clinical Instruction in Tropical Diseases. Any two of these courses may be taken under Extra-academical Teachers and exemption from the latter course may be granted to those graduates who have been engaged for a period of at least 12 months in the treatment of Tropical Diseases in any tropical or subtropical country. The examinations for the diploma, which will embrace all the foregoing subjects, are held in January and July of each year.

Before commencing his medical studies each student must pass a preliminary examination in (1) English, (2) Latin, (3) Elementary Mathematics, and (4) Greek or French or German: provided always that, in the case of a candidate whose native language is not English, an examination in the native language of the candidate may be substituted for one in either French or German, and an examination in any other classical language for one in Latin or Greek.

No one is admitted to the degrees of *Bachelor of Medicine* and *Bachelor of Surgery* who has not been engaged in Medical and Surgical study for five years. *No course* of lectures will be allowed to qualify unless the lecturer certifies that it has embraced at least 100 lectures, or 50 lectures, as may be required by the regulations, and that the student has also duly performed the work of the class.

Candidates for the degrees of M.B. and Ch.B. must have attended for at least three academic years the medical and surgical practice either of the Royal Infirmary, Edinburgh, *or* of a general hospital elsewhere which accommodates not fewer than 80 patients and possesses a distinct staff of physicians and surgeons. They must have attended Clinical Surgery during a course or courses extending over not less than nine months. These courses may be conducted by the professor of clinical surgery, or by professors or lecturers appointed for the purpose by the University Court, or by the ordinary surgeons of the Royal Infirmary, Edinburgh, or of a general hospital defined and recognised as hereinbefore provided, and shall consist of regular instruction at the bedside, along with clinical lectures. A similar course of clinical medicine during a course or courses extending over not less than nine months is required. The candidate must have attended a course of instruction in Mental Diseases given by the University Lecturer, or by a recognised Teacher, consisting of not less than six Class-room meetings for lectures and demonstrations and ten meetings in the Wards of a recognised Asylum for the insane. The candidate must have attended a coarse of 25 meetings on Practical Pharmacy in a university or recognised school of medicine, or have dispensed drugs for a period of three months in a hospital or dispensary, or in an establishment recognised by the Pharmaceutical Society. The candidate must have attended for at least six months, by apprenticeship or otherwise, the out-practice of a hospital, or the practice of a dispensary, or of a physician or surgeon, or of a member of the London or Dublin Society of Apothecaries. He must have acted as clerk in the medical wards and dresser in the surgical wards of a public hospital for a period of six months in each case; and must also have availed himself, to such an extent as may be required by the Senatus, with the approval of the University Court, of opportunities of studying at a hospital or dispensary, Post-mortem Examinations, Fevers, Diseases of the Eye, Operative Surgery, and one of the three following—viz.: Diseases of Children; Diseases of the Larynx, Ear, and Nose; and Diseases of the Skin, or such other special departments as may from time to time be determined. The candidate must have attended, under the superintendence of a registered medical practitioner, 25 cases of labour, or such additional number as the Senatus, with the sanction of the University Court, may from time to time determine; or have attended for three months the practice of a lying-in hospital, or of the maternity department of a general hospital or other public charitable institution and have conducted personally 12 or such an additional number of cases of labour as the Senatus, with the approval of the University Court, may from time to time determine. The candidate must have been properly instructed in Vaccination at a public vaccination station, by a public vaccinator, authorised by the proper Government authority to grant certificates of proficiency in vaccination.

With respect to the places and institutions at which the studies of the candidate may be prosecuted the following regulations have effect:—Two of the five years of medical study must be spent in the University of Edinburgh. The remaining three years may be spent in any University of the United Kingdom, or in any Indian, Colonial, or Foreign university recognised for the purpose by the University Court, or in such medical schools or under such teachers as may be recognised for the purpose by the University Court. Of the subjects of study, 16 in number—viz., Anatomy, Practical Anatomy, Chemistry, Practical Chemistry, Materia Medica, Physiology, Practical Physiology, Practice of Medicine, Surgery, Midwifery and Diseases of Women, Pathology, Practical Pathology, Physics, Botany, Zoology, Medical Jurisprudence, and Public Health—not less than eight must be taken in the University of Edinburgh or in some other university of the United Kingdom, or in some Foreign or Colonial university entitled to confer the degree of Doctor of Medicine, recognised for the purpose by the University Court, or, in a college incorporated with, or affiliated to, a university entitled to confer the degree of Doctor of Medicine, recognised for the purpose by the University Court.

Women are admitted to graduation in medicine under practically the same conditions as men, excepting that, until provision is made in the University for instruction of women in all subjects of the medical curriculum, the regulations as to places of study contained in the foregoing paragraph do not apply to them. The Medical College for Women, 30, Chambers-street, Edinburgh, has been recognised as a medical school whose courses of instruction qualify for graduation.

Each candidate is examined, both in writing and orally, and clinically where the nature of the subject admits:—First, in Chemistry, Zoology, Botany, and Physics; second, in Anatomy and Physiology; third, in Materia Medica and Therapeutics and Pathology; and fourth, in Surgery, Medicine, Midwifery, Forensic Medicine, and Public Health, and clinically in Medicine, Surgery, and Gynæcology in a hospital. The examinations are conducted, as far as possible, by demonstrations of objects placed before the candidates. Candidates who profess themselves ready to submit to an examination in the first division of these subjects may be admitted to examination therein at the first period of examination after they have completed their attendance on the necessary classes. Candidates who have passed their examination in the first division of these subjects may be admitted to examination in the second division at the end of their third winter session. Candidates who have passed their examinations in the subjects comprised in the first and second divisions may be admitted to examination in the thir division at the end of the fourth winter session. Candidate who have passed their examinations in the subjects com prised in the first, second, and third divisions may b admitted to examination in the fourth or final division whe they have completed the fifth year of study.

Under a new medical ordinance it is provided that cand dates may pass all or any of the subjects of the first divisio —viz., Botany, Zoology, Physics, or Chemistry—at a un versity in the United Kingdom or at any other universit approved by the Senate for this purpose, when such subjec qualify for a degree in arts or science. In the secon division the examination in Physiology may be taken at a time and in Anatomy at any time after the first half sessi of the third winter session. In the third division the ex mination in Pathology may be taken at any time after t end of the third summer session in the case of students w begin the medical curriculum in October and at the end the fourth summer session in the case of students w begin their medical curriculum in May. In Materia Medi the examination may be taken at any time after the end the fourth winter session. Candidates may be admitted examination in Practical Pharmacy and in the physica chemical, and botanical characters of medicinal substanc at any examination held after they have completed t qualifying course of study. In the fourth division a stude after taking the prescribed courses of study may be ex mined in Forensic Medicine and Public Health at any tim in Midwifery at any time after the end of the first ha session, of the fifth winter session, in the Practice of Medici and Surgery at any time after the end of the fifth win session, and in Clinical Medicine (including the subject Diseases Peculiar to Women) and Clinical Surgery at t end of the fifth year of study. These new ordinances apply students who entered the University at or after the beginni of the winter session 1907, but students who ente before that date have the option of finishing their cou under the existing regulations or of taking advantage of t new ordinances.

The fee to be paid for the degrees of Bachelor of Medici and Bachelor of Surgery is £23 2*s.*, and the proportion this sum to be paid by a candidate at each division the examination shall be as follows—viz.: For the Fi Division of the Examination (Botany, Zoology, Physi and Chemistry), £6 6*s.*; for the Second Division (Anaton and Physiology), £5 5*s.*; for the Third Division (Patholc and Materia Medica and Therapeutics), £4 4*s.*; and for t Final Division (Surgery and Clinical Surgery, Medicine a Clinical Medicine, Midwifery, Clinical Gynæcology, a Forensic Medicine and Public Health), £7 7*s.*

Bachelors of Medicine and *Bachelors of Surgery* m proceed to the degrees of *Doctor of Medicine* and *Mas of Surgery* after they have spent one year in the medi or surgical wards respectively of a hospital, or the Milit or Naval Medical Services, or in scientific work bear directly on their profession, or two years in practice. each case an examination must be passed and a the submitted for approval of the Faculty. The fee to be p for the degree of M.D. is £10 10*s.*, and the fee to be p for the degree of Ch.M. is £10 10*s.*

Professors—Natural Philosophy: J. G. Macgregor, D. Materia Medica: Sir Thomas R. Fraser, M.D., F.R Forensic Medicine: H. Harvey Littlejohn, M.B., F.R.C.S Chemistry: James Walker, D.Sc., F.R.S. Surgery: J Chiene, C.B., M.D. Medicine: J. Wyllie, M.D. Anaton D. J. Cunningham, M.D. Pathology: William Smith Gre field, M.D. Midwifery: Sir John Halliday Croom, M Clinical Medicine: Sir T. R. Fraser, W. S. Greenfield, and Wyllie. Clinical Surgery: F. M. Caird, M.B., F.R.C Botany: I. Bayley Balfour, M.D. Physiology: E. A. Schäf F.R.S. Zoology: J. Cossar Ewart, M.D. Public Health, & C. Hunter Stewart, M.B., D.Sc.

UNIVERSITY OF GLASGOW.

The University of Glasgow is both a teaching and degree-granting body, but admits to graduation o candidates whose preliminary examination and cou of study conform to its own regulations. Wit certain limits instruction given by recognised medi schools and teachers may be accepted, but ei of the subjects other than clinical must be ta in this or some other recognised university entit to confer the degree of M.D., and at least two years of course must be taken in Glasgow University. Under new regulations six degrees, open both to men and women, are conferred: M.B. and Ch.B. (always conjointly), M.D. and Ch.M.; B.Sc. in Public Health; D.Sc. in Public Health; and B.Sc. in Pharmacy. A Preliminary Examination must be passed in (1) English, (2) Latin, (3) Elementary Mathematics, and (4) Greek, or French, or German, with possible options to students whose native language is not English in the case of the fourth subject. Candidates taking the University preliminary examination are not obliged to pass in all the four subjects at one examination but must do so at not more than two occasions.

For the degrees of M.B. and Ch.B. a curriculum of five years required, in each of the first four of which the student must attend at least two five months' courses, or alternately one five months' course and two courses of two and a half months. The minimum of attendance in the first four years includes five months' courses in the following subjects:—Anatomy, Practical Anatomy (two courses), Chemistry, Materia Medica and Therapeutics, Physiology, Practice of Medicine, Surgery, Midwifery and Diseases of Women and Infants, and Pathology; and courses of two and a half months in the following: Practical Chemistry, Physics, Botany, Zoology, Practical Physiology, Practical Pathology, Medical Jurisprudence, and Public Health. Candidates must attend at least three years the Medical and Surgical Practice of a recognised hospital accommodating at least 80 patients and having a distinct staff of physicians and surgeons. At least nine months' hospital attendance is required on both Clinical Surgery and Clinical Medicine, and the student must have acted as clerk in medical and dresser in surgical wards, and must have had six months' outdoor practice; he must also have attended a course of Mental Diseases and of Practical Pharmacy (25 meetings), must have been properly instructed in Vaccination at a public vaccination station, and must have attended at least 12 cases of labour, or three months of the Practice of a Lying-in Hospital, six cases being personally conducted. The University also requires further study in Post-Mortem Examinations, Fevers, and Ophthalmology, and recommends study in other special subjects. If a candidate has completed in a University of the United Kingdom a course of study and passed an examination in Botany, Zoology, Physics, or Chemistry, qualifying for a degree in Science or in Arts, he is held to have passed the examinations in such subject or subjects.

There are four Professional Examinations, the first comprising Botany, Zoology, Physics, and Chemistry, to be taken after the completion of the included courses (candidates being at liberty to take two subjects at a time); the second comprising Anatomy, Physiology, and Materia Medica and Therapeutics, to be taken at the end of the third winter session; the third comprising Pathology, Medical Jurisprudence, and Public Health, to be taken at the end of the fourth winter session; and the fourth or final, comprising Surgery, Clinical Surgery, Practice of Medicine, Clinical Medicine, and Midwifery, to be taken on completion of the fifth year of study.

The degrees of M.D. (Doctor of Medicine) and Ch.M. (Master of Surgery) are higher degrees in Medicine and Surgery respectively, and candidates (not under 24 years of age) who have previously obtained the double bachelorship may be admitted to either M.D. or Ch.M. on completing the after course prescribed, including an examination in Clinical Medicine for M.D. and an examination in Surgical Anatomy, operations on the dead body, and Clinical Surgery for Ch.M.

Fees.—The Fees for M.B. and Ch.B. are £23 2*s.* The class fee in each subject of the curriculum for M.B. and Ch.B. is £2 2*s.*, £3 3*s.*, or £4 4*s.*, and the present fees for hospital attendance are £10 10*s.* The fee for M.D. is £10 10*s.* (stamp duty being now abolished), and for Ch.M. £10 10*s.*

The great majority of the students take their hospital course at the Western Infirmary, where clinical instruction is given by professors of the University and others. Clinical instruction on Fevers is given at Ruchil and Belvidere Hospitals, while special courses, largely of a practical nature and embracing work in Hospital or Asylum wards, are conducted by University Lecturers on the Ear, the Throat and Nose, and Insanity. Queen Margaret College, hitherto conducted as a separate institution for the higher education of women, has now been made over to the University and its medical classes for women are conducted under University professors and other lecturers appointed by the University Court, whilst for clinical instruction female students are admitted to the Royal Infirmary.

Bursaries and Prizes to the annual amount of over £1000 are appropriated to medical students, and Scholarships and Fellowships to the annual amount of about £1600 may be held by medical students who have gone through the Arts course.

Professors—Natural Philosophy: A. Gray, LL.D., F.R.S. Materia Medica: Ralph Stockman, M.D. Chemistry: John Fergusson, LL.D. Surgery: Sir William Macewen, M.D., F.R.S. Practice of Medicine: Sir Thomas McCall Anderson, M.D. Midwifery: Murdoch Cameron, M.D. Anatomy: John Cleland, M.D., F.R.S. Zoology: John G. Kerr, M.A. Botany: F. O. Bower, D.Sc., F.R.S. Physiology: D. Noel Paton, M.D. Forensic Medicine: John Glaister, M.D. Clinical Surgery: Sir H. C. Cameron, M.D. Clinical Medicine: S. Gemmell, M.D. Pathology: Robert Muir, M.A., M.D.

UNIVERSITY OF ABERDEEN.

The University of Aberdeen grants four degrees in Medicine and Surgery—viz., Doctor of Medicine (M.D.), Master of Surgery (Ch.M.), Bachelor of Medicine (M.B.), and Bachelor of Surgery (Ch.B.). The two degrees of M.B. and Ch.B. are not conferred separately and the higher degrees of M.D. and Ch.M. are only granted to holders of the M.B. and Ch.B. degrees.

Degrees of M.B. and Ch.B.—Before commencing his medical studies each student must pass a Preliminary Examination in (1) English, (2) Latin, (3) Mathematics, and (4) Greek, or French, or German. In the case of a candidate whose native language is not English an examination in the candidate's native language may be substituted for one in French or German, and an examination in any other classical language for one in Latin or Greek. The curriculum for the degrees extend over a period of five years, during which attendance is required in the following subjects: Botany, Zoology, Physics, Chemistry (Systematic and Practical), Anatomy (Systematic and Practical), Physiology (Systematic and Practical), Materia Medica and Therapeutics, Practical Pharmacy, Pathology (Systematic and Practical), Medical Jurisprudence and Public Health, Surgery, Medicine, and Midwifery.

Candidates must attend for at least three years the medical and surgical practice of a recognised hospital accommodating at least 80 patients and having a distinct staff of physicians and surgeons, and they must have attended courses of at least nine months in clinical medicine and clinical surgery. The candidate must have acted as clerk in the medical and dresser in the surgical wards of a hospital and must have attended for at least six months the practice of a dispensary or the out-practice of a hospital, &c. Attendance is also required on courses in Mental Diseases, Fevers, Ophthalmology, Post-mortem Examinations, and other special subjects. The candidate is also required to have been properly instructed in Vaccination and to have attended at least 12 Midwifery cases.

Professional Examinations are held twice in each year—namely, in March and July, directly after the close of the winter and summer sessions.

The fee for the degrees of M.B. and Ch.B. amounts to £23 2*s.* Matriculation fee for the winter and summer sessions, £1 1*s.*; summer session alone, 10*s.* 6*d.*

Besides the Royal Infirmary, students have the opportunity of attending the following institutions: City Fever Hospital, Sick Children's Hospital, General Dispensary, and Lying-in and Vaccine Institutions (daily), Royal Lunatic Asylum, Ophthalmic Institution, &c.

Degrees of M.D. and Ch.M.—Candidates for either of these degrees must already hold the degrees of M.B. and Ch.B. of Aberdeen. A thesis has to be presented for approval by the Medical Faculty and an examination has to be passed in Clinical Medicine or Clinical Surgery as the case may be. Fee for each of the degrees £10 10*s.*

A diploma in Public Health is granted by the University to graduates in Medicine of a University in the United Kingdom, after a special examination. The diploma can be entered on the Register of the General Medical Council.

Application for further information should be addressed to the Secretary of the Medical Faculty.

Professors—Natural Philosophy: C. Niven, M.A., F.R.S. Physiology: J. A. MacWilliam, M.D. Medicine: David

White Finlay, M.D. Chemistry: F. R. Japp, LL.D., F.R.S. Anatomy: R. W. Reid, M.D., F.R.C.S. Surgery: A. Ogston, C.M. Materia Medica: J. T. Cash, M.D., F.R.S. Midwifery: W. Stevenson, M.D. Forensic Medicine: Matthew Hay, M.D. Botany: J. W. H. Trail, M.D., F.R.S. Pathology: D. J. Hamilton, M.B., LL.D. Natural History: J. Arthur Thomson, M.A.

UNIVERSITY OF ST. ANDREWS (UNITED COLLEGE, ST. ANDREWS AND UNIVERSITY COLLEGE, DUNDEE).

The following are extracts from the Regulations for Degrees in Medicine contained in Ordinance No. 45 (St. Andrews, No 4) of the Commissioners under the Universities (Scotland) Act, 1889. These regulations came into force on April 19th, 1897. Four degrees in Medicine and Surgery shall be conferred by the University of St. Andrews—viz., Bachelor of Medicine (M.B.), Bachelor of Surgery (Ch.B.), Doctor of Medicine (M.D.), and Master of Surgery (Ch.M.). The degrees of M.B. and Ch.B. shall always be conjoined. Before commencing his medical studies each student shall pass a Preliminary Examination in (*a*) English, (*b*) Latin, (*c*) Elementary Mathematics, and (*d*) one of the following optional subjects:—(α) Greek, (β) French, (γ) German, (δ) Italian, (ε) any other Modern Language, (ζ) Logic. A degree in Arts or in Science in any of the Universities of the United Kingdom and in some colonial or foreign universities shall exempt from the Preliminary Examination. The Preliminary Examination for graduation in Medicine and Surgery, Arts or Science, of the University of St. Andrews is accepted as equivalent to the Registration Examination required by the General Medical Council (the certificate to include the required subjects). Also the Final Examination for a degree in Arts or Science and the Final Examination for the Diploma of L.L.A.

Degree of Bachelor of Medicine and Bachelor of Surgery.—Candidates must have been engaged in medical study for at least five years. In each of the first four years the candidate must have attended at least two courses of instruction in one or more of the subjects of study specified below, each course extending over a session of not less than five months, either continuous or divided into two terms, or, alternatively, one such course along with two courses, each extending over a session of not less than two and a half months. During the fifth or final year the candidate shall be engaged in clinical study for at least nine months at the Infirmary of Dundee or at one or more of such public hospitals or dispensaries, British or foreign, as may be recognised for the purpose by the University Court. The candidate must have received instruction in each of the following subjects of study, including such examinations as may be prescribed in the various classes—viz.: Anatomy, Practical Anatomy, Chemistry, Materia Medica, Physiology, or Institutes of Medicine, Practice of Medicine, Surgery, Midwifery and the Diseases peculiar to Women and Infants, Pathology, Practical Chemistry, Physics (including the Dynamics of Solids, Liquids, and Gases, and the Rudiments of Sound, Heat, Light, and Electricity), Elementary Botany, Elementary Zoology, Practical Physiology, Practical Pathology, Forensic Medicine, and Public Health. The candidate must have attended for at least three years the Medical and Surgical Practice either of the Infirmary of Dundee or of a General Hospital elsewhere which accommodates not fewer than 80 patients and possesses a distinct staff of physicians and surgeons and is recognised for the purpose by the University Court. Additional subjects of study are Practical Pharmacy, Mental Diseases, Practical Midwifery Vaccination, Children's Diseases, Fevers, Ophthalmology, and Post-mortem Examinations.

With respect to the places and institutions at which the studies of the candidate may be prosecuted the following regulations shall have effect:—1. Two of the five years of medical study must be spent in the University of St. Andrews. 2. The remaining three years may be spent in any University of the United Kingdom or in any Indian, Colonial, or Foreign University recognised for the purpose by the University Court, or in such medical schools or under such teachers as may be recognised for the purpose by the University Court.

Women shall be admitted to graduation in Medicine, subject to the provisions of Ordinance No. 18 [General No. 9—Regulations for the Graduation of Women and for their Instruction in the Universities]: Provided always that every candidate for graduation shall produce evidence of having satisfied the conditions herein laid down with respect to the Preliminary Examination, and shall be examined in all the subjects necessary for graduation by the Examiners of the University of St. Andrews. All the classes necessary for graduation shall be taken in the University of St. Andrews, except in so far as instruction obtained elsewhere is allowed by the said Ordinance.

Professional Examinations for the Degrees of Bachelor of Medicine and Bachelor of Surgery.—Each candidate shall be examined both in writing and orally, and also clinically where the nature of the subject admits, in the following divisions—viz., first, in Botany, Zoology, Physics, and Chemistry; second, in Anatomy, Physiology, and Materia Medica; third, in Pathology, and Forensic Medicine and Public Health; and fourth, in Surgery and Clinical Surgery, Practice of Medicine and Clinical Medicine, and Midwifery and Gynæcology.

The fee to be paid for the degrees of Bachelor of Medicine and Bachelor of Surgery shall be 22 guineas and the proportion of this sum to be paid by a candidate at each division of the examination shall be regulated from time to time by the University Court. The fee to be paid for the degree of Doctor of Medicine shall be 10 guineas, exclusive of any stamp duty which for the time may be demanded. The fee to be paid for the degree of Master of Surgery shall be 10 guineas.

The whole medical curriculum can be taken in University College or the first two years in United College.

Bursaries, United College, St. Andrews.—Fourteen Taylour Thomson Bursaries for female Medical students of the annual value of from £20 to £30 each, tenable for one or two years. The Bursaries are awarded in the order of merit, the most valuable ones being given to those students who obtain the highest marks in the Preliminary Examination and who are prepared to take two Anni Medici at the United College, St. Andrews.

University College, Dundee.—(*a*) Open to either sex Eleven Entrance Bursaries of £15, tenable for one year. (*b*) Open to either sex: Four £20 and three £15, second year. (*c*) Four £20 and two £15, third year. (*d*) Two £20, fourth year. (*e*) Two £20, fifth year. (*f*) Bute Bursary, founded in 1893 by the late Most Honourable the Marquis of Bute, K.T. This Bursary consists of the free proceeds of £1000. (*g*) Two Bursaries of the annual value of £25, tenable for three years at either University College, Dundee, or at any Scottish University (local candidates only).

Professors—Natural Philosophy: William Peddie, D.Sc., F.R.S.E. Chemistry: (vacant). Natural History (Boyd Baxter's): D'Arcy W. Thompson, M.A., C.B. Botany (White's): Patrick Geddes, F.R.S.E. Anatomy (Cox's): J. Yule Mackay, M.D., LL.D. Physiology: E. W. Reid, B.A., D.Sc., M.B., M.R.C.S., F.R.S. Pathology: L. R. Sutherland, M.B., C.M. Surgery: D. MacEwan, M.D. Medicine: Alexander M. Stalker, M.A., M.D. Midwifery: J. A. C. Kynoch, M.B., F.R.C.P.Edin. Materia Medica: C. R. Marshall, M.A., M.D.

United College of St. Salvator and St. Leonard.—Professors—Natural Philosophy: A. S. Butler, M.A. Natural History: W. C. McIntosh, M.D., LL.D., F.R.S. Chemistry: Thomas Purdie, B.Sc., Ph.D., LL.D., F.R.S. Anatomy: James Musgrove, M.D., C.M. Physiology: (vacant).

For further particulars apply to the Dean of the Medical Faculty, University College, Dundee.

UNIVERSITY OF DUBLIN (TRINITY COLLEGE).

Matriculation.—All students in the School of Physic intending to practise Physic must pass a matriculation examination. This may be either the Public Entrance of Trinity College and a Junior Freshman Term or a special Medical Preliminary, or, for Extern Students, an examination recognised by the General Medical Council. No student can be admitted for the winter course after Nov. 25th.

Degrees in Medicine (M.B.), Surgery (B.Ch.), and Midwifery (B.A.O.).—Candidates for these degrees must be of B.A. standing and must be for at least five academic years on the books of the Medical School, reckoned from the date of matriculation. The Arts course may be concurrent with the medical course and the B.A. degree need not be taken before the final medical examinations, but the medical degrees are not conferred without the Arts degree. The following courses must be attended:—(1)

Lectures—Systematic, Descriptive and Applied Anatomy, Chemistry and Practical Chemistry, Surgery and Operative Surgery, Histology, Botany, Zoology, Physics, Physiology and Practical Physiology, Practice of Medicine, Midwifery, Pathology, Materia Medica and Therapeutics, Medical Jurisprudence and Hygiene; (2) three courses of nine months' attendance on the Clinical Lectures of Sir Patrick Dun's or other recognised Dublin Hospital (two years at a recognised London or Edinburgh hospital before the commencement of the Dublin curriculum may be counted as one year spent in such Dublin hospital); (3) Practical Vaccination, one month's instruction; (4) Mental Disease, three months; (5) Practical Midwifery with Clinical Lectures, including not less than 30 cases, six months; (6) Ophthalmic Surgery, three months. Three groups of examinations have to be passed. Preliminary Scientific Examination, including Physics and Chemistry, Botany and Zoology. The Intermediate Medical Part I., including Anatomy and Institutes of Medicine (Practical Histology and Physiology). The Intermediate Medical Part II., including Applied Anatomy and Applied Physiology; and the Final Examination, which is divided into Part I., Materia Medica, Jurisprudence, and Pathology; and Part II., Medicine, Surgery, Midwifery, Gynæcology, Clinical Medicine, Mental Diseases, Clinical Surgery, Operations, and Clinical Ophthalmology. Part I. may be passed in the fourth year and Part II. in the fifth year. Fee for the *Liceat ad Examinandum*, £10. Fee for the degrees, £17.

Doctor in Medicine.—A Doctor in Medicine must have passed all the qualifying examinations and must be a B.A. of three years' standing. He must also read a thesis before the Regius Professor of Physic. Total amount of fees for this degree, £13.

Master in Surgery.—A Master in Surgery must be a Bachelor in Surgery of the University of Dublin of not less than three years' standing, and must produce satisfactory evidence of having been engaged for not less than two years from the date of his registration in the study, or study and practice, of his profession. He must then pass an examination in the following subjects:—1. Clinical Surgery. 2. Operative Surgery. 3. Surgical Pathology. 4. Surgery. 5. Surgical Anatomy (on the dead subject), and one of the following optional subjects:—1. Surgery in one of the following branches—viz., Ophthalmic and Aural, Gynæcological and Dental. 2. Mental Disease. 3. Medical Jurisprudence and Hygiene. 4. Advanced Anatomy and Physiology. 5. Comparative Anatomy. Fee for the degree of Master in Surgery, £11.

Master in Obstetric Science.—A Master in Obstetric Science must be fully qualified and produce a certificate of having attended a summer course in Obstetric Medicine and Surgery. He is then required to pass an examination in the following subjects:—1. Practice of Midwifery. 2. Gynæcology. 3. Anatomy of Female Pelvis and Elementary Embryology. 4. Clinical Gynæcology. Fee for the degree of Master in Obstetric Science, £5.

University Diplomas.—Candidates for the diplomas in Medicine, Surgery, or Obstetric Science must be matriculated in Medicine and must have completed two years in Arts and five years in Medical Studies. The Course and Examination necessary for the diplomas are the same as for the degrees. A diploma in Medicine, Surgery, and Midwifery is a registrable qualification conferred upon candidates who have completed a full five years' course in Medicine and two years in Arts. The diploma, like the degree, qualifies for registration. A diplomate, on completing his course in Arts and proceeding to the degree of B.A., may become a Bachelor by paying the degree fees. Fee for the *Liceat ad Examinandum*, £10. Fee for the diplomas in Medicine, Surgery, and Midwifery, £11.

Professors and Lecturers.—Natural Philosophy: F. Purser, M.A. Anatomy and Surgery: A. F. Dixon, D.Sc., M.B University Anatomist: Sir C. B. Ball, M.D., M.Ch. Physic (Regius): James Little, M.D. Surgery (Regius): Sir C. B. Ball, M.Ch. Surgery: E. H. Taylor, M.D. Botany: H. H. Dixon, D.Sc. Physics: W. E. Thrift, F.T.C.D. Pathology: A. C. O'Sullivan, M.D., F.T.C.D. Institutes of Medicine: W. H. Thompson, M.D., D.Sc. Medicine: J. Magee Finny, M.D. Materia Medica: W. G. Smith, M.D. Midwifery: Sir A. V. Macan, M.B. Jurisprudence and Hygiene: H. T. Bewley, M.D. Chemistry: Sidney Young, D.Sc. Comparative Anatomy and Zoology: H. W. Mackintosh, M.A.

ROYAL UNIVERSITY OF IRELAND.

The position of this University is only temporary if the Irish Universities Bill becomes law. We, however, give the existing regulations.

Candidates for any degree in this University must have passed either the Matriculation Examination or the Senior Grade Examination of the Board of Intermediate Education for Ireland in the subjects prescribed for the Matriculation Examination of this University. Candidates can only claim exemption from the Matriculation Examination of this University by applying for such exemption in the same year in which they shall have passed aforesaid examination. Students from other universities and colleges are included in this rule.

The following degrees, &c., are conferred by the University in this Faculty:—Bachelor of Medicine, Doctor of Medicine, Bachelor of Surgery, Master of Surgery, Bachelor of Obstetrics and Master of Obstetrics; in Sanitary Science, a special diploma; and in Mental Disease, a special diploma.

The course for degrees in Medicine, &c., is of at least five years' duration.

The First Examination in Medicine.—Students may be admitted to this examination after the lapse of one academical year from the time of their matriculation. They must also have previously passed the First University Examination and completed the first year of the medical curriculum. The subjects of this examination are Natural Philosophy, Systematic Chemistry, Zoology and Botany. The examination in each subject will comprise two parts:—(1) a written examination and (2) a practical examination. Particular weight will be given to the practical part of the examination. Candidates at the First Examination in Medicine who at the First University Examination did not obtain 30 per cent. of the marks assigned to French or German will be required to present themselves for a qualifying examination in French or German. Failure to obtain 30 per cent. of the marks assigned to either of those languages will involve the loss of the examination.

The Second Examination in Medicine.—Students will be admitted to this examination after the lapse of one medical year from the time of passing the First Examination in Medicine, provided they have completed the second year of the medical curriculum. The subjects for this examination are Anatomy, Physiology, and Practical Chemistry.

The Third Examination in Medicine.—Students will be admitted to this examination after the lapse of one medical year from the time of passing the Second Examination in Medicine, provided they have completed the third year of the medical curriculum. The subjects for this examination will be Anatomy, Physiology, and Materia Medica (Pharmacology and Therapeutics).

The Examination for the Medical Degrees.—Students will be admitted to this examination after the lapse of not less than one medical year from the time of passing the Third Examination in Medicine, provided they have completed the course of medical studies prescribed for the entire medical curriculum. The examination consists of three parts or divisions:—(*a*) Medicine, including Therapeutics and Pathology, Mental Diseases, Medical Jurisprudence and Sanitary Science. (*b*) Surgery, Theoretical, Clinical, Operative; Surgical Anatomy, with Ophthalmology and Otology; Surgical Pathology. (*c*) Midwifery and Diseases of Women and Children. Each part of this examination must be passed as a whole. Upon completing satisfactorily his examination in all three divisions the candidate will, in addition to the parchment diplomas recording his admission to the Medical Degrees of M.B., B.Ch., and B.A.O., receive a certificate of having passed a qualifying examination in the subjects of Medicine, Surgery, and Midwifery. The fee for this certificate is £10, which must be paid prior to the candidate's admission to these Degrees.

The M.D. Degree.—Candidates may present themselves for the examination for this degree after the lapse of three academical years from the time of obtaining the degrees of M.B., B.Ch., B.A.O. They must at the same time produce a certificate of having been, for at least two academical years, engaged in hospital or private, medical, surgical, or obstetrical practice, or in the military or naval medical service. Every candidate will be examined at the bedside, and required to diagnose at least three medical cases, and prescribe treatment, and to write detailed reports on at least two cases to be selected by the examiners and to discuss the questions arising thereon.

The M. Ch. Degree.—This degree will be conferred only on graduates in Medicine of the University of at least three years' standing. They must at the same time produce a certificate of having been, for at least two academical years, engaged in hospital or private, medical, surgical, or obstetrical practice, or in the military or naval medical service. The examination for this degree will comprise Surgical Diseases and Surgery, both theoretical and operative; Surgical Anatomy; Ophthalmology and Otology; Surgical Pathology; and will include—(*a*) a written examination; (*b*) a clinical examination; (*c*) an examination on Surgical Instruments and Appliances; and (*d*) an examination in Operative Surgery.

The M.A O. Degree.—This degree will be conferred only on graduates in Medicine of the University of at least three years' standing. They must at the same time produce a certificate of having been, for at least two academical years, engaged in hospital or private, medical, surgical, or obstetrical practice, or in the military or naval medical service. The examination will comprise the Theory and Practice of Midwifery and of Diseases of Women and Children, Pathology, and the Use of Instruments and Appliances and will include—(*a*) a written examination; (*b*) a clinical examination so far as practicable; and (*c*) an oral examination, with practical illustrations.

UNIVERSITY OF WALES.

This University has now the privilege of granting degrees in Medicine and Diplomas in Public Health. At the three constituent Colleges of Aberystwyth, Bangor, and Cardiff there are Professors of Chemistry, Botany, Zoology, and Physics, so that the students of the University can obtain proper instruction in the ancillary subjects. The foundation of a Medical Faculty has been laid at University College, Cardiff, where there is a recognised school of medicine.

University College, Cardiff: School of Medicine.—All classes are open to both men and women students who may spend three out of their five years of medical study at Cardiff. The courses of study are recognised as qualifying for the Preliminary Scientific and Intermediate Examination in Medicine in the University of London and for the corresponding examinations in the other Universities. Students who are preparing for these examinations may compound for their courses by paying a fee of £57 10*s.*, while a composition fee of £41 10*s.* includes all the necessary courses for the first and second examinations for the Diploma of the Conjoint Board. In all cases the composition fees may be paid by instalments. Hospital instruction is given at the Cardiff Infirmary. The attention of students about to matriculate is drawn to the numerous entrance scholarships and exhibitions, varying in value from £10 to £30 per annum, offered for competition at University College, Cardiff, in September next, most of which may be held by medical students. Full particulars of the examination for these may be obtained by application to the Registrar. In the department of Public Health established in 1899 instruction is given qualifying for the D.P.H. examinations. Further information may be obtained from the Dean of the Faculty of Medicine.

Lecturers.—Physics: Professor A. L. Selby. Chemistry: Professor C. M. Thompson. Zoology: Professor W. N. Parker. Botany: Professor A. H. Trow. Anatomy: Professor David Hepburn. Physiology: Professor J. B. Haycraft. Materia Medica and Therapeutics: Dr. W. Mitchell Stevens. Bacteriology: Mr. H. A. Schölberg. Hygienic Chemistry: Mr. Sugden. Public Health and Hygiene: Dr. E. Walford and Dr. W. Williams. Midwifery (for Midwives): Dr. E. J. Maclean.

EXAMINING BOARD IN ENGLAND BY THE ROYAL COLLEGE OF PHYSICIANS OF LONDON AND THE ROYAL COLLEGE OF SURGEONS OF ENGLAND.[4]

Any candidate who desires to obtain both the Licence of the Royal College of Physicians of London and the diploma of Member of the Royal College of Surgeons of England is required to complete five years of professional study at recognised Medical Schools and Hospitals and to comply with the following regulations and to pass the examinations hereinafter set forth. Six months of the curriculum may be spent in an Institution recognised by the Board for instruction in Chemistry, Physics, Practical Chemistry, and Biology.

Professional Examinations.—There are three Examinations, called herein the First Examination, the Second Examination, and the Third or Final Examination, each being partly written, partly oral, and partly practical. These examinations will be held in the months of January, April, July, and October, unless otherwise appointed. Every candidate intending to present himself for examination is required to give notice in writing to Mr. F. G. Hallett, secretary of the Examining Board, Examination Hall, Victoria Embankment, W.C., 14 clear days before the day on which the examination commences, transmitting at the same time the required certificates.

The subjects of the *First Examination* are—Chemistry, Physics, Elementary Biology, and Practical Pharmacy. A candidate may take this examination in three parts at different times (Chemistry and Physics must be taken together until the required standard is reached in both or in one of these subjects, but a candidate will not be allowed to pass in one without obtaining at the same time at least half the number of marks required to pass in the other). A candidate will be admitted to examination in Chemistry and Physics, in Practical Pharmacy, and Elementary Biology on producing evidence of having passed the required Preliminary Examination and of having received instruction in these subjects at a recognised institution, or he may take Pharmacy at any time during the curriculum. (*Note:* In the case of students who commence their professional studies after June 1st, 1904, certificates must be produced of 180 hours' instruction and laboratory work in chemistry; 120 hours' instruction and laboratory work in physics; and 120 hours' instruction and laboratory work in biology. These courses need not be completed within one year, nor need they run concurrently, and they may be commenced or attended before the candidate passes the required preliminary examination in general education.) Synopses of the subjects of examination may be obtained on application. A candidate rejected in one part or more of the First Examination will not be admitted to re-examination until after the lapse of a period of not less than three months from the date of rejection, and he will be re-examined in the subject or subjects in which he has been rejected. If referred in Chemistry, Physics, or Biology he must produce evidence of further instruction at a recognised Institution. Any candidate who shall produce satisfactory evidence of having passed an examination for a degree in Medicine on any of the subjects of this examination conducted at a university in the United Kingdom, in India, or in a British colony will be exempt from examination in those subjects in which he has passed.

The fees for admission to the *First Examination* are as follows: For the whole examination, £10 10*s.*; for re-examination after rejection in Parts I. and II., £3 3*s.*; and for re-examination in each of the other parts, £2 2*s.*

The subjects of the *Second Examination* are Anatomy and Physiology. Candidates will be required to pass in both subjects at one and the same time. Candidates will be admissible to the Second Examination on production of the required certificates of professional study. The study of Anatomy and Physiology before passing in two of first three parts of the First Professional Examination is not recognised.

A candidate referred on the *Second Examination* will be required, before being admitted to re-examination, to produce a certificate that he has pursued, to the satisfaction of his teachers, in a recognised place of study, his Anatomical and Physiological studies during a period of not less than three months subsequently to the date of his reference.

The fees for admission to the *Second Examination* are: £10 10*s.* for the whole examination and £6 6*s.* for re-examination after rejection.

The subjects of the *Third* or *Final Examination* are: Part I. Medicine, including Medical Anatomy, Pathology, Practical Pharmacy, Therapeutics, Forensic Medicine, and Public Health. Candidates who have passed in Practical Pharmacy at the First Examination will not be re-examined in that subject at the Third Examination. Part II. Surgery, including Pathology, Surgical Anatomy, and the use of Surgical Appliances. Part III. Midwifery and Diseases Peculiar to Women. Candidates may present themselves for examination in Midwifery and Diseases of Women at any time after the completion of the fourth year of professional study at a Medical School and Hospital, not less than one year after passing the Second Examination, on production of the required certificates. Candidates may present themselves for examination in Medicine and Surgery at the completion of the five years' curriculum, not less than two years from the date of passing the Second Examination, on production of the required certificates. Candidates may take this examination in three parts *at different times*, or *they may* present themselves for the whole examination at one time. They will be required *to produce the following evidence before being admitted to* the several parts of the *Third* or *Final Examination*—viz., in Medicine, of having attended Lectures on Medicine, Pathology including Bacteriology, Pharmacology, and Therapeutics, Forensic Medicine, and Public Health; Practical Instruction in Medicine; Medical Hospital Practice during two winter and two summer sessions; Demonstrations in the Post-mortem Room during 12 months; Clinical Lectures on Medicine during nine months; of having discharged the duties of Medical Clinical Clerk; Instruction in the Administration of Anæsthetics; Practice of a Fever Hospital and Clinical Demonstrations at a recognised Lunatic Asylum; in Surgery, of having attended Lectures on Surgery and Pathology including Bacteriology; Practical Instruction in Surgery; of having performed operations upon the Dead Subject; Surgical Hospital Practice during two winter and two *summer sessions*; Demonstrations in the Post-mortem Room during 12 months; Clinical Lectures on Surgery during nine months; of having discharged the duties of Surgical Dresser; Instruction in the Administration of Anæsthetics; and Clinical Instruction in Ophthalmology; in Midwifery of having attended Lectures on Midwifery; Practical Instruction in Midwifery; Clinical or other Lectures, with Practical Instruction in Diseases Peculiar to Women; and of attendance on 20 Labours.

---

[4] The diploma of Member of the Royal College of Surgeons of England and the Licence of the Royal College of Physicians of London are no longer granted separately except to students who commenced their professional study prior to Oct. 1st, 1884.

The fees for admission to the *Third* or *Final Examination* are as follows: For the whole examination, £21. Part I. For re-examination in Medicine, including Medical Anatomy, Pathology, Therapeutics, Forensic Medicine, and Public Health, £5 5*s.*; for re-examination in Practical Pharmacy (if taken at this examination), £2 2*s.* Part II. For re-examination in Surgery, including Pathology, Surgical Anatomy, and the use of Surgical Appliances, £5 5*s.* Part III. For re-examination in Midwifery and Diseases Peculiar to Women, £3 3*s.*

A candidate referred on the *Third or Final Examination* will not be admitted to re-examination until after the lapse of a period of not less than three months from the date of rejection and will be required, before being admitted to re-examination, to produce a certificate, in regard to Medicine and Surgery, of having attended the Medical and Surgical Practice, or the Medical or Surgical Practice, as the case may be, during the period of his reference; and in regard to Midwifery and Diseases Peculiar to Women a certificate of having received, subsequently to the date of his reference, not less than three months' instruction in that subject by a recognised teacher.

Students of recognised universities in England, Scotland, and Ireland, who have passed examinations for a degree in Medicine at their universities in the subjects of the First and Second Examinations of the Examining Board, may enter for the Final Examination at the expiration of two years from the date of passing in Anatomy and Physiology, on production of the required certificates.

Graduates in Medicine of certain recognised Indian, Colonial, and Foreign universities may present themselves for the Final examination under special conditions which can be ascertained on application to the Secretary.

ROYAL COLLEGE OF PHYSICIANS OF LONDON.

In addition to the diplomas granted by the English Conjoint Board, the Royal College of Physicians of London and the Royal College of Surgeons of England grant honour diplomas, which no longer give the right to practise professionally if held separately. The Royal College of Physicians of London has two such diplomas, the *Fellowship* which is a purely honorary distinction and the *Membership* which is obtained by examination.

Membership.—Every candidate for the Membership of the College must furnish proof of having attained the age of 25 years. Candidates must not be engaged in trade, dispense medicine, make any engagement with a chemist, or any other person for the supply of medicine, or practise medicine or surgery in partnership, by deed or otherwise. Any candidate being already registered or having passed a qualifying examination in accordance with the Medical Act of 1886, who has obtained the degree of Doctor or Bachelor of Medicine at a University in the United Kingdom, in India, or a British colony, or who has obtained a foreign qualification entitling him to practise medicine or surgery in the country where such qualification has been conferred, wherein the courses of study and the examinations *to be undergone previously to graduation have been adjudged* by the Censors' Board to be satisfactory, will (if the Censors *think fit*) be admitted to the Pass Examination. The nature and extent of this examination will, in the case of each candidate, be determined by the Censors' Board. All other candidates must produce proof of having passed the examinations required for the Licence of the College. The examination is directed partly to pathology and partly to the practice of medicine and may be modified in circumstances to be ascertained by application to the Registrar. For example, candidates under 40 years of age are examined in an ancient or modern language, a test from which their seniors are exempt. The fee for admission as a *Member of the College* is 40 guineas, except when the candidate for Membership is a Licentiate of the College, in which case the fee already paid for the Licence shall be deducted from the 40 guineas. The fee for the examination is £6 6*s.*

Fellowship.—The *Fellows* are selected annually from the ranks of the *Members*

ROYAL COLLEGE OF SURGEONS OF ENGLAND.

The Royal College of Surgeons of England confers its diploma of Fellow upon a few distinguished persons in an honorary capacity. Two Members of long standing may also be elected to the Fellowship annually. But the bulk of the Fellows obtain the diploma as the result of examination.

Fellowship.—The examination for the Fellowship is divided into two parts—viz., the First Examination and the Second Examination. The subjects of the First Examination are Anatomy and Physiology and the questions on these subjects may require an elementary acquaintance with Comparative Anatomy and Physiology. The examination is partly written and partly *vivâ voce*. The subjects of the Second Examination are Surgery, including Surgical Anatomy and Pathology. The examination is partly written and partly *vivâ voce* and includes the examination of patients and the performance of operations on the dead body. The examinations are held during the months of May and November of each year.

The fees for examination are:—First Examination, each admission, five guineas. Second Examination, each admission, 12 guineas. Of such examination fees 17 guineas will be reckoned as part of the fee payable upon admission to the Fellowship. The fee to be paid upon admission to the Fellowship is 30 guineas, except when the candidate is a Member of the College, in which case the fee is 20 guineas.

A Member of the College is admissible to the First Examination at any time after receiving his Diploma of Membership. A candidate who is not a member of the College is admissible to the *first Professional* Examination for the Fellowship on the production of evidence of having passed the First and Second Examinations of the Examining Board in England by the Royal College of Physicians of London and the Royal College of Surgeons of England *(or, if a* member of a University recognised by the College for the purpose, of having passed the Examinations in his University equivalent to the First and Second Examinations of the Board) and on the production of certificates of attendance upon certain courses of study described in the Regulations.

A Member of the College is admissible to the Second Examination at any time after having passed the First Examination, on producing satisfactory evidence of having been engaged not less than six years in the study (or study and practice) of the profession.

A candidate who is not a Member of the College must possess the registrable surgical and medical degrees recognised by the Council and must have been engaged in the study (or study and practice) of the profession for not less than four years subsequent to the date of obtaining the recognised qualification, one year of which shall have been spent in attendance on the Surgical Practice of a recognised hospital. The diploma of Fellow is not conferred upon successful candidates until they have attained the age of 25 years.

The Regulations may be obtained on application to the Secretary of the Examining Board, Examination Hall, Victoria Embankment, London, W.C.

ROYAL COLLEGE OF PHYSICIANS OF EDINBURGH, ROYAL COLLEGE OF SURGEONS OF EDINBURGH, AND FACULTY OF PHYSICIANS AND SURGEONS OF GLASGOW.

These Colleges have made arrangements by which, after one series of examinations, held in Edinburgh or Glasgow, or both, the student may obtain the diplomas of the three Bodies.

The three Bodies grant their Single Licences only to candidates who already possess legal qualifications in Medicine or Surgery. Copies of the Regulations for the Single Licence of any of the Bodies may be had on application to the respective secretaries. The regulations which follow are for candidates who commenced study after Jan. 1st, 1892.

Professional Education.—I. The candidate must produce certificates or other satisfactory evidence of having attended the following separate and distinct courses of instruction: Physics, three months; Elementary Biology, three months; Chemistry, six months; Practical or Analytical Chemistry, three months; Anatomy, during at least six months; Practical Anatomy, twelve months; Physiology, six months; Materia Medica, three months; Pathology (including Practical Pathology), six months; Practice of Medicine, six months; Clinical Medicine, nine months; Principles and Practice of Surgery, six months; Clinical Surgery, nine months; Midwifery and the Diseases of Women and Children, three months; Medical Jurisprudence and Public Health, three months. The number of lectures certified as attended at any school not situated in Scotland should not be less than three-fourths of the total number of lectures delivered in a course. II. The candidate must also produce the following certificates:—(*a*) Of having personally attended not less than six cases of labour, or alternatively attendance on 12 cases of labour, at least five of these to be conducted personally under the direct superintendence of the practitioner who signs the certificate, who must be a registered medical practitioner, but the practical midwifery applicable to students commencing medical study on and after Oct. 1st, 1908, is as follows: 1. Every student before commencing the study of Practical Midwifery shall have attended a course of lectures on Surgery and Midwifery and be required to have held the offices of Clinical Medical Clerk and Surgical Dresser. 2. Every student shall be required either—(1) to have attended the indoor practice of a lying-in hospital or the lying-in wards of a general hospital for a period of three months to the satisfaction of the medical officer in charge, and after having received therein practical instruction in the conduct of labour, under the personal supervision of a medical officer, to have conducted 12 cases of labour under official medical supervision; or (2) to have conducted not less than 12 cases of labour, subject to the following conditions—That he has during one month given regular daily attendance upon the indoor practice of a lying-in hospital or the lying-in wards of a general hospital or Poor-law infirmary having a resident medical officer recognised for that purpose by any of the licensing bodies, and that he has therein conducted cases of labour under the personal supervision of a medical officer of the hospital or infirmary, who shall, when satisfied of the student's competence, authorise him to conduct outdoor cases under official medical supervision. 3. No certificate that the student has conducted the above-mentioned 12 cases of labour shall be accepted unless it is given by a member of the staff of a lying-in hospital or of the maternity charity of a general hospital or of a dispensary having an obstetric staff recognised for that purpose by any of the licensing bodies or of a Poor-law infirmary having a resident medical officer so recognised. (*b*) Of having attended, for three months, instruction in Practical Pharmacy; the certificate to be signed by the teacher, who must be a member of the Pharmaceutical Society of Great Britain, or the superintendent of the laboratory of a public hospital or dispensary, or a registered practitioner who dispenses medicines to his patients, or a teacher of a class of Practical Pharmacy. (*c*) Of having attended for 27 months the Medical and Surgical practice of a public general hospital containing on an average at least 80 patients available for clinical instruction and possessing distinct staffs of physicians and of surgeons. Evidence must be produced that the candidate has acted as Surgical Dresser and Medical Clinical Clerk for not less than three months in the wards in each case. (*d*) Of having attended for six months the practice of a public dispensary specially recognised by any of the above authorities, or the out-patient practice of a recognised general hospital or of having acted for six months as pupil to a registered practitioner who either holds such a public appointment, or has such opportunities of imparting practical knowledge as shall be satisfactory to the coöperating authorities; this attendance should be made after the student has passed the First and Second examinations. (*e*) Of having been instructed in the Theory and Practice of Vaccination by a Public Vaccinator authorised by the Local Government Board to grant certificates of proficiency in vaccination and of having performed operations under the teacher's inspection during a period of not less than six weeks.

In addition to the courses above prescribed candidates are required to attend the following courses: Diseases and Injuries of the Eye, three months; Insanity, three months; Infectious Diseases, three months.

The curriculum lasts for five years; the fifth year should be devoted to clinical work at one or more public hospitals or dispensaries. The period of three years devoted to hospital practice may include clinical instruction in special subjects, and should also include instruction in administration of anæsthetics and attendance at post-mortem examinations. The student's regularity of attendance in the wards and out-patients' departments of the hospitals and at the post-mortem examinations should be duly ascertained and noted on the certificate.

Candidates shall be subjected to four professional examinations:

First Examination.—The First examination shall embrace the following subjects—(1) Physics, (2) Chemistry, including Practical Chemistry, and (3) Elementary Biology. The fees payable for admission to the First examination shall be for the whole examination, £5; for each subject separately, £2 10s.

Second Examination.—The Second examination shall embrace Anatomy and Physiology including Histology; and candidates may be admitted to this examination at the end of the second year of medical study. The fees payable for admission to the Second examination shall be—for the whole examination, £5, and for re-entry after rejection, £3 for both subjects, and for each of the subjects separately, £3, and for re-entry for each subject after rejection, £2.

Third Examination.—The Third examination shall embrace Pathology and Materia Medica with Pharmacy. The fees payable for admission to the Third examination shall be—for the whole examination, £5; for re-entry in both subjects after rejection, £3; and for each of the subjects separately, £3, and for re-entry for each subject after rejection, £2.

Final Examination.—The Final examination shall not be taken earlier than the end of the fifth year of study and shall embrace the following subjects:—Medicine, including Therapeutics, Medical Anatomy, and Clinical Medicine; Surgery, including Surgical Anatomy, Clinical Surgery, and Diseases and Injuries of the Eye; Midwifery and Diseases of Women and of New-born Children; and Medical Jurisprudence and Public Health, but it is optional to candidates who have passed the Third Examination to be admitted to each of the subjects of the Final Examination on lodging certificates of having attended the necessary course or courses in that subject—viz., in Medical Jurisprudence and Public Health at any time; in Medicine and Surgery and Midwifery, at any time after the end of the fifth Winter Session, provided the Final Examination is completed within 15 months of passing any one of the three latter subjects. All candidates shall be subjected, in addition to the written and oral examinations, to clinical examinations in Medicine and Surgery, which shall include the

Examination of Patients, Physical Diagnosis, the Clinical use of the Microscope, Examination of the Urine and Urinary Deposits, Surgical Appliances, Bandages, Surface Markings, &c. The fees payable for the Final examination shall be,—for the whole examination, £15, for re-entry in all subjects after rejection, £5, and for each of the subjects separately, £5, with £3 for re-entry in each subject.

Candidates who enter on the footing of having passed the earlier examination at another Board shall pay the fees in respect of these examinations, as well as the Final examination fees.

There are six periods of examination annually, four in Edinburgh and two in Glasgow, and candidates may present themselves at either examining centre irrespectively of the place of the previous examination. The Registrar in Edinburgh is Mr. J. Robertson, solicitor, 54, George-square; and the *Registrar in Glasgow*, Mr. A. Duncan, *LL.D.*, 242, St. Vincent-street, to whom fees and certificates must be sent for the respective examinations.

ROYAL COLLEGE OF PHYSICIANS OF EDINBURGH.

In addition to the diplomas granted by the Scottish Conjoint Board the Royal College of Physicians grant honour diplomas which no longer give the right to practise professionally if held separately, and also grant their Single Licence to candidates already possessing legal qualifications for professional practice.

The Royal College of Physicians of Edinburgh grants a *Membership* and a *Fellowship.*

Membership.—A candidate, who must be a Licentiate of the College of Physicians or a graduate of a British or Irish University and 24 years of age, is examined in medicine, therapeutics, and in any branch of the departments of medicine, such as general pathology, psychology, public health; obstetrics, tropical medicine, or medical jurisprudence. A candidate who for 40 years has been in the practise of his profession may be excused any or all of the examination. The fee for the Membership is £36 15*s.*, 15 guineas of which will be returned to any successful candidate who was already a Licentiate of the College at the time of qualifying for the Membership.

Fellowship.—The Fellows are selected, save with rare exceptions, from the ranks of the *Members.* They must be 25 years of age. The fee is £64 18*s.*

The College grants its *Single Licence* on terms similar to those of the Royal College of Surgeons of Edinburgh, as mentioned in the next section.

ROYAL COLLEGE OF SURGEONS OF EDINBURGH.

The Royal College of Surgeons of Edinburgh grants a diploma of Fellowship after examination to the holders of the surgical degrees of diplomas of such British examining bodies, as well as of the holders of such surgical degrees of the Universities of Canada, Australia, New Zealand, and the Indian Empire as are recognised by the College. The candidates for the examination must be 25 years of age and must have been engaged in practice for at least two years The examination is of a practical nature, partly written and partly *viva voce*, and must include surgery and surgical anatomy, operative surgery, and clinical practice. One optional subject must also be taken, the range of these specialisms covering every branch of medicine. The fee to be paid on entering for examination for Fellowship is £45, £15 of which will be returned to those who already hold the Licentiateship of the College. One month's notice of intention to present himself for examination must be given by the candidate to Mr. D. L. Eadie, 54, George-square, Edinburgh, clerk to the College, together with credentials signed by two Fellows of the College, one of whom must be a resident in Edinburgh, unless a special application be made to the President of the College. In exceptional circumstances registered medical practitioners who have distinguished themselves in the practice of their profession are admitted to the Fellowship without examination.

The Royal College of Surgeons of Edinburgh admits to the examination for its Single Licence any candidate who already holds a Diploma in Medicine of any British, Indian, or Colonial university or of any British or Colonial College of Physicians, or of the Society of Apothecaries of London or Apothecaries' Hall, Dublin, granted under the provisions of the Medical Act, 1886, whose preliminary examination and course of professional study is proved to be sufficient to fulfil the requirements of the College, or to those who have passed a full examination for any of the above. Female practitioners are now admitted to the Licence of the College but not to the Fellowship, and the regulations for the Licence apply to practitioners of either sex.

Every candidate for a surgical diploma must have followed his course of study in a university, or in an established school of medicine, or in a provincial school specially recognised by the College of Surgeons of that division of the United Kingdom in which it is situate.

Under the title Established School of Medicine are comprehended the medical schools of those cities of Great Britain and Ireland in which Diplomas in Surgery are granted, and such colonial and foreign schools as are similarly circumstanced in the countries in which they exist.

Professional Examination for the Diploma of the College.—Candidates for the Diploma of the College will be subjected to one professional examination, partly in writing and partly practically and orally.

Opportunities for the examinations will be presented four times in each year. On each of these occasions the candidates will assemble to write answers to the questions proposed, and the clinical and oral examinations shall be conducted on the days immediately succeeding.

Unsuccessful candidates will be remitted to their studies for a period to be determined by the judgment of the examiners, but not in any case for less than three months.

The examination will embrace the principles and practice of surgery (including operative surgery and surgical pathology), clinical surgery, and surgical anatomy, and will not take place before the termination of the full period of study.

Applications for examination must be made to Mr. D. L. Eadie, not later than one week prior to the date of examination.

On the production of the required documents Mr. Eadie will give the candidate an order authorising the examiners to admit him to examination.

The fee of £15 15*s.* payable to the College must be lodged in the hands of Mr. Eadie not later than one week preceding the examination day. The sum of £10 10*s.* will be returned to each unsuccessful candidate. Under special circumstances candidates can be examined on days other than those fixed by the regulations. The fee for a special examination is as follows, viz., £20 for examination, of which £10 will be returned to candidates remitted on examination.

In order to test more effectually the practical knowledge of candidates recent dissections and anatomical specimens will be employed during examination. They will also be subjected to a practical clinical examination in the Surgical Hospital, including the application of surgical apparatus, bandages, surface markings, &c., and may, if it be considered necessary to test their knowledge, be required to perform operations on the dead body.

THE FACULTY OF PHYSICIANS AND SURGEONS OF GLASGOW.

Like the preceding corporations, the Faculty of Physicians and Surgeons of Glasgow grant a Fellowship and a Licence to be held as separate qualifications.

Fellowship.—The Fellowship of the Faculty is granted after examination in medicine or surgery, together with an optional subject, which may be anatomy or physiology or be selected from any special branch of medicine or surgery, and 14 days' notice must be given by the candidate of his intention to present himself to Mr. Alexander Duncan, LL.D., the Faculty Hall, Glasgow. The fee for the Fellowship is £30, £10 of which sum are returned to any successful candidate who already holds the Licence of the faculty. In certain circumstances Fellows may be elected as a mark of distinction.

Licence.—The Licence of the faculty is granted as a separate qualification to qualified practitioners in Medicine after examination *in surgery, including* surgical anatomy and clinical surgery. The fee is 15 guineas.

ROYAL COLLEGE OF PHYSICIANS AND ROYAL COLLEGE OF SURGEONS, IRELAND.

Every candidate for the Conjoint Examinations of the Colleges shall produce evidence of having before entering on medical studies, passed a Preliminary Examination in general education recognised by the Royal Colleges. Each candidate before receiving his diplomas must produce a registrar's certificate or other satisfactory evidence that he has attained the age of 21 years.

Preliminary Examination.—The subjects for examination are identical with those prescribed for the Preliminary Examination by the General Council of Medical Education and Registration.

Professional Examinations.—Every Candidate must pass four Professional Examinations—at the end of the first, second, third, and fifth years respectively of his professional studies. No candidate shall be admitted to the Final or Qualifying Examination within three months of his rejection at the Final or Qualifying Examination by any other Licensing body.

First Professional Examination.—Every candidate is required, before admission to the First Professional Examination, to produce evidence—(1) of having passed in the subjects of the Preliminary Examination; and (2) of having attended a course of—(*a*) lectures on Theoretical Chemistry, six months; (*b*) Practical Chemistry, three months; (*c*) Biology, three months; and (*d*) Physics.

The subjects of the First Professional Examination are the following:—1. (*a*) Chemistry; (*b*) Physics. 2. Biology. The fee for this examination is £15 15*s.*

Second Professional Examination.—Candidates are not admissible to this examination till they have passed in the subjects of the First Professional Examination and they must produce evidence of having attended (*a*) the practice of a medico-chirurgical hospital for nine months; (*b*) anatomical dissections, six months; and Lectures on (*a*) Anatomy, six months; (*b*) Physiology, six months; (*c*) Practical Physiology and Histology, three months.

The subjects of the Second Professional Examination are the following:—(1) Anatomy; and (2) Physiology and Histology. The fee for this examination is £10 10*s.*

Third Professional Examination.—Every candidate is required, before admission to the Third Professional Examination, to produce evidence of having passed the Second Professional Examination and certificates of having attended courses of instruction in (*a*) the practice of a medico-chirurgical hospital for nine months; (*b*) Pathology:—(1) Systematic, (2) Practical, three months each; (*c*) Materia Medica, Pharmacy, and Therapeutics, three months; (*d*) Forensic Medicine and Public Health, three months.

The subjects for the Third Professional Examination are the following:—(1) Pathology; (2) Materia Medica, Pharmacy, and Therapeutics; (3) Public Health and Forensic Medicine. The fee for this examination is £9 9*s.*

Final Professional Examination.—Before admission to the Final Examination candidates must have passed the Third Professional Examination and produced evidence of having attended in Division 1 the practice of a medico-chirurgical Hospital for nine months (unless such evidence has been previously produced for admission in Division 2); the practice of a recognised fever hospital or the fever wards of a recognised clinical hospital, three months; clinical instruction in Mental Diseases, one month (12 attendances); Lectures on Medicine, six months at a recognised medical school; of having performed the duties of medical clinical clerk in a recognised hospital for three months. In Division 2 of having attended the practice of a medico-chirurgical hospital for nine months (unless such evidence has been previously produced for admission to Division 1); clinical instruction in Ophthalmic and Aural Surgery, three months; lectures on Surgery, six months at a recognised Medical School; instruction in Operative Surgery, three months at a recognised medical school; of having performed the duties of surgical dresser in a recognised hospital for three months. In Division 3 of having attended a midwifery hospital or maternity and having been present at 20 labours, six months; instruction on Vaccination, six attendences to be certified by a public vaccinator; lectures on midwifery (including diseases peculiar to women and to new-born children), six months at a recognised medical school. Candidates are recommended to present themselves in all the subjects of the Final Examination at one time, but a candidate at or after the end of the fourth year may present himself in any one of the Divisions 1, 2, or 3, provided he has completed his curriculum as far as concerns the division in which he presents himself. The examination in at least one of the divisions must be deferred till be end of the fifth year.

The subjects of the Final Examination are: (1) Medicine, including Fevers, Mental Diseases, and Diseases of Children; (2) Surgery, Operative and Ophthalmic; and (3) Midwifery and Gynæcology, Vaccination, and Diseases of New-born Children. The fee is £6 6*s.* Further particulars can be obtained from the Secretary of the Committee of Management, Royal College of Physicians, Kildare-street, Dublin.

ROYAL COLLEGE OF PHYSICIANS OF IRELAND.

The College issues its Licences in Medicine and in Midwifery to practitioners whose names appear on the Medical Register of the United Kingdom.

The Licence in Medicine.—The subjects of examination are: Practice of Medicine, Clinical Medicine, Pathology, Medical Jurisprudence, Midwifery, Hygiene, and Therapeutics.

The Licence in Midwifery.—Candidates must produce certificates of registration. A registered medical practitioner of five years' standing is exempted from the examination by printed questions.

Fees.—Fee for the Licence to practise Medicine, £15 15*s.* Fee for examination for the Licences in Medicine and Midwifery, if obtained within the interval of a month, £16 16*s.* —to be lodged in one sum. (*Any candidate who has been rejected at the examination for the Licence in Medicine loses this privilege and will be required to pay the full fee of five guineas for the Licence in Midwifery.*) Fee for special examination for the Licence to practise Medicine, £21. Fee for examination for the Licence to practise Midwifery, £5 5*s.* Fee for special examination for the Licence to practise Midwifery, £10 10*s.* The examinations for these Licences are held in the week following the first Friday in February, May, and November.

The Membership.—Examinations for Membership are held in January, April, July, and October. The fee for the examination is £21 to Licentiates of the College, or £36 15*s.* to non-Licentiates. Further particulars can be obtained from the Registrar of the Royal College of Physicians of Ireland, Kildare-street, Dublin.

ROYAL COLLEGE OF SURGEONS IN IRELAND.

The Licence in Surgery.—Candidates who hold registrable surgical diplomas (including the Licence of the Apothecaries' Companies of London and Dublin granted since October, 1886) are admitted to examination without further evidence of study. Candidates who hold medical qualifications only (including the L.S.A. granted before October, 1886) will be required to produce certificates of two courses of lectures in Anatomy and Dissections, one course of Practical Histology, one course of lectures in Surgery, and one course of Operative Surgery. Candidates are examined in Surgery, Clinical Surgery, Operative Surgery on the subject, Surgical Appliances, and Ophthalmic Surgery. The examination is partly written, partly *vivâ voce*, and partly practical. The fee is £26 5*s.*, of which £5 5*s.* is retained by the College in the case of unsuccessful candidates.

Diploma in Midwifery.—A diploma in Midwifery is granted after examination to persons possessing a registrable qualification. Candidates must produce evidence of (*a*) attendance on a course of lectures on Midwifery and Diseases of Women and Children in some school recognised by the Council; (*b*) attendance on six months' practice in connexion with a recognised lying-in hospital or dispensary for lying-in women and children; and (*c*) of having conducted at least 30 labour cases. The fee for the examination is £15 15*s.*, of which £5 5*s.* is retained by the College in case the candidate is unsuccessful.

Fellowship Examinations.—A candidate for the Fellowship shall make application to the President and Council to be admitted to examination and if the Council decide to entertain that application it shall lie on the table for at least a fortnight for consideration before it is put to the Council for approval. All the required evidences of study or qualification, fees, and testimonials as to character must be submitted previously to the application being considered, and the candidate shall then, if approved by the Council, be admitted to the next Sessional examination or to a special examination if granted by the Council, at such date as the President may fix. In order that these regulations may be carried out candidates are required to lodge their applications complete with the Registrar at least one month before the date of examination. Sessional Fellowship examinations commence, so far as arrangements permit, on the third Mondays in February, May, and November. Special examinations may be granted at other times by the Council if they see fit, on sufficient cause being shown, except during the months of August and September. Candidates for the Fellowship examination are divided into two Grades: I., Licentiates or Graduates in Surgery of less than 10 years' standing; II., Licentiates or Graduates in Surgery of more than 10 years' standing. Students not either Licentiates or Graduates in Surgery are permitted to present themselves for the *Primary* examination under Grade I.

Grade I.—Candidates are required to pass two examinations—Primary and Final. Candidates may present *themselves for the Final* examination immediately after passing the Primary part, provided they have complied with the necessary regulations. The subjects for the Primary examination are (*a*) Anatomy, including Dissections; and (*b*) Physiology and Histology.

The *subjects* for the Final examination are (*a*) Surgery, including Clinical and Operative Surgery; and (*b*) Surgical Pathology.

Grade II.[5]—The subjects for examination are (*a*) Surgical Anatomy; (*b*) Surgery, including Clinical and Operative Surgery; and (*c*) Surgical Pathology.

Fees.—Grade I.:—For Licentiates of the College: for Primary examination, £15 15*s.*; for Final examination, £10 10*s.* For *Licentiates* in Surgery of other licensing bodies: *for* Primary examination, £26 5*s.*; for Final examination, £15 15*s.* For Students of the College: for Primary *examination*, £5 5*s.*; for Final examination, £21. For Students of other licensing bodies: for Primary examination, £10 10*s.*; for Final examination, £31 10*s.* Grade II.:—Licentiates of the College, £26 5*s.*; *Licentiates* in Surgery of other licensing bodies, £42; extra fee for Special examination, £10 10*s.*

In case of rejection £10 10*s.*, in addition to the special fee, if such has been paid, is retained by the College and is not allowed in the fees of re-examination.

A rejected candidate *will not be* again admitted to examination until *after* a period of three months.

Further particulars can be obtained *from the Registrar of* the College, Stephen's-green, West Dublin.

SOCIETY OF APOTHECARIES OF LONDON.

There are two examinations—Primary and Final. The Final examination is divided into *Section I.* and Section II. The Primary examination is held quarterly. Final examinations are held monthly. No *examinations* are held in the month of September.

The Primary examination *consists* of two parts. Part I. Elementary Biology; Chemistry, Chemical Physics, including the Elementary Mechanics of Solids and Fluids, Heat, Light, and Electricity; *Practical* Chemistry; and Materia Medica and Pharmacy. A synopsis indicating the range of the subjects in the examination will be *sent* with the regulations on application. Evidence of instruction in *these subjects* must be produced prior to examination. Part II. includes Anatomy, Physiology, and *Histology*. *This* examination cannot be passed before the completion of twelve months' Practical Anatomy with Demonstrations, and *these subjects* cannot be taken separately except in the event of the candidate having previously passed *in one*. Evidence must be produced of the candidate's course of *study*. A schedule for the Primary examination, to be obtained of the Secretary, must be signed by the *Dean* of the Medical School or other authority. Section I. of the Final examination consists of three parts. Part I. includes the Principles and Practice of Surgery, *Surgical* Pathology, and Surgical Anatomy, Operative Manipulation, Instruments, and Appliances. Part II. includes the Principles and Practice of Medicine, Pharmacology, *Pathology*, and Morbid Histology; Forensic Medicine, Hygiene, Theory and Practice of Vaccination; and Mental Diseases. Part III. includes Midwifery, Gynæcology, and Diseases of New-born Children *and* the Use of Obstetric Instruments and Appliances. *Section* I. of the Final examination cannot be passed before the expiration of 45 months after registration as a medical student, during which time not less than three winter sessions and two summer sessions must have been passed at one or more of the medical schools connected with a general hospital recognised by the Society. Section II. of the Final examination consists of two Parts. Part I. Clinical Surgery; Part II. Clinical Medicine and Medical Anatomy. Section II. cannot be passed before the end of the fifth year.

The course of study for the *Primary examination* is as follows:—Elementary Biology, not less than three months; Chemistry and Chemical Physics, six months; Practical Chemistry, three months; Pharmacy and Dispensing, three months; Anatomy, six months; Practical Anatomy with Demonstrations, 12 months; Physiology, six months; Histology with Demonstrations, three months. The study of these subjects must be pursued at a Medical School recognised by the Society. *Instruction in Pharmacy* and Dispensing must be given by a registered medical practitioner or by a member of the Pharmaceutical Society by examination or in a public hospital, infirmary, or dispensary.

The course of study for the *Final examination, Section I.*, includes attendance on the Surgical and Medical Practice (with Post-mortem Examinations) at a hospital connected with a medical school for a period of one winter and one summer session; lectures on the Principles and Practice of Surgery, six months; Practical Surgery, three months; *Clinical* Surgical Lectures, nine months; Dressership, six months; Performance of Surgical Operations on the Dead Body; lectures on Principles and Practice of Medicine, six months; Pathology, three months; Clinical Medical *Lectures, nine* months; Clinical Clerkship, six months; Forensic Medicine, Hygiene, and Insanity, three months; Midwifery and Gynæcology, three months; Clinical Instruction in the same, three months; a course of Practical Midwifery; attendance on 20 Midwifery cases. The course of medical study must extend over the above-mentioned period of 45 months and the offices of dresser or clinical clerk must be held at a hospital, or other institution recognised by the Society.

The course of study for the *Final examination, Section II.*, includes either attendance on the Practice of Medicine and Surgery at a hospital or other institution recognised by the Society for a further period of 12 months, or six months as above and six months as a pupil of a registered practitioner holding a public medical or surgical appointment, or attendance at two special hospitals for six months (three months at each hospital), and for six months at a general hospital, all such hospitals to be recognised by the Society. Evidence shall also be given of practical instruction in Infectious Diseases and in Mental Diseases (at a lunatic asylum or in the wards of an institution containing a special ward set apart for the treatment of mental diseases), and in any two of the following subjects: Ophthalmic Surgery, Laryngology with Rhinology and Otology, Dermatology, and Diseases of Children. No candidate is eligible for the *Final* examination who has not completed the curriculum prescribed by the Society, in evidence of which a *schedule*, to be obtained of the Secretary, must be produced, signed by the Dean of the Medical School or other authority. Prior to Section II. of the Final examination the candidate must produce certificates: (1) of being 21 years of age; (2) of moral character; (3) of the *course of medical* study; (4) of proficiency in vaccination signed by a teacher authorised by the Local Government *Board*; *and* (5) of instruction in the administration of anæsthetics. Candidates intending to present themselves for examination are required to give 14 days' notice. A form for this purpose will be sent on application.

Licentiates are eligible for the Membership of the Society of Apothecaries. Particulars may be obtained on application to the clerk.

The fee for the Licence is 20 guineas. The examination offices are open from 10 A.M. to 4 P.M.; on Saturdays from 10 A.M. to 1 P.M. All letters should be addressed to the *Secretary*, Court of Examiners, Society of Apothecaries of *London*, Blackfriars, E.C.

APOTHECARIES' HALL OF IRELAND.

The Licence of this Hall is granted to students who present certificates of having fully completed the course of study as laid down in the curriculum and who pass the necessary examinations. The diploma of the *Apothecaries' Hall* of Ireland entitles the holder to be registered as a practitioner in medicine, surgery, and midwifery, with also the privileges of the Apothecary's Licence. There are four professional examinations, the total fees for which amount to 21 guineas. Ladies are eligible for the diploma. Registered medical practitioners will receive the diploma of the Hall upon passing an examination in the subject or subjects not covered by their previous qualifications and on paying a fee of 10 guineas. If medicine or surgery be required five guineas extra will be charged.

---

[5] On and after Jan. 1st, 1910, all Examinations *for* the Fellowship will be conducted under the scheme now known as Grade I. No candidate after the *above date* will, in any circumstances, be admitted to examination for the Fellowship of this College under the Scheme now known as Grade II., which will then cease to be used.

The fees payable for each examination are as follows:—first professional, £5 5*s.*; second, £5 5*s.*; third, £5 5*s.*; final examination, £6 6*s.* If a candidate gives three clear days' notice of his inability to attend he may present himself at the ensuing examination without a further fee. A candidate is allowed for each professional examination which he has completed at any other licensing body except the final. If he has passed in some only of the subjects in a given examination he has to pay the whole of the fee for that examination. The fees for re-examination are for each subject £1 1*s.*, except in the subjects of chemistry, pharmacy, surgery, medicine, anatomy, pathology, physiology, and ophthalmology, the fees for which are two guineas each. The fee for the third and final or final alone is £15 15*s.* when the other examinations have been taken elsewhere. All examination fees are to be lodged in the National Bank of Ireland, College Green, to the credit of the Examination Committee. Applications and schedules, together with bank receipt for the fee, must be lodged with the Registrar, Apothecaries' Hall, 40, Mary-street, Dublin, at least 14 clear days before the first day of examination.

There are four examinations—first, second, third, and final. They are held quarterly on the third Monday in January, April, July, and October. The first examination comprises biology, physics, theoretical and practical chemistry (with an examination at the bench). Pharmacy is put down in this examination, but it may be taken at any of the first three examinations. Candidates holding a Pharmaceutical licence are exempt from this subject. The second examination comprises anatomy of the whole body (including practical dissections), physiology and practical histology. The third examination comprises pathology, materia medica, medical jurisprudence, and hygiene. The final examination comprises medicine, including clinical and oral, surgery, including operations, clinical and oral, ophthalmic surgery, including clinical and oral, midwifery, and gynæcology.

Candidates who desire to obtain the Letters Testimonial of the Apothecaries' Hall in Ireland must before proceeding to the final examination produce evidence of having been registered as medical students for 57 months, also of having attended courses of instruction as follows:—one course each (of six months) of the following: anatomy (lectures), chemistry (theoretical), midwifery, practice of medicine, physiology, surgery, and dissections, two courses of six months each. Courses of three months: materia medica, medical jurisprudence, chemistry (practical), practical physiology and histology, operative surgery, physics, clinical ophthalmology, biology, clinical instruction in mental disease, pathology, and a course in vaccination. Medico-chirurgical hospital, 27 months to be distributed, at the student's own discretion, over the last four years of his study. The candidate may substitute for nine months in this hospital attendance, six months as a resident pupil. He will be required to present a certificate of having taken notes of at least six medical and surgical cases recorded under the supervision respectively of a physician and surgeon of his hospital. Three months' study of fever—which may be included in his 27 months' hospital attendance—in a hospital containing fever wards, and having taken notes of five cases of fever—viz., either typhus fever, typhoid fever, scarlet fever, small-pox, or measles. Six months' practical midwifery and diseases of women during the winter or summer of the third or the fourth year at a recognised lying-in hospital or maternity. Three months' practical pharmacy in a recognised clinical hospital or a recognised school of pharmacy, or a year in the compounding department of a licentiate apothecary or a pharmaceutical chemist. Each candidate before receiving his diploma must produce evidence that he has attained the age of 21 years. Each candidate must produce evidence of having before entering on medical studies passed a preliminary examination in general education recognised by the General Medical Council and of having been registered by that Council as a student in medicine. Certificates of medical study will not be recognised if the commencement of the course to which the certificate refers dates more than 15 days prior to such registration, except in the subjects of physics or biology. This registration is not undertaken by the Hall. The details of the course of education required and syllabus of the examinations will be supplied on application to the Registrar at 40, Mary-street, Dublin.

UNIVERSITY OF BRUSSELS.

British and other practitioners holding registrable qualifications are admitted to the examination for the Doctorate of the University of Brussels without further curriculum. It is essentially a practitioner's examination and is separate from that intended for the Belgian students who take up the medical curriculum of the University. The fees are—For matriculation, £8 12*s.*; for 1st Part, £4 4*s.*; for 2nd Part, £4 8*s.*; for 3rd Part, £4 8*s.*; for legalisation of diploma, 8*s.*—total, £22. Candidates who have paid in advance the fees for the three examinations, and are unsuccessful in the first, recover the fees paid for the second and third; those who fail in the second recover the fees paid for the third examination. Unsuccessful candidates are allowed to come up again three months after rejection on payment of examination fees only, provided this second appearance be in the course of the same academical year (October 1st to June 30th), otherwise they must renew the payment of the matriculation fee of £8 12*s.* The examination consists of three parts, viz.—1st Part: General Medicine; Materia Medica and Pharmacology; General Surgery; and Theory of Midwifery. 2nd Part: General Therapeutics; Pathology and Morbid Anatomy, with use of the microscope; Special Therapeutics and Medicine of Internal Diseases, including Mental Diseases; and Special Surgery. 3rd Part: Public and Private Hygiene; Medical Jurisprudence; Clinical Medicine; Clinical Surgery; examination in Operative Surgery, consisting of some of the usual operations on the dead subject—viz., Amputation, Ligature of an Artery, &c.; Ophthalmology; examination in Midwifery, consisting in obstetrical operation on the mannikin (model of pelvis); and examination in Regional Anatomy with Dissection. The time required for the three examinations seldom exceeds ten days, and is usually less. Candidates have the option of passing each part separately or of taking the three together, and the latter is the usual course; also of demanding a written examination on payment of an additional fee of one guinea for each part, a rule of which candidates rarely or never avail themselves. The examinations, which are *vivâ voce*, begin on the first Tuesday in November, December, February, May, and June. Candidates should appear with their diplomas at the Secretary's office not later than 2 P.M. on the day preceding the examination. Most of the examiners speak English and those who do not examine through the medium of an interpreter. Great importance is attached to practical knowledge, but candidates must also possess sound theoretical knowledge, the standard required varying with the subject. Pathological and other specimens are not usually shown. There are in England at present over 600 graduates holding this degree, and a British Association of Brussels Medical Graduates has been in existence for many years. Applications should be made to the Secrétariat, 14, Rue des Sols, Bruxelles.

METROPOLITAN MEDICAL SCHOOLS.[1]

ST. BARTHOLOMEW'S HOSPITAL.—The clinical practice of the hospital is large. The hospital contains 744 beds, of which 674 are for patients in the hospital at Smithfield and 70 for convalescent patients at Swanley.

This hospital receives within its walls more than 7000 in-patients annually and its out-patients and casualties amount to more than 126,000 annually.

Special departments have been organised for Diseases of Women and Children, the Eye, Ear, Larynx, and Skin, as well as for Orthopædic and Dental Surgery in which Chief Assistants and Clinical Assistants are appointed annually. There is an Electrical Department, including X Ray, &c. Surgical operations take place every day at 1.30 P.M. and Surgical Consultations are held on Thursdays at the same hour. The physicians and surgeons deliver clinical lectures weekly *during both the winter and the summer sessions.* Clinical Lectures on all special subjects are also given. The visits of the physicians and surgeons are made at 1.30.

---

[1] For Scholarships see p. 657 *et seq.*

Ten house physicians and ten house surgeons are appointed annually. During their first six months of office they act as "junior" house physicians and house surgeons and receive a salary of £25 a year. During their second six months they become "senior" house physicians and house surgeons and are provided with rooms by the hospital authorities and receive £80 a year as salary. A resident midwifery assistant of an ophthalmic house surgeon and a house surgeon for disease of the throat, nose, and ear are appointed every six months, and are provided with rooms and receive a salary of £80 a year. Two assistant anæsthetists are appointed annually, and receive salaries of £120 and £100 respectively, with rooms. An extern midwifery assistant is appointed every three months, and receives a salary of £80 a year. The clinical clerks, the obstetric clerks, the clerks to the medical out-patients, the dressers to the surgical in-patients and to the out-patients, and the dressers in the special departments are chosen from the students. All the appointments are now free. A residential college is attached to the hospital.

New Buildings.—The new buildings that have been recently opened comprise residential quarters for the resident staff, new casualty, medical, surgical, and special out-patient departments, new casualty wards, dispensary, and clinical lecture theatre. A new chemical laboratory has been added, available for the Medical School, and affording facilities for instruction in Public Health. A second new Block which will be devoted to Pathology will be opened in October.

The Medical School Buildings include three large lecture theatres, a large dissecting room, a spacious library (containing 13,000 volumes), a well-appointed museum of anatomy, physiology, comparative anatomy, materia medica, botany, and pathological anatomy. The pathological museum is the most complete in the kingdom. There are laboratories for chemistry, physiology, pathology, chemical pathology, pharmacology, physics, public health, and biology, giving ample accommodation in every department.

Special Classes for the Final F.R.C.S. are held twice yearly.

Instruction in Preliminary Science is given to University of London students in chemistry, biology, and physics throughout the year.

Laboratory Instruction for the D.P.H. is provided during the winter and summer sessions, and elementary instruction in Bacteriology is also given throughout the year.

The recreation ground of 10 acres is at Winchmore Hill for the use of the members of the Students' Union, which all students are expected to join. Additional rooms for the Students' Union have recently been added, viz.: (*a*) a large reading and smoking room; (*b*) a committee and writing room; and (*c*) luncheon and dining hall. These are in the new block.

Staff.—Consulting Physicians: Sir William S. Church, Bart., K.C.B., Dr. Hensley, Sir Lauder Brunton, Bart., F.R.S., Dr. Gee, and Sir Dyce Duckworth. Consulting Surgeons: Sir Thomas Smith, Bart., K.C.V.O., Mr. Willett, Mr. Butlin, Mr. Marsh, and Mr. Langton. Consulting Ophthalmic Surgeon: Mr. Henry Power. Physicians: Dr. Norman Moore, Dr. Samuel West, Dr. Ormerod, Dr. Herringham, and Dr. Tooth, C.M.G. Surgeons: Mr. Harrison Cripps, Mr. Bruce Clarke, Mr. Anthony Bowlby, C.M.G., Mr. Lockwood, and Mr. D'Arcy Power. Assistant Physicians: Dr. Garrod, Dr. Calvert, Dr. Morley Fletcher, Dr. Drysdale, and Dr. Horton-Smith-Hartley. Assistant Surgeons: Mr. Waring, Mr. Eccles, Mr. Bailey, Mr. Rawling, and Mr. Gask. Physician Accoucheur: Dr. Champneys. Physician Accoucheur with charge of out-patients: Dr. W. S. A. Griffith. Surgeon to Obstetric Wards: Mr. Harrison Cripps. Assistant Physician Accoucheur: Dr. Williamson. Ophthalmic Surgeons: Mr. Jessop and Mr. Holmes Spicer. Surgeon, Throat and Nose *Department*: Mr. W. D. Harmer. Assistant Surgeon, Throat and Nose Department: Mr. F. A. Rose. Aural *Surgeon*: Mr. Cumberbatch. Assistant Aural Surgeon: Mr. C. E. West. Dental Surgeons: Mr. Paterson and Mr. Ackland. Assistant Dental Surgeons: Dr. Austen and Mr. Coleman. Medical Officer in charge of Electrical Department: Dr. *Lewis* Jones. Assistant Medical Officer to Electrical Department: Dr. H. Walsham. Pathologist: Dr. Andrewes. Administrators of Anæsthetics: Mr. Gill and Mr. Cross. Assistant Administrators of Anæsthetics: Mr. Boyle and Mr. Trewby. Medical Registrars: Dr. Horder and Dr. Langdon Brown. *Surgical Registrar:* Mr. *Gordon* Watson. *Casualty Physicians*: Dr. Hudson and Dr. Pritchard.

Lectures and Demonstrations.—Medicine: Dr. Norman Moore and Dr. S. West. Clinical Medicine: Dr. Norman Moore, Dr. S. West, Dr. J. A. Ormerod, Dr. W. P. Herringham, and Dr. H. H. Tooth. Practical Medicine: Dr. J. H. Drysdale and Dr. Horton-Smith-Hartley. Surgery: Mr. W. Bruce Clarke and Mr. D'Arcy Power. Clinical Surgery: Mr. Harrison Cripps, Mr. W. Bruce Clarke, Mr. Anthony Bowlby, Mr. C. B. Lockwood, and Mr. D'Arcy Power. Practical Surgery: Mr. L. B. Rawling and Mr. G. E. Gask. Operative Surgery: Mr. R. C. Bailey, Mr. W. McAdam Eccles, and Mr. L. B. Rawling. Midwifery and the Diseases of Women and Children: Dr. F. H. Champneys and Dr. W. S. A. Griffith. Practical Midwifery: Dr. J. A. Willett. Pathology: Dr. F. W. Andrewes. Bacteriology (advanced): Dr. E. E. Klein. Chemical Pathology: Dr. A. E. Garrod. Morbid Anatomy and Post Mortems: Dr. T. J. Horder, Dr. Langdon Brown, and Mr. Watson. Practical Pathology: Dr. H. Thursfield, Mr. R. C. Elmslie, Dr. Pritchard, and Mr. W. G. Ball. Ophthalmic Medicine and Surgery: Mr. W. H. Jessop. *Diseases of the Eye*: Mr. W. H. Jessop and Mr. W. Holmes Spicer. Ophthalmic Demonstrations: Mr. W. Holmes Spicer. Diseases of the Ear: Mr. A. E. Cumberbatch and Mr. C. E. West. Diseases of the Larynx: Mr. W. D. Harmer and Mr. F. E. Rose. Orthopædic Surgery: Mr. W. McAdam Eccles. Diseases of the Skin: Dr. J. A. Ormerod. Diseases of Children: Dr. A. E. Garrod and Dr. H. Morley Fletcher. Medical Electricity and Electro-therapeutics: Dr. H. Lewis Jones. Mental Diseases and Insanity: Dr. T. Claye Shaw. Dental Surgery: Mr. W. B. Paterson and Mr. R. C. Ackland. Anæsthetics: Mr. R. Gill, Mr. W. F. Cross, Mr. H. E. G. Boyle, and Mr. F. Trewby. Forensic Medicine: Dr. W. P. Herringham. Descriptive and Surgical Anatomy: Dr. C. Addison. Practical Anatomy: Dr. C. Addison, Mr. R. B. Etherington-Smith, Mr. H. W. Wilson, and Mr. R. F. Moore. General Anatomy and Physiology: Dr. J. S. Edkins. Practical Physiology: Dr. J. S. Edkins, Dr. W. Langdon Brown, and Dr. C. M. H. Howell. Materia Medica, Pharmacology, and Therapeutics: Dr. James Calvert. Pharmacology: Dr. F. A. Bainbridge. Biology and Comparative Anatomy: Dr. T. W. Shore. Practical Biology: Dr. T. W. Shore, Mr. P. C. V. Jones, and Mr. W. Steuart. Chemistry: Dr. W. H. Hurtley. Practical Chemistry: Dr. W. H. Hurtley and Mr. K. S. Caldwell. *Physics*: Mr. F. Womack. Practical Physics: Mr. F. Womack and Mr. Lloyd Hopwood. Botany: Rev. G. Henslow. Public Health: Dr. George Newman. Sanitary Law: Dr. G. Newman. Museum Curator: Dr. F. W. *Andrewes. Junior Curator:* Dr. W. P. S. Branson. Dean of the School: Dr. T. W. Shore. Warden of College: Mr. G. E. Gask.

CHARING CROSS HOSPITAL.—This hospital and convalescent home contain 257 beds, a certain proportion of which are set aside for the diseases of children and those special to women. The number of patients treated during 1907 amounted to 23,809—viz., 2162 in-patients and 21,647 out-patients, of whom 9558 were casualties. There were 75,080 out-patient attendances. The following hospital appointments are open to students. Clinical Pathologist and Bacteriologist, salary £150 per annum. Curator and Pathologist (annual), £100. Assistant Anæsthetist, £60. Medical and Surgical and Obstetrical Registrars (annual), £40 each. Resident Medical Officer (annual), £100, with board and residence. Six House Physicians, six House Surgeons, and two Resident Obstetric Officers, appointed each year on the recommendation of the committee after competitive examinations, are provided with board and residence in the hospital. Clinical clerks and dressers are appointed in all the general and special departments of the hospital. Arrangements can be made for students who have not entered for the entire curriculum to hold these posts. In the medical school demonstratorships and assistant demonstratorships in various subjects are open to students *of the school* and carry honoraria. Total fees, including students' club:—For general students: 1. Composition fee, payable in one sum on joining, 115 guineas. 2. Sessional payment system: Entrance fee, 10 guineas. In *addition* a sum of 15 guineas must be paid at the beginning of every Winter Session and one of 10 guineas at the beginning of every Summer Session so long as the student remains in the school. For Dental students: The fees for the two years' curriculum required by dental students may be paid: (*a*) in one sum of

55 guineas on entry; (*b*) in two instalments, one of 31 guineas on entry and the second of 30 guineas at the end of the first twelve months. General students pay proportionally lower fees and are admitted without additional fee to the courses of Clinical Medicine and Surgery. They are entitled to compete for the Scholarships which are awarded annually to the value of £500, including two University Scholarships, value 50 guineas and 40 guineas respectively, Gold Medal, Huxley, and Pereira Prizes.

Classes for the Preliminary Scientific and Intermediate Examinations of the University of London and for the Primary F.R.C.S. are held at this Medical School. There are also special classes for the practical work for the Department of Public Health and for the Primary F.R.C.S.

Staff.—Consulting Physicians: Dr. Green, Dr. Bruce, and Dr. Abercrombie. Consulting Obstetric Physician: Dr. J. Watt Black. Physicians: Dr. Mott, Dr. Galloway, and Dr. Hunter. Assistant Physicians: Dr. Bosanquet, Dr. Fenton, Dr. Forsyth, and Dr. Jewesbury. Consulting Surgeons: Mr. Barwell, Mr. Bloxam, and Mr. Morgan, C.V.O. Surgeons: Mr. Boyd, Mr. Waterhouse, and Mr. Wallis. Surgeon to Out-patients: Mr. Gibbs. Assistant Surgeons: Mr. Clogg and Mr. Daniel. Obstetric Physician: Dr. Amand Routh. Obstetric Physician with care of Out-patients: Dr. T. W. Eden. Physician for Diseases of the Skin: Dr. Galloway. Assistant Physician for Diseases of the Skin: Dr. MacLeod. Physician to the Electrical Department: Dr. Ironside Bruce. Surgeon for Nose, Throat, and Ear: Mr. Waggett. Ophthalmic Surgeon: Mr. Treacher Collins. Orthopædic Surgeon: Mr. Fairbank. Surgeon Dentist: Mr. J. F. Colyer. Physician for Mental Diseases: Dr. Mercier.

Lecturers: Winter Session.—Anatomy: Dr. Alexander Macphail. Bacteriology: Mr. Leathem. Biology and Comparative Anatomy: Dr. H. W. Marett Tims. Chemistry and Physics: Dr. H. Forster Morley. Dental Surgery: Mr. J. F. Colyer. Medicine: Dr. James Galloway and Dr. F. W. Mott (Nervous Diseases). Ophthalmology: Mr. E. Treacher Collins. Physiology and Histology: Mr. C. F. Myers-Ward. Practical Anæsthetics: Mr. C. Carter Braine. Practical Anatomy: Dr. Alexander Macphail. Practical Hygiene: Mr. Leathem and Dr. H. Forster Morley. Practical Medicine: Dr. Bosanquet and Dr. Forsyth. Diseases of Women: Dr. Amand Routh and Dr. T. W. Eden. Practical Midwifery: Dr. T. W. Eden. Practical Physiology: Mr. C. F. Myers-Ward. Practical Surgery: Mr. F. C. Wallis, Mr. H. S. Clogg, Mr. Peter Daniel, and Mr. Fairbank. Operative Surgery: Mr. Charles Gibbs. Psychological Medicine: Dr. Mercier. Surgery: Mr. H. F. Waterhouse. Tropical Medicine: Sir Patrick Manson, K.C M.G.

Summer Session.—Anatomy: Dr. Alexander Macphail. Anæsthetics: Mr. C. Carter Braine. Dental Surgery: Mr. J. F. Colyer. Forensic Medicine: Dr. Jewesbury. Materia Medica and Practical Pharmacy: Dr. Fenton. Midwifery: Dr. Amand Routh. Diseases of Women: Dr. Amand Routh and Dr. T. W. Eden. Pathology: Dr. W. Hunter. Pharmacology and Therapeutics: Dr. Fenton. Practical Chemistry: Dr. H. Forster Morley. Practical Medicine: Dr. Bosanquet and Dr. Forsyth. Practical Physiology: Mr. C. F. Myers-Ward. Public Health: Dr. H. T. Bulstrode. Toxicology: Dr. H. Forster Morley. Roentgen Ray: Dr. Ironside Bruce. Dean of the Medical School: Mr. Frederick C. Wallis.

ST. GEORGE'S HOSPITAL.—This hospital contains 336 beds, of which 180 are allotted to surgical and 150 to medical cases. One ward is set apart for Diseases Peculiar to Women. Children's beds are placed in all the women's wards. Two wards are allotted to ophthalmic cases. There are also 100 beds at the Convalescent Hospital at Wimbledon.

The Winter Session commences on Oct. 1st but students can enter at any time or for any particular course. The Hospital and Medical School are situated at Hyde Park-corner and are readily accessible from all parts of London. Entrance Scholarships in Science and Arts and University Scholarships in Anatomy and Physiology are awarded at the commencement of each Winter Session. Prizes: The William Brown Exhibition of £100 per annum (tenable for two years) is awarded by examination to a perpetual pupil of the hospital every second year. The William Brown Exhibition of £40 (tenable for three years) is awarded by examination to a perpetual pupil of the hospital every third year. Other prizes to the value of £200 are awarded annually to the students of the hospital. As the scientific and clinical parts of the medical student's curriculum are entirely separate there is no longer any object in conducting the scientific courses upon hospital premises. The entire teaching and laboratories are therefore now devoted to purely clinical subjects, as in other universities, to the great advantage of students in their fourth and fifth years of study. Arrangements have been made with the University of London for students who enter during the first, second, or third year of the curriculum as students of St. George's to carry out the necessary courses of instruction at either University College or King's College. Students therefore have the unrivalled advantages of the lectures and practical classes of these Colleges of the University during the preliminary and intermediate portions of their studies, and then complete their course, without payment of any entrance fee, in a school entirely devoted to Clinical work. Students are permitted to enter the wards of the hospital at any hour. Dresserships to the surgeons and clinical clerkships to the physicians are open without fee to all students of the hospital. Eight house physicians and eight house surgeons are appointed annually All house appointments are open without fee to every perpetual student of the hospital and are made strictly in accordance with the merits of the candidates. Special attention is directed to the following paid appointments, amongst others, which are open to students after they have held house office:—Medical Registrarship at £200 per annum; Surgical Registrarship at £200; Curatorship of the Museum at £200; Assistant Curatorship at £100; Obstetric Assistantship (Resident) at £50; the post of Resident Anæsthetist at £100; the post of Senior Anæsthetist at £50; the posts (2) of Junior Anæsthetists, each at £30. Great attention is paid by members of the staff to individual teaching. A number of special courses are given in which the requirements of university and other examinations receive careful attention. The following may be cited as examples:—(1) Elementary Bacteriology; (2) Advanced Bacteriology; (3) Clinical Pathology; (4) Systematic Pathology; (5) Histological Pathology and Morbid Anatomy; (6) Pharmacology; (7) Surgical Anatomy; (8) Advanced Anatomy and Physiology; (9) Operative Surgery; (10) Public Health; and (11) Tropical Diseases. Special classes are held by members of the staff for all examinations. The school possesses an Amalgamation Club, with well-fitted reading-, smoking-, and luncheon-rooms on the hospital premises. Students have the advantage of a complete library of medical and scientific books which is kept up-to-date. A register of accredited apartments and a list of medical men and others willing to receive St. George's men as boarders may be seen on application to the Dean. Further information may be obtained from the Dean of the Medical School.

Staff.—Consulting Physicians: Sir Henry Pitman, Dr. W. H. Dickinson, Dr. T. T. Whipham, Sir Isambard Owen, and Dr. Ewart. Consulting Surgeons: Mr. Pick, Mr. Haward, Sir W. Bennett, and Mr. Marmaduke Sheild. Consulting Ophthalmic Surgeons: Mr. Brudenell Carter and Mr. Adams Frost. Consulting Aural Surgeon: Sir William Dalby. Consulting Dental Surgeon: Mr. Winterbottom. Physicians: Dr. H. D. Rolleston, Dr. Ogle, Dr. Latham, and Dr. Collier. Obstetric Physician: Dr. W. R. Dakin. Assistant Physicians: Dr. Spriggs, Dr. Jex-Blake, and Dr. Golla. Assistant Obstetric Physician: Dr. A. F. Stabb. Physician to the Skin Department: Dr. W. S. Fox. Physician Anæsthetist: Dr. F. Hewitt. Surgeons: Mr. C. T. Dent, Mr. G. R. Turner, Mr. F. Jaffrey, and Mr. Pendlebury. Ophthalmic Surgeon: Mr. H. B. Grimsdale. Assistant Surgeons: Mr. T. Crisp English, Mr. L. Jones, and Mr. W. F. Fedden. Surgeon to the Throat Department: Mr. H. S. Barwell. Aural Surgeon: Mr W. C. Bull. Dental Surgeon: Mr. N. G. Bennett. Assistant Dental Surgeon: Mr. Morley.

Lecturers.—Baillie Lecturer in Physic: Dr. Howship Dickinson. Thomas Young Lecturer in Medicine: Professor William Osler. Clinical Medicine: the Physicians and Assistant Physicians. Clinical Surgery: the Surgeons and Assistant Surgeons. Principles and Practice of Physic: Dr. Rolleston, Dr. Ogle, Dr. Latham, and Dr. Collier. Tropical Medicine: Dr. T. S. Kerr. Principles and Practice of Surgery: Mr. Dent, Mr. Turner, Mr. Jaffrey, and Mr. Pendlebury. Midwifery and Diseases of Women and Children: Dr. Dakin. Assistant Lecturer on Midwifery and Diseases of Women and Children: Dr Stabb. Vaccination: Mr. E. Climson Greenwood. Insanity and Clinical Instructor in Insanity: Dr.

Seymour Tuke. Ophthalmic Surgery: Mr. Grimsdale. Diseases of the Skin: Dr. Fox Aural Surgery: Mr. Bull. Diseases of the Throat and Nose: Mr. Barwell. Dental Surgery: Mr. Norman Bennett. Assistant Lecturer on Dental Surgery: Mr. Morley. Practical Medicine: Dr. Jex-Blake. Practical Surgery: Mr. English. Operative Surgery: Mr. L. Jones. Surgical Anatomy: Mr. Fedden. Edward Jenner Lecturer on Public Health: Mr. C. M. Fegen. Hygiene: Dr. H. Spitta. Forensic Medicine and Toxicology: Dr. Trevor. Toxicological Chemistry: Mr. Gardner. Pathological Chemistry: Dr Spriggs. Pathology: Dr. Trevor. Bacteriology: Dr. Slater. Assistant Lecturer on Bacteriology and Lecturer on Clinical Pathology: Dr. Harold Spitta. Materia Medica and Therapeutics: Dr. Cyril Ogle. Pharmacology: Dr. Spriggs Anæsthetics: Dr. Frederic Hewitt, M.V.O. Teacher of Anæsthetics: Dr. Blumfeld. Assistant Teachers of Anæsthetics: Dr. Powell and Mr. Longhurst. Advanced Anatomy: Mr. Jaffrey. Advanced Physiology and Histology: Dr. Buckmaster. Advanced Chemistry and Pharmacological Chemistry: Mr. Gardner. Teacher of Skiagraphy: Dr. Simmons. Curator of the Museum: Dr. Trevor. Assistant Curator of the Museum and Demonstrator in Pathology: Mr J. A. Torrens. Obstetric Tutor: Dr. G. F. Darwall Smith Curator of the Peirse-Duncombe Laboratory: Dr. Harold Spitta. Demonstrator in Materia Medica: Dr. A. Manuel. Medical Tutor: Dr F. W. Higgs. Surgical Tutor: Mr Ivor Back. Dean of the Medical School: Dr. E I. Spriggs.

GUY'S HOSPITAL.—This hospital, founded by Thomas Guy in 1721 for the reception of 400 patients, and enlarged through the aid of a large bequest from the late William Hunt, contains at the present time 602 beds.

House physicians, house surgeons, out-patient officers and assistant house surgeons, obstetric residents, ophthalmic house surgeons, clinical assistants, clerks to anæsthetists, surgeons' and assistant surgeons' dressers, surgical and medical clinical clerks, post-mortem clerks, extern obstetric attendants, and dressers and clerks in the special departments are appointed from among the students upon the recommendation of the medical council according to merit. The house physicians, of whom there are four, hold office for six months each. The out-patient officers, who hold office for three months, attend in the out-patient or casualty department during the week and see all the cases not seen by the assistant physician of the day. The house physicians have the care of the patients in the medical wards and attend to all emergencies arising in the absence of the physicians. They are provided with board and lodging in the college free of expense. The house surgeons, of whom there are four, hold office for six months each and are provided with board and lodging in the college free of expense. The Surgical Casualty Department is in charge of two assistant house surgeons and there are four out-patient officers appointed each three months. The surgeons' dressers are selected from those students who have completed their third winter session and have been most diligent in the junior appointments. They hold office for three or six months. Six are attached to each surgeon and during their weeks of special duty they are provided with board and lodging in the hospital free of expense. The college stands upon a site fronting the east gate of the hospital and is connected with it by a subway. The building serves as a Residential College for Students and at the same time provides accommodation for the Students' Club.

Medical and Surgical Staff.—Consulting Physicians: Sir Samuel Wilks, Bart., Dr. F. W. Pavy, Dr. P. H. Pye-Smith, Dr. J. F. Goodhart, and Dr. F. Taylor. Consulting Surgeons: Mr. Thomas Bryant, Sir H. G. Howse, Mr. W. H. A. Jacobson, Mr. R C. Lucas, and Mr Golding Bird. Consulting Obstetric Physician: Dr. A. L. Galabin. Consulting Physician for Mental Diseases: Dr. G. H. Savage. Consulting Aural Surgeon: Mr. W. Laidlaw Purves. Consulting Anæsthetist: Mr. Tom Bird. Consulting Ophthalmic Surgeons: Mr. C. Higgens and Mr. W. A. Brailey. Consulting Dental Surgeon: Mr. Newland-Pedley. Physicians and Assistant Physicians: Dr. W. Hale White, Dr. G. Newton Pitt, Sir Cooper Perry, Dr. L. E. Shaw, Dr. J. Fawcett, Dr. A. P. Beddard, Dr. H. S French, and Dr. Hertz. Surgeons and Assistant Surgeons: Mr. Charters J. Symonds, Mr. W. Arbuthnot Lane, Mr. L. A. Dunn, Sir Alfred Fripp, C.B., K.C.V.O., Mr. F. J. Steward, Mr. Fagge, Mr. R. P. Rowlands, and Mr. Philip Turner. Obstetric Physicians: Dr. P. Horrocks and Mr. J. H. Targett. Assistant Obstetric Physician: Mr. G. Bellingham Smith. Ophthalmic Surgeons: Mr. H. L. Eason and Mr. A. W. Ormond. Physician in Charge of Skin Department: Sir Cooper Perry. Physician for Mental Diseases: Dr. M. Craig. Surgeon in Charge of Throat Department: Mr. F. J. Steward. Surgeon in Charge of Aural Department: Mr. C. H. Fagge. Dental Surgeons: Mr. W. A. Maggs, Mr. R. Wynne Rouw, Mr. H. L. Pillin, and Mr. M. F. Hopson. Anæsthetists: Mr. G. Rowell, Dr. H. F. Lancaster, Mr. C. J. Ogle, Mr. W. M. Mollison, Mr. A. R. Thompson, and Mr. R. Davies-Colley. Medical Registrars and Tutors: Mr. H. C. Cameron and Mr. C H. Rippmann. Obstetric Registrar and Tutor: Mr. R. Davies-Colley. Surgical Registrars and Tutors: Mr. A. S. Bankart and Mr. T. B. Layton. Actino-Therapeutic Department: Dr. C. E. Iredell. Radiographers: Mr. E. W. H. Shenton, Dr. A. E. Jordan, and Dr. C. J. Morton. Bacteriologist to the Hospital: Dr. W. H. Eyre. Resident Surgical Officer: Mr. S. W. Daw. Hon. Librarian, Wills Library: Dr. L. E. Shaw. Lying-in Charity: Mr. Targett and Mr. Bellingham Smith. Dean of the Medical School: Dr. H. L. Eason. Warden of the College: Mr. W. M. Mollison, M.C.

Lecturers and Demonstrators.—Clinical Medicine: the Physicians and Assistant Physicians. Clinical Surgery: the Surgeons and Assistant Surgeons. Medicine: the Physicians. Practical Medicine: Mr. H. C. Cameron and Mr. C. H. Rippmann. Surgery: Mr. Symonds, Mr. Lane, Mr. Dunn, and Sir Alfred Fripp. Operative Surgery: Mr. R P. Rowlands and Mr. P. Turner. Practical Surgery: Mr. Bankart and Mr. T. B. Layton. Midwifery and Diseases of Women: Dr. Horrocks and Mr. Targett. Practical Obstetrics: Mr. Davies-Colley. Mental Diseases: Dr. Craig. Ophthalmic Surgery: Mr. Eason. Dental Surgery: Mr. Wynne Rouw. Aural Surgery: Mr. Fagge. Diseases of the Skin: Sir Cooper Perry. Diseases of the Throat: Mr. Steward. Anæsthetics: Mr. Rowell. Hygiene and Public Health: Dr. R. King Brown. Pathology: Dr. A. E. Boycott. Gordon Lecturer on Experimental Pathology: Dr. Boycott and Dr. Hertz. Morbid Anatomy: Dr. Fawcett and Dr. French. Morbid Histology and Bacteriology: Dr. Eyre and Dr. Boycott. Medical and Surgical Pathology Classes: Dr. Fawcett and Mr. Steward. Bacteriology: Dr. Eyre. Practical Bacteriology: Dr. Eyre. Forensic Medicine: (vacant). Anatomy: Mr. Steward and Mr. Fagge. Practical Anatomy: Mr. A. R. Thompson, Mr. W. M. Mollison, and Mr. Hughes. Physiology: Dr. Pembrey. Practical Physiology: Dr. Pembrey, Mr. J. H. Ryffel, B.C., and Mr. P. P. Laidlow, B.C. Materia Medica and Therapeutics: Dr. A. P. Beddard. Practical Pharmacy: the Hospital Pharmacist. Chemistry: Dr. Wade. Practical Chemistry: Dr. Wade, Mr. Ball, and Mr. Merriman. Experimental Physics: Dr. Fison and Mr. Merriman. Biology: Mr. Assheton, Dr. Stevens, and Mr. Hughes. Psychology: Dr. Craig.

KING'S COLLEGE AND HOSPITAL.—The Faculty of Medicine at King's College is now divided into two parts; the first is concerned with Preliminary and Intermediate subjects and instruction on these is given in the College laboratories. This department is now designated Faculty of Science (Medical Division); the second deals with the Advanced or Final subjects of the curriculum, instruction on which is given at the hospital, except in subjects like Bacteriology where laboratory courses are necessary.

In the Faculty of Science (Medical Division) the following are the:—

Lecturers on Preliminary and Intermediate Subjects.—Anatomy: Dr. P. Thompson (Professor), Dr. C. J. Jenkins (Lecturer), and Mr. J. E. S. Frazer (Demonstrator). Physiology: Dr. W. D. Halliburton (Professor), Dr. H. W. Lyle (Lecturer). Dr. O. Rosenheim (Lecturer on Chemical Physiology), and Dr. C. S. Myers (Lecturer on Experimental Psychology). Zoology: Dr. A. Dendy (Professor). Botany: Dr. W. B. Bottomley (Professor) and Mr. E. J. Schwartz (Demonstrator). Chemistry: Dr. J. M. Thomson (Professor), Mr. H. Jackson (Assistant Professor). and Mr. P. H. Kirkaldy (Lecturer). Physics: Dr. Wilson. Materia Medica and Pharmacology: Dr. W. E. Dixon (Professor).

Fees.—For London University Course: for Preliminary Scientific (Part I.), 25 guineas; for Preliminary Scientific

(Part II.) and Intermediate M.B., 55 guineas, or two instalments of 30 guineas each. For Conjoint Board Course: for First examination, 20 guineas; for Second examination, 55 guineas, or two instalments of 30 guineas each. For prospectus and further information application should be made to Dr. P. Thompson, Dean of the department.

The advanced or final subjects in the curriculum are dealt with at the Medical School attached to King's College Hospital. The hospital contains 224 beds. 3000 in-patients, 16,000 new out-patient cases, 40,600 casualties, and about 350 midwifery cases are attended yearly. The hospital contains special departments for diseases of women and children, and of the eye, ear, throat and nose, skin and teeth. There are special operation theatres for diseases of women, for eye, and for throat, nose, and ear cases. There is a clinical pathologist and a laboratory in the hospital where histological, bacteriological, hæmatological, and chemical investigations are carried out. In connexion with this is a vaccine department for the treatment of patients suffering from tuberculosis and other infective diseases. The appointments open to students are those of senior clinical assistant to the special departments; senior medical, surgical, and obstetric registrar; and Sambrooke medical and surgical registrars, all of whom receive salaries, as do the medical and surgical tutors. There are 14 resident medical and surgical officers appointed yearly and the usual six senior surgical dressers, medical and obstetric clinical clerks, surgical dressers, and clerks and dressers in all the special departments for in- and out-patients, and post-mortem clerks.

Hospital Staff.—Consulting Physicians: Dr. Alfred B. Duffin, Dr. I. Burney Yeo, and Dr. D. Ferrier. Consulting Surgeons: Lord Lister and Mr. W. Rose. Physicians: Dr. Nestor Tirard, Dr. Norman Dalton, Sir Hugh Beevor, Bart., Dr. Raymond Crawfurd, and Dr. Aldren Turner. Surgeons: Sir W. Watson Cheyne, Bart., Mr. A. B. Barrow, Mr. A. Carless, Mr. F. F. Burghard, Mr. G. L. Cheatle, and Mr. P. T. B. Beale. Assistant Physicians: Dr. Tunnicliffe and Dr. J. C. Briscoe. Obstetric Physician: Dr. John Phillips. Assistant Obstetric Physician: Dr. Hugh Playfair. Physician for the Diseases of Children: Dr. George F. Still. Diseases of the Throat: Dr. StClair Thomson. Dental Surgeon: Mr. A. S. Underwood. Assistant Dental Surgeon: Mr. C. E. Wallis. Ophthalmic Surgeons: Mr. M. M. McHardy and Mr. L. V. Cargill. Aural Surgeons: Dr. Urban Pritchard and Mr. Arthur H. Cheatle. Physician for Diseases of the Skin: Dr. A. Whitfield. Pathological Registrar: Dr. Norman Dalton. Physician in charge of Electrical Department: Dr. W. Aldren Turner. Medical Officer in charge of X Ray Department: Mr. A. D. Reid. Anæsthetist and Instructor in Anæsthetics: Dr. J. F. W. Silk. Assistant Anæsthetist: Dr. G. B. Flux. Clinical Pathologist: Dr. Emery. Senior Medical Registrar and Tutor: Dr. H. W. Wiltshire. Senior Surgical Registrar and Tutor: Dr. T. Percy Legg. Obstetric Registrar and Tutor: Dr. E. L. Holland. Sambrooke Registrars: Mr. N. Hart and Mr. R. H. Gompertz.

Lecturers on Final Subjects.—Medicine (Principles and Practice of): Dr. Nestor Tirard (Professor). Neuro-Pathology: Dr. W. A. Turner (Lecturer). Psychological Medicine: Dr. Ernest W. White (Professor) and Dr. Steen (Demonstrator). Surgery (Principles and Practice of): Mr. A. Carless (Professor). Surgery (Operative): Mr. F. F. Burghard (Teacher). Surgical Pathology: Mr. G. L. Cheatle (Teacher). Obstetric Medicine and Diseases of Women and Children: Dr. John Phillips (Professor). Practical Obstetrics: Dr. Hugh Playfair (Lecturer). Diseases of Children: Dr. G. F. Still (Professor). Pathology: Dr. N. Dalton (Professor). Forensic Medicine: Dr. W. R. Smith (Professor). Hygiene: Dr. W. J. R. Simpson (Professor). State Medicine: Dr. Hewlett (Professor) and Mr. D. Somerville (Demonstrator). Bacteriology: Dr. Hewlett (Professor) and Dr. F. E. Taylor. Ophthalmic Surgery: Mr. M. M. McHardy (Professor). Aural Surgery: Dr. Urban Pritchard (Professor). Dermatology: Dr. A. Whitfield (Professor). Anæsthetics: Dr. J. F. W. Silk. Dental Surgery: Mr. A. S. Underwood (Professor). Diseases of the Skin: Dr. A. Whitfield (Professor).

Fees.—The composition fee for Hospital work and Final subjects of the curriculum is 70 guineas in one sum or in two equal instalments of 36 guineas payable on entrance and on commencement of second year of study respectively. For information and prospectus application should be made to Peyton T. B. Beale, F.R.C.S., Dean of the Hospital. For information regarding fees, curriculum, &c., in Public Health and Bacteriology application should be made to Professor Hewlett.

Athletics.—The King's College Hospital Clubs and Societies Union was formed in 1908 and consists of the Medical and Musical Societies, the Hospital Common Room, and the various athletic and sports clubs. Students become members of the Union at a small annual subscription.

LONDON HOSPITAL.—The hospital has 922 beds in constant use and no beds are closed. Being the only general hospital for East London—i.e., for a million and a half people—the practice is immense. In-patients last year, 14,288; out-patients, 222,279; accidents, 18,702; major operations, 4121. Owing to the enormous number of patients more appointments are open to students than at any other hospital. Receiving-room officers, house physicians, house surgeons, &c.: 94 of these qualified appointments are made annually and more than 150 dressers, clinical clerks, &c., appointed every three months. All are free to students of the College. Holders of resident appointments have free board. Special classes are held for the University of London and other higher examinations. Special entries for medical and surgical practice can be made. Lectures and classes are held throughout the year to suit the requirements of candidates desirous of obtaining the diploma in Public Health. The Lecturer on Public Health has his offices in the College, enabling the candidates to attend daily to work under his supervision. These courses are recognised both by the Universities of Oxford, Cambridge, London, &c., and by the Examining Board in England. A reduction of 15 guineas is made from the perpetual fee to the sons of members of the profession. The new laboratories and class-rooms for Bacteriology, Vaccino-therapy, Public Health, Operative Surgery, Chemistry, and Biology are now in full use. The new Clubs Union Rooms, Garden, and Fives Court are now open. The Clubs Union Athletic Ground is within easy reach of the hospital. The Metropolitan and other railways have stations close to the hospital and the college.

Staff.—Consulting Physicians: Dr. Hughlings Jackson and Sir Stephen Mackenzie. Consulting Surgeons: Mr. Hutchinson, Mr. Couper, Mr. McCarthy, Sir Frederick Treves, Bart., and Mr. Tay. Consulting Obstetric Physician: Dr. Herman. Physicians: Dr. Francis Warner, Dr. Percy Kidd, Dr. Frederick J. Smith, Dr. W. J. Hadley, Dr. Bertrand Dawson, Dr. Henry Head, and Dr. Robert Hutchison. Assistant Physicians: Dr. Lewis Smith, Dr. Wall, Dr. Grünbaum, and Dr. Thompson. Surgeons: Mr. C. W. Mansell-Moullin, Mr. Hurry Fenwick, Mr. F. S. Eve, Mr. J. Hutchinson, jun., Mr. T. H. Openshaw, Mr. H. P. Dean, and Mr. P. Furnivall. Assistant Surgeons: Mr. Rigby, Mr. Sherren, and Mr. Lett. Obstetric Physician: Dr. Lewers. Assistant Obstetric Physician: Dr. Andrews. Physician to the Skin Department: Dr. Sequeira. Consulting Dental Surgeon: Mr. Barrett. Consulting Anæsthetist: Dr. Hewitt. Ophthalmic Surgeons: Mr. A. B. Roxburgh and Mr. Lister. Surgeon to the Throat Department: Dr. Lambert Lack. Aural Surgeon: Mr. Hunter Tod. Medical Officer in charge of the Electrical Department: Dr. E. R. Morton. Physician in charge of the Photo-therapy Department: Dr. Sequeira. Analyst to the Hospital: Mr. Hugh Candy. Bacteriologist to the Hospital: Dr. W. Bulloch. Dental Surgeons: Mr. Farmer, Mr. Scott MacFarlane, and Mr. Watson Turner. Anæsthetists: Dr. Probyn-Williams, Mr. Hilliard, and Mr. Clapham.

Lecturers.—Medicine: Dr. Hadley. Clinical Medicine: the Physicians and Assistant Physicians. Surgery: Mr. J. Hutchinson, jun. Clinical Surgery: the Surgeons and Assistant Surgeons. Anatomy: Dr. Wright. Physiology: Dr. Leonard Hill, Mr. Greenwood, and Mr. Flack. Chemistry: Mr. Hugh Candy. Pathology—General and Surgical: Dr. W. Bulloch. Midwifery and Diseases of Women: Dr. Andrews. Clinical Obstetrics: the Obstetric Physicians. Practical Obstetrics: Dr. Andrews. Forensic Medicine—(1) Public Health: Dr. J. C. Thresh; and (2) Medical Jurisprudence and Toxicology: Dr. F. J. Smith. Public Health and Sanitary Science: Dr. W. Bulloch, Dr. John C. Thresh, and Mr. Candy. Mental Diseases: Dr. J. Kennedy Will. Materia Medica and General Therapeutics: Dr. Francis Warner and Dr. Grünbaum. Biology: Mr. G. P.

Mudge. Experimental Physics: Mr. Hugh Candy, and Mr. Griffith. Ophthalmic Surgery: Mr. A. B. Roxburgh. Diseases of the Throat: Dr. Lambert Lack. Aural Surgery: Mr. Hunter Tod. Anatomy and Pathology of the Teeth: Mr. F. M. Farmer, Mr. Scott MacFarlane, and Mr. Watson Turner. Practical Anatomy: Dr. Wright, Mr. Howard, and Mr. Patterson. Practical Physiology and Histology: Dr. Leonard Hill, Mr. Greenwood, and Mr. Flack. Foods and Dietetics: Dr. R. Hutchison. Practical Chemistry: Mr. Hugh Candy. Operative Surgery: Mr. H. P. Dean. Demonstrators of Morbid Anatomy: Dr. F. J. Smith, Dr. W. J. H. Hadley, Dr. Lewis Smith, and Dr. Wall. Bacteriology: Dr. W. Bulloch and Mr. Twort. Pathological Histology: Dr. W. Bulloch. Inoculation Department: Dr. Western. Therapeutic Electricity and Radiography: Dr. A. E. Morton. Anæsthetics: Dr. R. J. Probyn-Williams. Elementary Clinical Medicine: Dr. Lewis Smith and Dr. Grünbaum. Medical Tutor: Dr. Thompson. Elemental Clinical Surgery: Mr. J. Sherren and Mr. Lett. Surgical Tutor: Mr. Sherren. Obstetric Tutor: Dr. R. D. Maxwell. As Emeritus Professors of Surgery Mr. Hutchinson will give in the Summer Session and Sir Frederick Treves, Bart., will give in the Winter Session a course of lectures in Clinical Surgery. The special subjects and the dates will be announced in due course. Dr. Hewitt, as Emeritus Lecturer on Anæsthetics, will give a course of lectures during the first half of the Winter Session. Warden: Mr. Munro Scott.

St. Mary's Hospital.—The hospital contains 281 beds exclusive of the New Wing which, when opened, will increase the number to 341. *The number of in-patients treated* during 1907 was 3902. The number of out-patients was 23,691 with 23,902 casualty cases, a total of 47,593. The situation of the hospital and Medical School in the centre of the residential districts of Paddington, Bayswater, and North Kensington renders it exceptionally convenient for students' rooms, a register of which is kept by the authorities for the use of students.

Laboratories, &c.—The Medical School provides for the entire curriculum. Special laboratories are in use for Biology, Chemistry, and Physics, a series of lecture theatres and laboratories for anatomy and physiology, and a spacious and well-lighted dissecting-room. The Pathological Department is under the direction of Sir Almroth Wright, F.R.S., and a block of consulting-rooms and laboratories in the New Wing of the Hospital has been equipped for the department of Therapeutic Inoculation to meet the increased amount of work in that department. During the past year 550 patients have received treatment in the department. A special laboratory is provided for the study of chemical pathology.

Appointments.—All clinical appointments in the hospital are free to students of the Medical School and the resident medical officers are chosen by competitive examination. Six house physicians, six house surgeons, and four obstetric officers are appointed in each year and receive board and lodging in the hospital. Two resident anæsthetists are appointed in each year and receive a salary at the rate of £100 *per annum*, with board and lodging. *Two casualty* house surgeons are appointed in each year *upon the same* conditions. Several assistants *in* the department of Therapeutic Inoculation are appointed annually at salaries of £100 per annum and upwards. In addition to the above, the senior appointments, medical and surgical registrar, casualty physician, demonstrator of anatomy, physiology, and *biology* are made annually.

Clubs, &c.—The amalgamated clubs include all the various athletic clubs, as well as the rifle club, medical society, &c. There is a students' club on the Hospital premises, the membership of which is included in the amalgamated clubs. The athletic clubs' ground (eight acres) is situated at North Kensington and can be reached in 20 minutes from the Medical School. It consists of Rugby and Association football grounds, tennis courts, and a large cricket pitch.

Special Tuition.—In addition to systematic courses of lectures and demonstrations special tuition is provided for the Intermediate and Final Examinations of the Universities of Oxford, Cambridge, and London, and for the Primary and Final F.R.C.S.

Preliminary Scientific Course.—Special classes, including lectures and laboratory work, are held throughout the year under recognised teachers of the University of London.

The composition fee for full students is £140 if paid in one sum, or £145 if paid in four *instalments*. University students who have completed their examinations in Anatomy and Physiology are admitted on payment of a composition fee of 60 guineas (£63) paid in one sum or by payment of two annual instalments of 35 guineas (£36 15s.) and 30 guineas (£31 10s.) respectively. University students who have not completed their examination in Anatomy and Physiology pay an annual fee of 25 guineas (£26 5s.) until they have passed these examinations, and then pay the composition fee. Separate courses of lectures, laboratory work, or hospital practice may be taken. The School Calendar and full information can be obtained from the Secretary, St. Mary's Hospital Medical School, Paddington, W.

Staff.—Consulting Physicians: Dr. Cheadle and Dr. Lees. Consulting Surgeons: Mr. A. T. Norton, Mr. Edmund Owen, Mr. Herbert Page, Mr. G. P. Field (Aural), Sir G. Anderson Critchett (Ophthalmic), Sir Malcolm Morris (Skin), Mr. Morton Smale (Dental), and Dr. Scanes Spicer (Throat). Consulting Anæsthetist: Mr. Henry Davis. Physicians: Dr. Sidney Phillips, Dr. A. P. Luff, and Dr. H. A. Caley. Surgeons: Mr. A. J. Pepper, Mr. J. Ernest Lane, and Mr. H. Stansfield Collier. Physicians in charge of Out-Patients: Dr. Wilfred Harris, Sir John Broadbent, and Dr. W. H. Willcox. Surgeons in Charge of Out-Patients: Mr. V. Warren Low, Mr. W. H. Clayton-Greene, and Mr. Maynard Smith. Physician-Accoucheur: Dr. Montagu Handfield-Jones. Physician-Accoucheur in charge of Out-Patients: Dr. W. J. Gow. Physician in charge of Children's Department: Dr. Sidney Phillips. Ophthalmic Surgeon: Mr. H. E. Juler. Assistant Ophthalmic Surgeon: Mr. Leslie Paton. Physician to the Skin Department: Dr. Graham Little. Dental Surgeon: Mr. W. H. Dolamore. Surgeons to the Ear, Nose, and Throat Department: Dr. G. William Hill and Mr. C. I. Graham (assistant). Administrators of Anæsthetics: Dr. Blumfeld and Mr. Collum. Director in Medical Charge of Inoculation Department: Sir A. E. Wright. Dean: Mr. W. H. Clayton-Greene.

Lecturers.—Clinical Medicine: Dr. Sidney Phillips. Clinical Surgery: Mr. A. J. Pepper. Medicine: Dr A P. Luff and Dr. H A. Caley. Surgery: Mr. J. Ernest Lane and Mr. H. Stansfield Collier. Practical and Operative Surgery: Mr. V. W. Low and Mr. Maynard Smith. Pathology: Sir A. E. Wright and Dr. Spilsbury (assistant lecturer). Bacteriology: Sir A. E. Wright and Captain S. R. Douglas (assistant lecturer). Pathological Chemistry: Dr. W. H. Willcox. Midwifery and Gynæcology: Dr. M. Handfield-Jones. Materia Medica and Therapeutics: Dr. H. A. Caley. Forensic Medicine: Dr. Willcox. Neurology: Dr. Harris Descriptive and Surgical Anatomy: Mr. W. H. Clayton-Greene and Mr. Maynard Smith (assistant lecturer). Demonstrator: Dr. V. Z. Cope. Physiology and Histology: *Dr.* N. H. Alcock. Biology: Dr. W. G. Ridewood. Demonstrator: Mr. T. Reed. Chemistry: Dr. G. Senter. Physics: Mr. W. H. White. Hygiene and Public Health: Dr. W. H. Willcox. Mental Diseases: Dr. Theo. B. Hyslop. Diseases of the Eye: Mr. Leslie Paton. Diseases of the Ear, Nose, and Throat: Dr. G. William Hill. Diseases of the Skin: Dr. Graham Little. Dental Surgery: Mr. Dolamore. Medical Tutors: Dr. W. J. Harris, Sir John Broadbent, and Dr. Willcox. Surgical Tutors: Mr. V. Warren Low, Mr. Clayton-Greene, and Mr. Maynard Smith. Obstetric Tutor: Dr. T. G. Stevens. Medical Registrar: Dr. F. S. Langmead. Surgical Registrar: Mr. M. Fitzmaurice Kelly. Department for Nervous Diseases: Dr. W. J. Harris. Practical Pharmacy: Mr. E. A. Andrews (demonstrator). School Secretary: Mr. B. E. Matthews.

Middlesex Hospital.—The hospital contains 345 beds, which includes a special wing for patients suffering from cancer, consisting of four wards, containing 45 beds; here cancer patients are received and attended for a period limited only by the duration of their disease. The number of patients treated last year were: Out-patients, 47,880; in-patients, 3859. Cancer: Out-patients, 87; in-patients, 159.

The Hospital and Medical School are fully equipped for the theoretical and practical teaching of all the subjects included in the examinations in Medicine, and Surgery in the United Kingdom and for the diploma in Public Health; and ample laboratory and class-room accommodation is provided for the teaching of the various subjects of the curriculum and for original research in Medicine, Pathology, or Bacteriology.

Special Classes are held to prepare students for the Inter. M.B. (Lond.) Examination and for the Primary and Final Examinations for the diploma of F.R.C.S. Eng.

Attached to the Cancer Wing of the hospital is a special research laboratory and in connexion with this there are the Emden Cancer Research Scholarship and the Richard Hollins Research Scholarship.

The Bacteriological and Public Health Laboratory for Women Medical Practitioners and Women Students, situated at 27, Mortimer-street, W., is in connexion with this hospital, and is under the direction of Mr. A. G. R. Foulerton, assisted by Dr. Hilda K. Whittingham. This laboratory, for the maintenance of which a private guarantee fund has been raised by some supporters of the hospital who are anxious to provide facilities for the special training of women in Public Health work, has been added to the Middlesex Hospital Medical School for the purposes of providing instruction for women medical practitioners for the examinations for the Diploma in Public Health and for the M.D. in State Medicine of the University of London, and of affording facilities to them and other women students for carrying out research work in Public Health, Bacteriology, and General Pathology.

Hospital Appointments.—All hospital appointments are allotted to students without any extra fee. The following 18 resident appointments—six house physicians, six house surgeons, two obstetric house physicians, two casualty medical officers, and two casualty surgical officers, are annually filled from the pupils of the hospital, each appointment extending over six months.

A Residential College to accommodate a limited number of students adjoins the hospital. Breakfast, luncheon, and dinner are supplied in the College Hall at moderate charges.

The Amalgamated Students' Club includes the following: the Medical Society, the Common Room Society, the cricket club, the football clubs, the athletic clubs, the rowing club, the musical society, the chess club, the lawn tennis club, and the hockey club. The athletic ground, which is eight acres in extent, is situated within easy access at Wormwood Scrubs.

Fees.—The Composition Fee for the entire curriculum is 135 guineas, or 145 guineas if paid in three instalments. The fee for London University students is 145 guineas; for those who have passed the Preliminary Scientific 120 guineas. The fee for the Dental Curriculum is 54 guineas, or 60 guineas if paid in two instalments. Students who have completed the study of Anatomy and Physiology or passed the London Preliminary Scientific M.B. Examination are received on special terms.

Lecturers.—Winter Session: Anatomy: Dr. Cameron. Demonstrator: Dr. Gladstone. Biology and Physiology: Mr. Goodall. Demonstrator: Mr. Earle. Chemistry: Dr. Kellas. Emeritus Lecturer in Medicine: Sir R. D. Powell, Bart., M.D. Medicine: Dr. Pasteur and Dr. Wynter. Practical Medicine: Dr. Voelcker. Emeritus Lecturer in Surgery: Mr. Henry Morris. Surgery: Mr. Pearce Gould, Mr. Bland-Sutton and Mr. Murray. Practical Surgery: Mr. Kellock. Operative Surgery: Mr. Kellock. Practical Midwifery: Dr. Bonney. Pathology: Dr. Voelcker. Forensic Medicine and Toxicology: Dr. Wethered. Clinical Lectures in Medicine: The Physicians. Clinical Lectures in Surgery: The Surgeons. Clinical Lectures on Diseases of the Ear, Throat, and Nose: Mr. S. Paget. Lectures in Ophthalmology: Mr. Lang. Lectures in Dental Surgery: Mr. Nowell. Public Health and Bacteriology: Mr. Foulerton. Summer Session: Pharmacology and Therapeutics: Dr. R. A. Young. Midwifery: Dr. Comyns Berkeley. Pathological Histology: Dr. Voelcker. Practical Toxicology: Dr. Kellas. Mental Diseases: Dr. Mickle. Lectures in Dermatology: Dr. Pringle. Anatomy, Chemistry, and Physiology: as in Winter Session. Tutors—Medicine: Dr. Campbell Thomson; Surgery: Mr. Handley; Obstetrics: Dr. Victor Bonney.

Staff.—Consulting Physicians: Dr. W. Cayley, Dr. Sidney Coupland, and Sir Richard Douglas Powell. Physicians: Dr. J. K. Fowler, Dr. W. Pasteur, and Dr. W. E. Wynter. Physicians to Out-patients: Dr. A. F. Voelcker, Dr. F. J. Wethered, and Dr H. Campbell Thomson (Dean of the Medical School). Assistant Physician: Dr. R. A Young. Consulting Physician to the Skin Department: Dr. R. Liveing. Physician to the Skin Department: Dr. J. J. Pringle. Consulting Obstetric Physician: Dr. W. Duncan. Obstetric Physician: Dr. Comyns Berkeley. Assistant Obstetric Physician: Dr. Victor Bonney. Consulting Surgeons: Mr. Nunn. Mr. Morris, and Mr. Clark. Surgeons: Mr. Gould, Mr. Bland-Sutton, and Mr. Murray. Surgeon to Out-patients: Mr. Kellock. Assistant Surgeons: Mr. Handley and Mr. Gordon Taylor. Ophthalmic Surgeon: Mr. W. Lang. Aural Surgeon: Mr. S. Paget. Dental Surgeon: Mr. Nowell. Curator of the Museum and Pathologist: Dr. Lakin. Registrars: Dr. O. K. Williamson, Mr. Hastings, and Dr. Victor Bonney. Resident Medical Officer: Mr. A. E. Johnson. Anæsthetists: Mr. T. G. A. Burns and Mr. H. P. Noble. Assistant Anæsthetist: Mr. H. Charles.

St. Thomas's Hospital.—This hospital received its present charter from King Edward VI., but as a monastic institution was in existence prior to the year 1207. The building occupies a unique position by the river, opposite the Houses of Parliament, and contains 600 beds. The in-patients last year numbered 6783, whilst the number of attendances as out-patients, including the casualty and light departments, was 217,967. There are departments for the treatment of women, children, the eye, ear, nose and throat, skin, and teeth. Departments for light treatment, x rays, and physical exercises are also special features. Exceptional facilities are offered in the hospital laboratories for the study of general pathology, clinical pathology, and of treatment by serums and vaccines. Surgical operations take place in the main theatres every day except Saturdays at 2 P.M. Clinical teaching in the wards, out-patients' and special departments is available every day of the week. Clinical lectures are delivered every Wednesday and Thursday during the sessions. All appointments in the hospital are open to students without extra fee. Casualty officers and resident anæsthetists, house physicians, house surgeons, obstetric house physicians, ophthalmic house surgeons, and out-patient officers are appointed and hold office for six months. They are provided with rooms and commons in the hospital free of expense. Clinical assistants to all the special departments are appointed every three months; they are non-resident. A resident assistant physician and a resident assistant surgeon, at a salary of £100 each, are appointed biennially; also four hospital registrars (medical, surgical, obstetric, and ophthalmic), the two former receive a salary of £100 and the two latter £50. An assistant in the clinical laboratory, at a salary of £100 per annum, and an assistant pathologist, at a salary of £125, are from time to time appointed. Appointments open to students before qualification: Clinical clerks and dressers for in- and out-patients are selected from students who have completed their third year's work. The accident dressers are provided with board and lodging during their periods of special duty. Every student acts as clerk in the post-mortem room and in one of the pathological laboratories, takes his turn for three weeks on maternity duty under proper supervision, and is practically instructed in the administration of anæsthetics by one of the hospital anæsthetists. On completion of his term as clerk or dresser he is expected to fill appointments in one or more of the special departments. In their earlier years of study students are selected as assistants to the lecturers in the preliminary and intermediate subjects. The Medical School is fully equipped for the teaching of all subjects of the curriculum. A fine museum and large library are at the disposal of the students. There are three lecture theatres, an unusually large and well-ventilated dissecting-room, and special laboratories for biology, chemistry, physics, physiology, and pathology. The post-mortem room, where demonstrations are given every day, is ventilated by the electric fan and provided with cold storage. The Students' Club comprises a spacious restaurant and magnificent smoking and reading room. There is no occasion for students to leave the hospital buildings during working hours. The athletic ground of the Amalgamated Clubs at Chiswick is over nine acres in extent and is easily accessible from Waterloo Station. The curriculum is arranged to meet the requirements of all the Examining Bodies. Special classes are held for the examinations at the University of London and for the First and Final Fellowship Examinations of the Royal College of Surgeons of England. Tutorial classes in all subjects precede the various examinations. There is a special course for the Diploma in Public Health. The hospital is easily accessible from all parts. It is close to the Waterloo and Westminster Bridge Stations (L. & S.W., Bakerloo, and District Railways). Electric trams which pass the doors connect it with all parts of South London. A register of lodgings and a list of medical men and others who are willing to receive boarders is kept by the secretary, Mr. G. Q. Roberts, who will give any further information required.

Fees.—The annual composition fee is 30 guineas—in addition to a fee on entrance. Post-graduate study is afforded to qualified practitioners by a joint ticket which admits to the practice of 14 hospitals (general and special) on terms which may be ascertained from the secretary.

Staff.—Consulting Physicians: Dr. Harley and Dr. Payne. Consulting Surgeon: Mr. S. Jones. Consulting Obstetrical Physician: Dr. Gervis. Consulting Ophthalmic Surgeons: Mr. Liebreich and Mr. Nettleship. Consulting Anæsthetist: Mr. W. Tyrrell. Consulting Dentist: Mr. C. E. Truman. Physicians: Dr. Sharkey, Dr. Acland, Dr. Hawkins, Dr. Mackenzie, and Dr. Turney. Surgeons: Mr. Clutton, Mr. G. H. Makins, C.B., Mr. Battle, Mr. Ballance, M.V.O., and Mr. Robinson. Physicians to Out-patients: Dr. Perkins, Dr. Colman, Dr. Box, and Dr. Russell. Surgeons to Out-patients: Mr. C. S. Wallace, Mr. E. M. Corner, Mr. Sargent, and Mr. C. A. R. Nitch. Obstetric Physician: Dr. Tate. Obstetric Physician to Out-patients: Dr. Fairbairn. Ophthalmic Surgeon: Mr. Lawford. Ophthalmic Surgeon to Out-patients: Mr. Fisher. Physician for Diseases of Children: Dr. Box. Surgeon for Diseases of Children: Mr. C. A. R. Nitch. Surgeon for Diseases of the Throat: Mr. H. B. Robinson. Physician for Diseases of the Skin: Dr. E. Stainer. Surgeon for Diseases of the Ear: Mr. Marriage. Dental Surgeons: Mr. J. G. Turner and Mr. G. L. Bates. Resident Assistant Physician: Dr. Cassidy. Resident Assistant Surgeon: Mr. J. E. Adams. Anæsthetists: Dr. H. Low, Dr. Bevan, Dr. Mennell, and Dr. Hedley. Pharmaceutist: Mr. J. A. Jennings. Curator of Museum: Mr. S. G. Shattock. Director of Laboratories: Mr. Dudgeon. Superintendent of X Ray Department: Dr. Greg.

Lecturers and Demonstrators.—Anatomy: Mr. F. G. Parsons, with Mr. P. W. G. Sargent and Mr. C. A. R. Nitch. Chemistry: Dr. Le Sueur. Physiology: Dr. J. B. Leathes. *Biology: Mr. T. G. Hill.* Pathology and Bacteriology: Mr. Shattock and Mr. Dudgeon. Surgery: Mr. Makins and Mr. Ballance. Medicine: Dr. Sharkey and Dr. Hawkins. Practical and Operative Surgery: Mr. Battle, Mr. Robinson, and Mr. Wallace. Comparative Anatomy: Mr. Parsons. Applied Anatomy: Dr. Box. Anæsthetics: Dr. Low. Physics: Mr. Brinkworth. Clinical Medicine: The Physicians. Clinical Surgery: The Surgeons. Midwifery and Diseases of Women: Dr. Tate and Dr. Fairbairn. Diseases of the Eye: Mr. Lawford and Mr. Fisher. Pharmacology and Therapeutics: Dr. Dixon. Throat Disease: Mr. H. B. Robinson. Physiological Demonstrator: Mr. Mavrogordato Obstetrical Demonstrators: Dr. Fairbairn and Dr. Hedley. Elementary Clinical Medicine: Dr. Perkins, Dr. Colman, Dr Box, and Dr. Russell. Surgical Classes: Mr. Wallace, Mr. Corner, Mr. Fisher, and Mr. Shattock. Forensic Medicine and Toxicology: Dr. Colman and Dr. Haas. Mental Diseases: Dr. R. Percy Smith. Public Health: (vacant). Tropical Medicine: Dr. Sandwith. Instruction in Vaccination by Dr. Cope. Dean of the School: Mr. Cuthbert Wallace. Secretary: Mr. G. Q Roberts, from whom any further information may be obtained.

UNIVERSITY COLLEGE, LONDON.—University College has been constituted a University centre for the teaching of medical sciences. The College Faculty of Medical Sciences comprises the Departments of Physics, Chemistry, Botany, and Zoology (the Preliminary Medical Sciences); also the Departments of Anatomy, Physiology, and Pharmacology (the Intermediate Medical Sciences), and the Departments of Hygiene and Public Health and of Pathological Chemistry (Post-graduate Study).

Faculty of Medical Sciences.—Composition fees.—For the courses required by the University of London. 1. For the Preliminary Scientific Course, 26 guineas, entitling to one attendance and to the privileges of the Union Society (including the use of the gymnasium and the athletic ground at Perivale) for one session. 2. For the Intermediate Course, 58 guineas if paid in one sum; 63 guineas if paid in two instalments of 32 guineas and 31 guineas respectively. This fee entitles to attendance on Anatomy and Physiology during three years and to one attendance on Organic Chemistry, Pharmacology, and Materia Medica, and to the privileges of the Union Society (including the use of the gymnasium and the athletic ground at Perivale) for two sessions.

For the medical education required by the Examining Board in England and the Society of Apothecaries. First examination, Parts I., II., III., 21 guineas, entitling to one attendance and to the privileges of the Union Society (including the use of the gymnasium and the athletic ground at Perivale) for one session. First examination, Part IV., and second examination, 58 guineas if paid in one sum, and 63 guineas if paid in two instalments of 32 guineas and 31 guineas respectively. This fee entitles to attendance during three years and to the privileges of the Union Society (including the use of the gymnasium and the athletic ground at Perivale) for two sessions.

Professors and Lecturers.—1. Preliminary Scientific Course.—Chemistry:—Professor: Sir William Ramsay, F.R.S.; assistant professor: E. C. C. Baly, F.I.C.; assistants: R. W. Gray, Ph.D., N. T. M. Wilsmore, D.Sc., Samuel Smiles, D Sc.; demonstrators: (vacant). Physics:—Professor: F. T. Trouton, F.R S.; assistant professor: A. W. Porter, B.Sc.; assistants: N. Eumorfopoulos, B.Sc, A. O. Rankine, B.Sc. Botany:—Professor: F. W. Oliver, M.A., D.Sc., F.R S.; assistant professor: F. E. Fritsch, D.Sc., Ph.D. Zoology:—Professor: J. P. Hill, D.Sc.; assistants: W. Woodland, B.Sc., and H. B. Fantham, D.Sc. 2. Intermediate Course.—Anatomy:—Professor: G. D. Thane, LL.D.; assistant and curator of the museum: G. S. Hett, M.B.; demonstrators: G. E. Waugh, B.S., F.R.C.S., H. T. Mant, M.B., B.S.; assistant demonstrators: J. H. Farbstein, M.B, B.S.; W. E. Haigh. Physiology:—Professor: E H. Starling, F.R S.; assistant professors: W. M. Bayliss, F.R S, G. A. Buckmaster, M.D.; assistant: R. H. Aders-Plimmer, D.Sc.: lecturers: J. H. Parsons, F.R.C.S, W. Page May, M.D., D.Sc., S. B. Schryver, D.Sc. Pharmacology:—Professor: A. R. Cushny, F.R.S. Organic Chemistry:—Professor: J. N. Collie, F.R.S.; assistant: Samuel Smiles, D Sc.

UNIVERSITY COLLEGE HOSPITAL MEDICAL SCHOOL.—Dean: H. Batty Shaw, M.D., F.R.C.P. Vice-Dean: Raymond Johnson, B.S., F.R.C.S. Fees for Preliminary and Intermediate Course: See under University College. For the Final M.B., B S Course, 80 guineas if paid in one sum, 82 guineas if paid in two instalments, as follows—first year, 50 guineas; second year, 32 guineas. This fee entitles to attendance on Lectures and Hospital Practice during three years and to one attendance on Practical Pathology and Practical Surgery. Vaccination and attendance at a Fever Hospital are not included. Students who obtain a medical qualification within three years of the time of commencing this course are not required to pay an additional fee for further attendance. This course of instruction is also suitable for the corresponding examinations at the Universities of Oxford, Cambridge, and Durham, and for the medical education required by the Examining Board in England and the Society of Apothecaries.

There are 279 beds in the hospital and 54,594 patients were treated last year.

Special Departments, Clinical or Laboratory Facilities.—Those who are desirous of carrying out original research in Pathology, including Morbid Anatomy, Bacteriology, Experimental Pathology, and Chemical Pathology are admitted to work in the laboratories of the school by the Professor. A special course of instruction is given for preparation for the examinations for Diplomas in Public Health of the various universities and examining bodies; also special courses of Lectures and Demonstrations in Anæsthetics, Diseases of the Eye, Ear, Nose, and Throat, Skin, and Diseases of the Teeth, in Electrical and Radioscopic Diagnosis and Treatment, and in Clinical and Tropical Pathology. These courses are designed for senior students and graduates.

Appointments tenable by Students.—Clerkships and dresserships to the physicians, surgeons, anæsthetist, and pathologist are allotted amongst the students of the hospital. Maternity students are appointed each month and reside in the Students' House connected with the Medical School and Hospital. Eight house physicians and house surgeons, four senior and four junior obstetric assistants are selected annually by examination from among the senior students who have a medical qualification. The house physicians and house surgeons reside free in the hospital for six months, and the senior obstetric assistants for three months. In addition to these posts there are certain special appointments which are vacant from time to time and are filled by senior students of the hospital: 1. The Resident Medical Officer. This officer is appointed for a period of two years and is chosen from amongst the more senior recent residents of the hospital. 2. The Surgical Registrar is also chosen from among the more senior recent residents of the hospital. 3. The Obstetric Registrar. 4. A Casualty Medical Officer and a Casualty Surgical Officer are appointed, each for a period of six months. 5. Deputy Anæsthetists. During the absence of one or another of the Anæsthetists in the summer months a senior qualified student is appointed as a substitute and is granted a special certificate.

School Buildings and Equipment.—The new buildings for University College Hospital, completed by the generosity of the late Sir Blundell Maple, Bart., were opened by H.R.H. the Duke of Connaught on Tuesday, Nov. 6th, 1906. The new buildings for the Medical School, erected through the generosity of Sir Donald Currie, are now in occupation and contain accommodation for undergraduate and post-graduate students in all departments of medical study subsequent to the intermediate course.

Museum of Pathological Anatomy.—The Museum, a spacious and well-lighted room, is open for study from 8 A.M. to 5 P.M. The collection is divided into three sections—medical, surgical, obstetrical, and gynæcological. The surgical section is a particularly complete one and contains examples of every variety of surgical disease and injury. Diseases of the skin are well illustrated by a number of wax models which are conveniently displayed in glass cases. The obstetrical and gynæcological section is very complete. Microscopic sections of most of the specimens in the Museum have been prepared and are available for the use of students on application to the Curator. The Museum contains 1100 admirable paintings by Sir Robert Carswell and Sir Charles Bell and a collection of old surgical instruments formerly belonging to Robert Liston. It is also furnished with a small theatre, where separate demonstrations in each subject are given several times a week by members of the teaching staff.

The Anatomical Museum of the University of London, University College, is open to all students of University College Hospital and Medical School on the recommendation of the School Committee.

The Medical Library is open daily for the purposes of study to every student of the Medical School from 9 A.M to 5 P.M., Saturdays 9 A.M. to 1 P.M. It contains about 10,000 works on medical subjects, including all the current text-books and works of reference required for study or research.

The Medical Society of University College exists for the dual purpose (1) of promoting the study of Medical and Surgical Science, and (2) of promoting social intercourse among its members. All Students of the Medical School are eligible for membership. Meetings are held once a fortnight for the purpose of discussing subjects connected with the study of medicine and the allied sciences and for the exhibition of cases of pathological interest. One room in the Medical School is specially reserved as a Reading Room and is provided with current medical works and periodicals. The society also possesses an osteological and a pathological collection for the use of its members. In its social aspect the society includes various athletic clubs and has the management of three rooms on the ground floor of the Medical School, which are supplied with newspapers, magazines, writing materials, chess- and draught-boards, &c., solely for the use of its members. The society also superintends the commodious gymnasium of the Medical School. The Athletic Ground, which is used in conjunction with the Union Society of the University of London University College, is situated near the Great Western Railway station at Perivale and is within easy reach of the Hospital and School, about 25 minutes by train from Gower-street station. The following clubs are connected with the society: Cricket Club, Rugby Football Club, Association Football Club, Hockey Club, and Lawn-Tennis Club. The society also has the use of the College racquets and fives courts for its members. The affairs of the society are conducted by a committee elected annually by the members.

Residence of Students.—A register of boarding residences is kept in the office of the Medical School for the convenience of Students; these residences are not under the control of the school authorities. The Students' House in University-street contains large and comfortable rooms. The Maternity Students occupy them on payment of a moderate charge.

Private Instruction.—Gentlemen who desire assistance in their studies should consult the Dean, Professors, or Lecturers.

Hospital Staff.—Consulting Physicians: Sir W. R. Gowers, Dr. H. C. Bastian, Sir J. Williams, Bart., Dr. S. Ringer, and Dr. F. T. Roberts. Physicians: Sir Thomas Barlow, Bart., Dr. J. Rose Bradford, Dr. Sidney Martin, Dr. J. Risien Russell, and Dr. H. Batty Shaw. Assistant Physicians: Dr. F. J. Poynton and Dr. C. Bolton. Obstetric Physicians: Dr. H. R. Spencer and Dr. G. F. Blacker. Physician to Skin Department: Dr. H. Radcliffe Crocker. Consulting Surgeons: Sir John Tweedy (Ophthalmic) and Sir Victor Horsley. Surgeons: Mr. A. E. Barker, Mr. R. J. Godlee, Mr. Bilton Pollard, and Mr. Raymond Johnson. Assistant Surgeons: Mr. Rupert Bucknall and Mr. Wilfred Trotter. Ophthalmic Surgeon: Mr. Percy Flemming. Assistant Ophthalmic Surgeon: Mr. J. H. Parsons. Professor and Lecturer on Public Health: Dr. Henry R. Kenwood. Dental Surgeon: Mr. Sidney Spokes. Assistant Dental Surgeon: Mr. H. J. Relph. Anæsthetist: Dr. Dudley Buxton. Assistant Anæsthetists: Dr. H. J. Scharlieb and Mr. A. Beresford Kingsford. Surgical Registrar: Mr. O. L. Addison. Resident Medical Officer: Dr. A. M. H. Gray. Pathologist: Dr. F. H. Thiele. Electro-therapeutist: Mr. E. S. Worrall. Radiographer: Mr. R. H. Cooper. Pharmacist: Mr. R. R. Bennett.

Teaching Staff.—Medicine—The Principles and Practice of Medicine: Dr. J. Rose Bradford. Clinical Medicine: Sir Thomas Barlow, Dr. J. Rose Bradford, Dr. Sidney Martin, Dr. J. Risien Russell, Dr. H. Batty Shaw, Dr. F. J. Poynton, and Dr. C. Bolton. Therapeutics: Dr. H. Batty Shaw. Surgery—The Principles and Practice of Surgery: Mr. Arthur E. J. Barker. Clinical Surgery: Mr. Arthur E. J. Barker, Mr. Rickman J. Godlee, Mr. Bilton Pollard, Mr. Raymond Johnson, Mr. Rupert Bucknall, and Mr. Wilfred Trotter. Practical Surgery: Mr. Raymond Johnson and Mr. Wilfred Trotter. Surgical Anatomy: Mr. Wilfred Trotter. Midwifery and Gynæcology—Dr. H. R. Spencer. Clinical Midwifery and Gynæcology: Dr. H. R. Spencer and Dr. G. F. Blacker. Diseases of Childhood: Dr. H. Batty Shaw, Mr. Raymond Johnson, Mr. Percy Flemming, and Mr. Herbert Tilley. Pathology and Morbid Anatomy—General Pathology: Dr. Sidney Martin. Practical Pathology: Dr. D. N. Nabarro, Assistant Professor; and Dr. A. C. Stevenson, Assistant Bacteriologist. Laboratory and Special Instruction: Dr. Sidney Martin. Chemical Pathology and Clinical Pathology and Post-mortem Examination: Dr. F. H. Thiele. Museum of Pathological Anatomy: Mr. T. W. P. Lawrence, Curator. Forensic Medicine: Dr. J. S Risien Russell. Diseases of the Eye—Ophthalmic Medicine and Surgery: Mr. Percy Flemming. Clinical Ophthalmology: Mr. Percy Flemming and Mr. J. Herbert Parsons. Diseases of the Ear and Throat: Mr. Herbert Tilley. Diseases of the Skin: Dr. H. Radcliffe Crocker. Mental Physiology and Mental Diseases: Dr. W. Julius Mickle. Dental Surgery: Mr. Sidney Spokes and Mr. H. J. Relph. Instruction in the Use of Anæsthetics: Dr. Dudley W. Buxton. Electro-therapeutic Department: Mr. E. S. Worrall. Radiographic Department: Mr. R. Higham Cooper. Practical Pharmacy: Mr. R. R. Bennett.

WESTMINSTER HOSPITAL.—The hospital contains 215 beds and affords relief to upwards of 2000 in-patients and 30,000 out-patients annually. There are separate departments for Diseases of the Eye, Ear, Skin, Teeth, and Throat, for Orthopædics, and for Diseases of Women, and a special ward for children. The Anatomical, Pathological, and Materia Medica Museums are open to all students of the school.

A medical and a surgical registrar, each with a salary of £50, are appointed annually. Two house physicians, three house surgeons, and a resident obstetric assistant are appointed for six months after examination, and are provided with rooms and commons; also one assistant house physician and one assistant house surgeon with commons only. Clinical assistants to the assistant physicians and assistant surgeons, and to the officers in charge of special departments, are appointed from among qualified students of the hospital.

By a scheme for the concentration of the teaching of the preliminary and intermediate subjects of the curriculum, which has the support of the London University, an arrangement has been made by the Westminster school for the teaching of these subjects at King's College. Students, however, join the Westminster Medical School as formerly and the Entrance Scholarships remain as heretofore.

There is laboratory accommodation for practical work in Chemistry, Physics, Biology, Anatomy, Physiology, Histology, Pathology, and Bacteriology, and a new Clinical Laboratory has recently been erected. Facilities for research are afforded in all the laboratories.

For out-door recreation the following clubs exist: the Athletic Sports Club, the Cricket, Lawn Tennis, and Swimming Clubs, and the Rugby and Association Football Clubs. For in-door recreation there are the Students' Club and the Guthrie Society, the latter being a debating club. These clubs and societies together constitute the Clubs Union, for membership of which students are not required to pay, the expense being covered by the entrance fee to the school.

Staff.—Consulting Medical Staff: Dr. H. B. Donkin and Sir William H. Allchin. Consulting Surgical Staff: Mr. Richard Davy, Mr. G. Cowell, and Mr. N. C. Macnamara. Medical In-patient Staff: Dr. de Havilland Hall, Dr. W. Murrell, and Dr. R. G. Hebb. Obstetric Physician: Dr. W. Rivers Pollock. Surgical In-patient Staff: Mr. C. Stonham, Mr. W. G. Spencer, and Mr. A. H. Tubby. Medical Out-patient Staff: Dr. A. M. Gossage, Dr. Purves Stewart, and Dr. Eric Macnamara. *Physician for Diseases of the Skin*: Dr. T. Colcott Fox. Assistant Obstetric Physician: Dr. G. H. Drummond Robinson. Surgical Out-patient Staff: Mr. W. Turner, Mr. E. P. Paton, Mr. Arthur Evans, and Mr. Rock Carling. Surgeon in Charge of the Throat Department: Mr. P. R. W. De Santi. Ophthalmic Surgeon: Mr. G. Hartridge. Surgeon in charge of the Orthopædic Department: Mr. A. H. Tubby. Surgeon in charge of the Ear Department: Mr. P. R. W. De Santi. Dental Surgeons: Mr. C. W. Glassington and Mr. E. Gardner. Administrators of Anæsthetics: Dr. N. W. Bourns and Dr. V. B. Orr. Assistant Anæsthetist: Dr. Cecil Hughes. Physician Pathologist: Dr. R. G. Hebb. Assistant Pathologist and Curator of Museum: Dr. J. M. Bernstein. Medical Registrar: Dr. Price. Surgical Registrar: Mr. J. M. G. Swainson. Pharmacist: Mr. A. E. Tanner. Secretary: Mr. S. M. Quennell.

Lecturers.—Clinical Medicine: Dr. Hall, Dr. Murrell, and Dr. Hebb. Clinical Surgery: Mr. Stonham, Mr. Spencer, and Mr. Tubby. Clinical Gynæcology: Dr. Pollock (treasurer of the school). Medicine: Sir William H. Allchin, Dr. Murrell, Dr. Hebb, Dr. Gossage, Dr. Purves Stewart, Dr. Macnamara, and Dr. Duncan. Diseases of the Skin: Dr. Colcott Fox. Insanity: Dr. Robert Jones. Surgery: Mr. Spencer. Ophthalmic Surgery: Mr. Hartridge. Surgery of the Throat and Nose: Mr. De Santi. Orthopædic Surgery: Mr. Tubby. Aural Surgery: Mr. De Santi. *Dental Surgery*: Mr. Glassington. Anæsthetics: Dr. Bourns. Operative Surgery: Mr. Stonham. Surgical Anatomy: Mr. Arthur Evans. Practical Surgery: Mr. Turner and Mr. Rock Carling. Surgical Pathology: Mr. Paton (*Dean of the school*). Midwifery and Diseases of Women: Dr. Pollock. *General Pathology* and Morbid Anatomy: Dr. Hebb. Post-mortem Demonstrations: Dr. Hebb. Materia Medica, Therapeutics, and Pharmacology: Dr. *Dixon*. *Demonstrator of Practical* Pharmacy: Mr. A. E. Tanner. Forensic Medicine: Mr. Henslowe Wellington. Toxicology: *Dr. H. Wilson Hake*. Public Health: Dr. S. Monckton *Copeman*. *Bacteriology*: Dr. Bernstein. Anatomy: Dr. Thompson and Mr. Jenkins. Demonstrator of *Practical Anatomy*: Mr. Jenkins. Physiology: Dr. Halliburton. Practical Physiology *and Histology*: Dr. Halliburton, Dr. Lyle, Dr. Myers, *and* Dr. Rosenheim. Biology: Dr. Bottomley and Dr. Dendy. *Chemistry* and Practical Chemistry: Dr. Thomson, Mr. Jackson, and Mr. Kirkaldy. Physics: Dr. Harold A. Wilson, Mr. Allen, Mr. Nicol, and Dr. W. Wilson. Secretary and Librarian: Mr. W. Fryer.

LONDON (ROYAL FREE HOSPITAL) SCHOOL OF MEDICINE FOR WOMEN, 8, Hunter-street, *Brunswick*-square, W.C.—The fee for the medical course for the *University* of London, after the completion of the *Preliminary* Scientific year, is £135 in one *sum, or* £145 in four *instalments. The* fee for the Preliminary Science classes is £25. The fee for the course for the University of Durham, *the Society* of Apothecaries, and the Conjoint Colleges of Scotland, including Elementary Science, is £140 in one sum, or £150 in four *instalments.*

The hospital contains 165 beds, of which 78 are reserved for surgical, 64 for medical, 13 for gynæcological, six for ophthalmic, and four for isolation *cases*. The number of in-patients treated during the past year was 2474. There is also a department for attending women *in their* confinements at their own homes. Students can *also* attend the in-patient and out-patient practice of the New Hospital for Women.

Special classes for the Preliminary Scientific examination of the University of London are held and special courses of instruction in Anatomy, Physiology, and Practical Pharmacology are provided for students preparing for the Intermediate M.B. Examination of the University of London.

In addition to the list of Scholarships tabulated in another column three Evans Prizes of £3 3*s*., £2 2*s*., and £1 1*s*. are given in alternate years on the results of the class examination in midwifery, and two Durham Prizes, value £5 and £3, are given in alternate years on the results of the class examination in gynæcology, and a prize of £5 is awarded in alternate years on the results of the class examination in Midwifery and Gynæcology respectively. The Evans Prize for Operative Midwifery, value £5 5*s*., is *awarded yearly. Prizes of* £10 *each* are awarded yearly in Anatomy and Physiology. There is also a small fund from which assistance can occasionally be given to students and to graduates who specially require pecuniary help. Prizes and Certificates of Honour are awarded in each class at the end of the session.

Students after qualification can hold at the Royal Free Hospital the posts of house physician, house *surgeon*, clinical assistants, anæsthetist and assistant anæsthetists, medical and surgical registrars, medical electrician, and museum curator; and at the Medical School the posts of demonstrators in the departments of Anatomy, Physiology, Chemistry, and museum curator. They *can also* hold *posts* at the New Hospital for Women, which is officered entirely by medical *women*.

The School buildings have been entirely rebuilt in recent years and there are spacious, well-equipped laboratories, which afford every facility for efficiency of teaching and practical work in all departments.

There are residential chambers at 8, Hunter-street, with accommodation for 17 students, and the Secretary can be consulted on the subject of other residences for students. There is a Tennis Club with *a gravel court at the School, and* also hockey, *boating, and other clubs.*

Staff.—Consulting Physicians: Dr. S. West and Dr. T. Crawfurd Hayes. Physicians: Dr. Harrington Sainsbury, *Dr.* J. W. *Carr*, and *Dr.* A. G. Phear. Assistant Physicians: Dr. Farquhar Buzzard and Dr. W. P. S. Branson. Consulting Surgeons: Mr. W. Rose and Mr. A. B. Barrow. Surgeons: Mr. J. Berry, Mr. E. W. Roughton, *and* Mr. W. H. Evans. Assistant Surgeons: Mr. T. Percy Legg and Mr. Cunning. Physicians for Diseases of Women: Mrs. Scharlieb, M.S., M.D., and Mrs. Vaughan-Sawyer, M.S., M.D. Assistant Physician *for* Diseases of Women: Mrs. Willey, M.S., M.D. *Ophthalmic* Surgeon: Mr. H. Work Dodd. Surgeon for Diseases *of* Throat, Nose, and Ear: Mr. E. W. Roughton. Surgeon for Diseases of Skin: Mr. W. H. Evans. *Senior Resident* Medical Officer: Mr. A. D. Griffiths. Registrars: Miss Robert
M.D., B.S., and Miss Turnbull, M.D., B.S. Dentist: M
T. C. Budden. Anæsthetists: Mrs. Berry, M.D., B
and Mrs. Willey, M.S., M.D. Secretary: Mr. C.
Thies.

Lecturers.—At the School: Anatomy and Pr
Anatomy: Mr. Parsons. Physiology and Practical
logy: Dr. Brodie and Miss Cullis. Chemistry: M
B. Evans, D.Sc. Practical Chemistry: Miss Widd
Physics: Miss E. Stoney. Biology: Mr. Mudg

period of six months. 5. Deputy Anæsthetists. During the absence of one or another of the Anæsthetists in the summer months a senior qualified student is appointed as a substitute and is granted a special certificate.

School Buildings and Equipment.—The new buildings for University College Hospital, completed by the generosity of the late Sir Blundell Maple, Bart., were opened by H.R.H. the Duke of Connaught on Tuesday, Nov. 6th, 1906. The new buildings for the Medical School, erected through the generosity of Sir Donald Currie, are now in occupation and contain accommodation for undergraduate and post-graduate students in all departments of medical study subsequent to the intermediate course.

Museum of Pathological Anatomy.—The Museum, a spacious and well-lighted room, is open for study from 8 A.M. to 5 P.M. The collection is divided into three sections—medical, surgical, obstetrical, and gynæcological. The surgical section is a particularly complete one and contains examples of every variety of surgical disease and injury. Diseases of the skin are well illustrated by a number of wax models which are conveniently displayed in glass cases. The obstetrical and gynæcological section is very complete. Microscopic sections of most of the specimens in the Museum have been prepared and are available for the use of students on application to the Curator. The Museum contains 1100 admirable paintings by Sir Robert Carswell and Sir Charles Bell and a collection of old surgical instruments formerly belonging to Robert Liston. It is also furnished with a small theatre, where separate demonstrations in each subject are given several times a week by members of the teaching staff.

The Anatomical Museum of the University of London, University College, is open to all students of University College Hospital and Medical School on the recommendation of the School Committee.

The Medical Library is open daily for the purposes of study to every student of the Medical School from 9 A.M to 5 P.M., Saturdays 9 A.M. to 1 P.M. It contains about 10,000 works on medical subjects, including all the current text-books and works of reference required for study or research.

The Medical Society of University College exists for the dual purpose (1) of promoting the study of Medical and Surgical Science, and (2) of promoting social intercourse among its members. All Students of the Medical School are eligible for membership. Meetings are held once a fortnight for the purpose of discussing subjects connected with the study of medicine and the allied sciences and for the exhibition of cases of pathological interest. One room in the Medical School is specially reserved as a Reading Room and is provided with current medical works and periodicals. The society also possesses an osteological and a pathological collection for the use of its members. In its social aspect the society includes various athletic clubs and has the management of three rooms on the ground floor of the Medical School, which are supplied with newspapers, magazines, writing materials, chess- and draught-boards, &c., solely for the use of its members. The society also superintends the commodious gymnasium of the Medical School. The Athletic Ground, which is used in conjunction with the Union Society of the University of London University College, is situated near the Great Western Railway station at Perivale and is within easy reach of the Hospital and School, about 25 minutes by train from Gower-street station. The following clubs are connected with the society: Cricket Club, Rugby Football Club, Association Football Club, Hockey Club, and Lawn-Tennis Club. The society also has the use of the College racquets and fives courts for its members. The affairs of the society are conducted by a committee elected annually by the members.

Residence of Students.—A register of boarding residences is kept in the office of the Medical School for the convenience of Students; these residences are not under the control of the school authorities. The Students' House in University-street contains large and comfortable rooms. The Maternity Students occupy them on payment of a moderate charge.

Private Instruction.—Gentlemen who desire assistance in their studies should consult the Dean, Professors, or Lecturers.

Hospital Staff.—Consulting Physicians: Sir W. R. Gowers, Dr. H. C. Bastian, Sir J. Williams, Bart., Dr. S. Ringer, and Dr. F. T. Roberts. Physicians: Sir Thomas Barlow, Bart., Dr. J. Rose Bradford, Dr. Sidney Martin, Dr. J. Risien Russell, and Dr. H. Batty Shaw. Assistant Physicians: Dr. F. J. Poynton and Dr. C. Bolton. Obstetric Physicians: Dr. H. R. Spencer and Dr. G. F. Blacker. Physician to Skin Department: Dr. H. Radcliffe Crocker. Consulting Surgeons: Sir John Tweedy (Ophthalmic) and Sir Victor Horsley. Surgeons: Mr. A. E. Barker, Mr. R. J. Godlee, Mr. Bilton Pollard, and Mr. Raymond Johnson. Assistant Surgeons: Mr. Rupert Bucknall and Mr. Wilfred Trotter. Ophthalmic Surgeon: Mr. Percy Flemming. Assistant Ophthalmic Surgeon: Mr. J. H. Parsons. Professor and Lecturer on Public Health: Dr. Henry R. Kenwood. Dental Surgeon: Mr. Sidney Spokes. Assistant Dental Surgeon: Mr. H. J. Relph. Anæsthetist: Dr. Dudley Buxton. Assistant Anæsthetists: Dr. H. J. Scharlieb and Mr. A. Beresford Kingsford. Surgical Registrar: Mr. O. L. Addison. Resident Medical Officer: Dr. A. M. H. Gray. Pathologist: Dr. F. H. Thiele. Electro-therapeutist: Mr. E. S. Worrall. Radiographer: Mr. R. H. Cooper. Pharmacist: Mr. R. R. Bennett.

Teaching Staff.—Medicine—The Principles and Practice of Medicine: Dr. J. Rose Bradford. Clinical Medicine: Sir Thomas Barlow, Dr. J. Rose Bradford, Dr. Sidney Martin, Dr. J. Risien Russell, Dr. H. Batty Shaw, Dr. F. J. Poynton, and Dr. C. Bolton. Therapeutics: Dr. H. Batty Shaw. Surgery—The Principles and Practice of Surgery: Mr. Arthur E. J. Barker. Clinical Surgery: Mr. Arthur E. J. Barker, Mr. Rickman J. Godlee, Mr. Bilton Pollard, Mr. Raymond Johnson, Mr. Rupert Bucknall, and Mr. Wilfred Trotter. Practical Surgery: Mr. Raymond Johnson and Mr. Wilfred Trotter. Surgical Anatomy: Mr. Wilfred Trotter. Midwifery and Gynæcology—Dr. H. R. Spencer. Clinical Midwifery and Gynæcology: Dr. H. R. Spencer and Dr. G. F. Blacker. Diseases of Childhood: Dr. H. Batty Shaw, Mr. Raymond Johnson, Mr. Percy Flemming, and Mr. Herbert Tilley. Pathology and Morbid Anatomy—General Pathology: Dr. Sidney Martin. Practical Pathology: Dr. D. N. Nabarro, Assistant Professor; and Dr. A. C. Stevenson, Assistant Bacteriologist. Laboratory and Special Instruction: Dr. Sidney Martin. Chemical Pathology and Clinical Pathology and Post-mortem Examination: Dr. F. H. Thiele. Museum of Pathological Anatomy: Mr. T. W. P. Lawrence, Curator. Forensic Medicine: Dr. J. S Risien Russell. Diseases of the Eye—Ophthalmic Medicine and Surgery: Mr. Percy Flemming. Clinical Ophthalmology: Mr. Percy Flemming and Mr. J. Herbert Parsons. Diseases of the Ear and Throat: Mr. Herbert Tilley. Diseases of the Skin: Dr. H. Radcliffe Crocker. Mental Physiology and Mental Diseases: Dr. W. Julius Mickle. Dental Surgery: Mr. Sidney Spokes and Mr. H. J. Relph. Instruction in the Use of Anæsthetics: Dr. Dudley W. Buxton. Electro-therapeutic Department: Mr. E. S. Worrall. Radiographic Department: Mr. R. Higham Cooper. Practical Pharmacy: Mr. R. R Bennett.

WESTMINSTER HOSPITAL.—The hospital contains 215 beds and affords relief to upwards of 2000 in-patients and 30,000 out-patients annually. There are separate departments for Diseases of the Eye, Ear, Skin, Teeth, and Throat, for Orthopædics, and for Diseases of Women, and a special ward for children. The Anatomical, Pathological, and Materia Medica Museums are open to all students of the school.

A medical and a surgical registrar, each with a salary of £50, are appointed annually. Two house physicians, three house surgeons, and a resident obstetric assistant are appointed for six months after examination, and are provided with rooms and commons; also one assistant house physician and one assistant house surgeon with commons only. Clinical assistants to the assistant physicians and assistant surgeons, and to the officers in charge of special departments, are appointed from among qualified students of the hospital.

By a scheme for the concentration of the teaching of the preliminary and intermediate subjects of the curriculum, which has the support of the London University, an arrangement has been made by the Westminster school for the teaching of these subjects at King's College. Students, however, join the Westminster Medical School as formerly and the Entrance Scholarships remain as heretofore.

There is laboratory accommodation for practical work in Chemistry, Physics, Biology, Anatomy, Physiology, Histology, Pathology, and Bacteriology, and a new Clinical Laboratory has recently been erected. Facilities for research are afforded in all the laboratories.

S. Wallace or to W. M. Wilcox, the Secretary, at the hospital. Physicians: Dr. Eustace Smith, Dr. J. A. Coutts, Dr. Morley Fletcher, Dr. E. Graham Little, and Dr. A. M. Gossage. Surgeons: Mr. *Cathbert S. Wallace and* Mr. W. Trotter. Assistant Physicians: Dr. Clive Riviere, Dr. W. P. S. Branson, and Dr. T. Fisher. Assistant Surgeons: Mr. W. H. Bowen and Mr. R. Warren. Ophthalmic Surgeon: Mr. W. I. Hancock. Dental Surgeon: Mr. E. S. Pierrepont. *Medical Officer* for the Electrical Department: Dr. H. Manders. Medical Officer for the Casualty Department: Dr. W. Wells. Resident Medical Officer: Dr. W. N. May. House Physician: Mr. H. Moyle. House Surgeon: M. D. L. Morrison. Secretary: W. M. Wilcox.

THE HOSPITAL FOR SICK CHILDREN, Great Ormond-street, W.C., contains 222 beds, divided into 95 medical, 105 surgical, and 22 for special and infections cases, besides 38 beds at the convalescent branch, Highgate. The hospital having been recognised by the Conjoint Board for England as a place where, under the new curriculum, six months of the fifth year may be spent in clinical work, the practice is arranged to meet this need and is open to students who have completed four years of medical study and also to qualified medical men. The medical staff are recognised by the University of London as teachers in Diseases of Children. Appointments are made every three months to six medical clerkships, which are open to students of the hospital. Lectures or demonstrations are given once every week during both winter and summer sessions, which qualified practitioners are invited to attend free of charge. There is a museum in connexion with the hospital. The sessions are of ten weeks' *duration, and begin* in October, January, and March. Fees for hospital practice, three months, 3 guineas; perpetual ticket, 5 guineas. Clinical Clerks, £1 1*s*. for three months. Consulting Physicians: Dr. W. H. Dickinson, Dr. W. B. Cheadle, Sir Thomas Barlow, Bart., Dr. D. B. Lees, *and Dr. F. G.* Penrose. Physicians: Dr. A. E. Garrod, Dr. A. F. Voelcker, Dr. W. S. Colman, and Dr. F. E. *Batten. Physicians to* Out-patients: Dr. G. F. Still, Dr. F. J. Poynton, Dr. Robert Hutchison, Dr. H. Thursfield, and Dr. T. Thompson. Consulting Surgeons: Sir Thomas Smith, Bart., Mr. Howard Marsh, Mr. Edmund Owen, Mr. John H. Morgan, C.V.O., and Mr. Bernard Pitts. Surgeons: Mr. W. Arbuthnot Lane, Mr. Thomas H. Kellock, and Mr. H. Stansfield Collier, Surgeons to Out-patients: Mr. Edred M. Corner, Mr. G. E. Waugh, Mr. H. A. T. Fairbank, and *Mr. O. L. Addison.* Ophthalmic Surgeon: Mr. J. Herbert Parsons. Aural Surgeon: Mr. G. E. Waugh. Dental Surgeon: Mr. W. Warwick James. Honorary Anæsthetist: Dr. R. W. Collum. Radiographer: Dr. Ironside Bruce. Local Medical Officer for Cromwell House: Dr. A. M. Henderson. Medical Registrar: Dr. Miller. Clinical Pathologist and Bacteriologist: Mr. Graham Forbes. Anæsthetists: Mr. Graham Scott, Mr. E. E. Argles, and Mr. H. S. Sington. Resident Medical Superintendent: Mr. H. T. Gray. Secretary: Mr. Stewart Johnston.

EVELINA HOSPITAL FOR *SICK CHILDREN*, Southwark-bridge-road, S.E.—This hospital contains 76 cots and a very extensive Out-patient *Department. About* ten clinical assistants, to work with the Honorary Medical Staff for Out-patients, are appointed quarterly for a period of *three months; there is* no salary attached to these posts; but, on the other hand, no fees are charged. Consulting Physicians: Dr. J. F. *Goodhart, Dr.* Frederick Taylor, and Dr. Nestor Tirard. Physicians: Dr. J. Charlton Briscoe and Dr. T. R. Whipham. Physicians in charge of Out-patients: Dr. D. Forsyth and Dr. H. C. Mann. Physician in charge of Skin Department: Dr. S. Ernest Dore. Consulting Surgeons: Sir H. G. Howse, Mr. R. Clement Lucas, Mr. G. H. Makins, Mr. F. S. Eve, Mr. F. C. Abbott, Mr. A. H. Tubby, and Mr. C. H. Fagge. Surgeons: Mr. H. S. Clogg and Mr. W. M. Mollison. Surgeons in charge of Out-Patients: Mr. C. A. R. Nitch and Mr. P. Maynard Heath. Dental Surgeon: Mr. Denison Pedley. Ophthalmic Surgeon: Mr. Sydney Stephenson. Aural Surgeon: Mr. S. R. Scott. House *Physician*: Mr. E. Parry Evans. House Surgeon: Mr. A. W. Hayward. House-Physician: (No. 2) (vacant). Pathologist: Dr. A. N. Leathem. Anæsthetist: Mr. F. D. S. Jackson. Radiographer: Mr. R. H. Cooper. Secretary: H. C. Stanilard Smith.

VICTORIA HOSPITAL FOR CHILDREN, Chelsea, S.W.—The hospital contains 104 beds and has a large out-patient department (over 1200 weekly); the home at Broadstairs has 50 beds. Consulting Physicians: Sir Francis Laking, Sir Wm. Henry Allchin, and Dr. Ridge Jones. Consulting Surgeons: Mr. Cowell, Mr. Pickering Pick, and Mr. D'Arcy *Power. Physicians: Dr. Walter Carr, Dr. Humphry D.* Rolleston, Dr. Edmund Ivens Spriggs, Dr. A. J. Jex-Blake, Dr. Charles Miller, and Dr. Reginald Jewesbury. Physician to Skin Department: Dr. J. M. H. MacLeod. Surgeons: Mr. H. F. Waterhouse, Mr. Joseph Cunning, and Mr. Fedde Fedden. Surgeons to the Out-patients: Mr. S. Maynard Smith, Mr. Ralph Thompson, and Mr. Harold W. Wilson. Ophthalmic Surgeon: Mr. C. Devereux Marshall. Dental Surgeon: Mr. C. E. Wallis. Anæsthetists: Dr. Randolph Grosvenor, Dr. F. E. Shipway, and Dr. C. G. H. Gunning. Resident Medical Officer: Mr. Eric Harries. House Surgeon: Mr. W. O. Pitt. House Physician: Mr. Robert Lakin. Secretary: Mr. H. G. Evered. Out-patients are seen as under:—Diseases of the Eye: Wednesday, 2 P.M. Diseases of the Skin: Wednesday, 2 P.M. Whooping-cough Cases: Fridays, 9.30 A.M. Medical and Surgical Cases: Monday and Thursday mornings at 9 A.M.; any afternoon except Wednesday and Saturday at 12.30 P.M. Dental Cases: Wednesday mornings at 9.30 A.M. Accidents and urgent cases are admitted at any time.

THE QUEEN'S HOSPITAL FOR CHILDREN (*late North-Eastern Hospital for Children*), Hackney-road, Bethnal Green, E. (Telephone 305 Dalston). For the sick children of the poor under 12 years of age. Established 1867.—130 beds. During the past year 1482 in-patients and 26,525 out-patients (representing 70,924 attendances and including 11,583 casualty cases) were relieved, 536 of the in-patients being under two *years of age. Consulting Physicians*: Dr. W. Cayley, Dr. W. Pasteur, and Dr. W. A. Wills. Consulting Surgeons: Mr. Jonathan Hutchinson, Mr. *Waren Tay, Mr. R.* J. Godlee, Mr. Bilton Pollard, and Mr. H. Percy Dean. Physicians: Dr. James Taylor, Dr. J. Porter Parkinson, and Dr. George Carpenter. Assistant Physicians: Dr. Charles Bolton, Dr. Sheffield Neave, and Dr. R. A. Chisolm. *Surgeons:* Mr. Douglas Drew and Mr. Ewen C. Stabb. *Assistant* Surgeons: Mr. P. Lockhart Mummery and Mr. J. M. G. Swainson. Ophthalmic Surgeon: Mr. Sydney Stephenson (Thursday, 2.30 P.M.). Physician in charge of Skin Department: Dr. J. L. Bunch. Dental Surgeon: Mr. S. F. Rose (Tuesday, 9.30 A.M., and Friday, 2.30 P.M.). Medical Radiographer: Mr. Percival Dingle. Pathologist and Bacteriologist: (vacant). Resident Medical Officer: Dr. E. Bellingham Smith. Three other resident medical men (appointed half-yearly)—viz., House *Physician and two* House Surgeons. Matron: Miss Bushby. Secretary: Mr. T. Glenton-Kerr. The surgeons attend *on* Wednesdays at 2 P.M. and Fridays and Saturdays at 9.30 A.M.; the *physicians daily at* 2 P.M., except Saturday, 9.30 A.M. Applications for permission to attend the practice of the hospital should be *addressed to the secretary.*

ROYAL LONDON OPHTHALMIC HOSPITAL (*Moorfields*, 1804–1899), City-road, E.C.—138 beds. This hospital, *known as Moorfields Eye Hospital*, was moved in *1899 to* larger buildings in City-road. In 1907 there were 2218 in-patients, the new out-patients were 49,776, *and the attendances* were 124,304. Operations are performed daily from 10 A.M. to 1 P.M. and four surgeons attend on each day. *Students are admitted* to the practice of the hospital. Fee for six months, £3 3*s*.; perpetual, £5 5*s*. Courses of instruction on the *following subjects are* given at the hospital periodically: (1) examination of the eye; (2) the use of the ophthalmoscope; (3) *errors* of refraction; (4) external diseases of the eye; (5) surgical anatomy of *the eye*; (6) motor anomalies; (7) pathology of the eye; (8) practical pathology; (9) bacteriology; (10) operative surgery; (11) x ray work; and (12) clinical lectures. A composition fee of £10 10*s*. will entitle students of the hospital to a perpetual ticket and will admit them once to all the above lectures and demonstrations except the classes on practical pathology, bacteriology, operative surgery, and x ray work. Students of the hospital are eligible for the offices of house surgeon or clinical and junior assistants. Junior assistants are appointed every three

CITY OF LONDON HOSPITAL FOR DISEASES OF THE CHEST, Victoria Park.—*During the past year 1212 in-patients* have been treated in the wards, and the large number of 40,137 cases since the opening of the wards in 1855. The number of out-patients treated during 1907 was 15,948 and 737,978 since the commencement of the institution in 1848. *Information as to medical instruction can be obtained on* application to the Secretary of the Clinical Sub-committee at the hospital. Consulting Physicians: Dr. J. C. Thorowgood, Dr. Eustace Smith, Dr. Vincent D. Harris, Sir William S. Church, Dr. E. Clifford Beale, and Dr. Harrington Sainsbury. Consulting Surgeon: Lord Lister. Physicians: Dr. G. A. Heron, Dr. T. Glover Lyon, Sir Hugh Beevor, Bart., Dr. W. J. Hadley, Dr. E. H. Colbeck, and Dr. Arnold Chaplin. Surgeon: Mr. G. Lenthal Cheatle. Physicians to Out-patients: Dr. Hugh Walsham, Dr. Oliver K. Williamson, Dr. Clive Riviere, Dr. O. F. F. Grünbaum, Dr. T. Lewis, and Dr. Eric Pritchard. Surgeon Dentist: Mr. Evelyn C. Sprawson. Secretary: H. Dudley Ryder. Secretary *of the Medical Committee:* Dr. O. F. F. Grünbaum.

ROYAL HOSPITAL FOR DISEASES OF THE CHEST, City-road. (80 beds.)—This hospital provides accommodation for 80 in-patients. Expenditure for 1907 £6296; income (including legacies, £3075) £7655. The attendance of out-patients averages 27,000 annually. Consulting Physicians: Dr. Horace Dobell, Dr. P. J. Hensley, and Professor D. W. Finlay. *Physicians: Dr. W. H. White, Dr. A. Davies, Dr.* J. Calvert, Dr. M. Leslie, Dr. J. H. Drysdale, and Dr. A. G. Phear. Assistant Physicians: Dr. H. E. Symes Thompson, Dr. J. Graham Forbes, and Dr. Bernard Hudson. Consulting Surgeons: Mr. J. Hutchinson and Mr. Pearce Gould. Surgeon: Mr. W. Turner. Radiographer: Dr. A. C. Jordan. Resident Medical Officer: Dr. A. S. Hosford. House Physician: vacant. Secretary: Mr. A. T. Mays.

THE MOUNT VERNON HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST, HAMPSTEAD AND NORTHWOOD, CENTRAL OUT-PATIENT DEPARTMENT, Fitzroy-square, W.—The Hospitals contain 220 beds. Number of in-patients, 1424; out-patients, 3002. *Resident Medical Staff. Lectures* and Clinical Demonstrations are given by the Visiting Medical Staff at the Hospital at Hampstead and the Out-patient department. The next course begins in October, at the out-patient department. Clinical assistants are appointed to physicians in the wards, and in the out-patient department. Consulting Physicians: Sir Hermann Weber and Sir T. Clifford Allbutt, K.C.B. Consulting Surgeon: Sir W. Watson Cheyne, Bart. Physicians: Dr. J. Edward Squire, C.B., Dr. F. W. Tunnicliffe, Dr. George Johnston, Dr. F. Parkes Weber, Dr. T. N. Kelynack, and Dr. T. D. Lister. Assistant Physicians: Dr. F. W. Price and Dr. A. J. Whiting. Pathologist: Dr. F. W. Price. Surgeon: Mr. James Berry. Laryngologist: Mr. Harold Barwell. Anæsthetist: Dr. Herbert Scharlieb, C.M.G., Dental Surgeon: Mr. H. C. Colyer.

QUEEN CHARLOTTE'S LYING-IN HOSPITAL AND MIDWIFERY TRAINING SCHOOL, Marylebone-road, N.W.—This hospital, which has been recently again enlarged and in which many important improvements have been carried out, receives over 1700 patients annually, besides having a large out-patient department. Medical pupils are received at all times of the year. Pupils have unusual opportunities of seeing obstetric complications and operative midwifery, on account of the very large number of primiparous cases—nearly three-fourths of the total admissions. Clinical instruction is given on the more important cases which present themselves. Certificates of attendance at this hospital are recognised by all the Universities, Colleges, and licensing bodies. Pupil midwives and monthly nurses are received and specially trained. Fees: Medical Students, £8 8s. for four weeks; Qualified Medical Practitioners, *£8 8s. for four weeks. Pupil Midwives* (including board and lodging), £35 for five months; Pupil Nurses (including board and lodging), £24 for sixteen weeks. The new Residential College provides accommodation for 16 men at a time, students and qualified practitioners, and is opposite the hospital, with which *it is in telephonic* communication. Terms for residence and full board 35s. per week. For further particulars application should be made to Mr. *Arthur Watts*, Secretary, at the hospital. Students join preferably on the first Monday in each month. Arrangements have been made whereby 14 Medical Students can now be admitted per month (168 per annum) to the practice of the hospital in order to receive[2] preliminary *instruction in Practical. Midwifery* in accordance with the *recommendations of the General Medical Council.* This instruction will include: (1) Practical instruction in the methods of examination of pregnant women; (2) delivery of women in labour under the *direct supervision* of a Medical Officer of the hospital; *(3) practical instruction* in the treatment of the mother and child during the puerperium, including clinics held four times weekly by the Visiting Medical Staff; and (4) instruction in the Clinical Laboratory of the hospital. Students will be accommodated at the Residential College adjoining the hospital. The inclusive fee for hospital practice and board and lodging will be £12 12s. per calendar month. *Medical students and qualified practitioners will still be* admitted under the old regulations for a month's course. During this time they will be able to attend the number of cases of labour required by the various examining bodies. The inclusive fee for this course and for board and lodging will be £15 8s. Consulting Physicians: Dr. George B. Brodie and Dr. W. S. A. Griffith. Consulting Surgeon: Mr. *Alfred* Willett. *Physicians to In-patients: Dr.* W. Rivers Pollock, Dr. W. J. Gow, Dr. T. W. Eden, and Dr. A. F. Stabb. Physicians to Out-patients: Dr. C. Hubert Roberts and Dr. Thomas G. Stevens.

THE HOSPITAL FOR WOMEN, Soho-square, W.—In connexion with the out-patient department there has been for some years a well-organised Clinical Department. Gentlemen are appointed to act as clinical assistants to the gynæcologists to out-patients. The appointments are open to qualified medical men and women. They are entitled to receive notice of all operations performed within the hospital, and every facility is afforded them by the gynæcologists in the out-patient department of obtaining experience in diagnosis and treatment and the practical use of instruments. Fee for one month £2 2s.; for each subsequent month the same. The *hospital contains 60 beds. In the out-patient* department there were over *4000 new cases during the past* year, the total number of out-patient attendances being 16,338. This large number affords *exceptional* opportunities for examining and studying most of the varieties of the diseases of women. Applications should be made to the Dean. Consulting Physicians: Dr. C. H. Carter and Dr. E. Holland. Consulting Surgeon: Mr. H. A. Reeves. Consulting Surgeon Dentist: Mr. Cauton. Gynæcologists: Dr. Richard Smith, *Dr. J. A. Mansell-Moullin, Dr. Bedford Fenwick (in charge of out-patients), Dr. James Oliver, Dr. J. H.* Dauber, and Dr. A. E Stevens. Assistant Gynæcologist: Dr. H. J. F. Simson. Surgeon: Mr. D. Drew. Assistant Surgeon: Mr. L. H. McGavin. Surgeon Dentist: Mr. C. G. May. Anæsthetists: Mr. C. J. Ogle and Dr. M. Horne. Pathologist: Dr. S. J. Aarons. Registrar, Dr. W. A. Milligan. House Physician: Dr. Mackenzie.

EAST LONDON HOSPITAL FOR CHILDREN AND DISPENSARY FOR WOMEN, Glamis-road, Shadwell, E.—The hospital maintains 120 cots, and on an average 259 *out-patients are seen daily. Clinical instruction is given* by the physicians and surgeons to the hospital, which is recognised by the Conjoint Board for England as a school of medical teaching for students in the fifth year of the curriculum. All particulars may be obtained on application to the Secretary. Two clinical clerkships for qualified or unqualified students are open every three months, subject to reappointment if desired. Clinical assistants (qualified men only) are from time to time appointed in the out-patient department. Any additional *information may be obtained* on applying to Mr. Cuthbert

---

[2] The preliminary instruction which is now required by the General Medical Council is preparatory to the attendance on 20 cases of labour which is still *required in addition to* the above course.

Leicester-square. The opening lecture on Cataphoresis in General and Special Medicine will be given by Dr. Morgan Dockrell on Oct. 8th. At the end of the course the Chesterfield silver medal may be competed for by those who have attended three-fourths of the lectures. Physicians: Dr. Morgan Dockrell, Dr. M. K. Hargreaves, Dr. Thomas D. Savill, Dr. Alfred Eddowes, and Dr. G. W. Dawson. Assistant Physicians: Dr. Agnes F. Savill, Dr. V. H. Rutherford, and Dr. Louis F. Knuthsen. Medical Officer to X-ray Department: Mr. Chisholm Williams.

LONDON LOCK HOSPITAL AND RESCUE HOME.—This institution consists of a hospital for females in the Harrow-road and a hospital for males in Dean-street, Soho. At the latter branch an out-patient department is attached and both sexes receive treatment. In the female branch there are 120 beds and 461 patients were admitted in 1907. In the male branch there are 27 beds which during 1907 accommodated 235 patients. Over 34,000 out-patients were treated. Patients are seen at Dean-street on Mondays from 1 to 2 P.M. and from 6 to 8 P.M.; on Tuesdays and Wednesdays from 6 to 8 P.M.; on Fridays from 2 to 3 P.M. (female patients); and on Saturdays from 2 to 4 P.M. Consulting Surgeons: Mr. Buxton Shillitoe and Mr. J. A. Bloxam. Consulting Ophthalmic Surgeon: Mr. Henry Edward Juler. Physician: Dr. Sidney Phillips. Surgeons: Mr. J. Ernest Lane, Mr. Arthur Shillitoe, and Mr. Charles Gibbs. Surgeons to Out-patients: Mr. Charles Ryall, Mr. Herbert J. Paterson and Mr. Ernest C. Hughes. House Surgeon at the Female Hospital: Mr. J. Johnston Abraham. House Surgeon at the Male Hospital and Out-patients' Department: Mr. H. S. Pinker.

3RD COUNTY OF LONDON FIELD AMBULANCE, 1ST LONDON DIVISION, 51, Calthorpe-street, Gray's Inn-road, W.C.—Officer Commanding: Lieutenant-Colonel J. Harper. The 3rd County of London Field Ambulance, 1st London Division bears the same relation to the Territorial Army as the Royal Army Medical Corps bears to the regular Army. The course of training has the great advantage of affording, in addition to a knowledge of ordinary military duties, special ambulance instruction useful in all ranks of life. All students who are thinking of entering either of the public services are strongly recommended to join. The instruction received will be found of the greatest advantage to such as intend joining either the Royal Army Medical Corps or the Indian Medical Service on the completion of their hospital course, the work taught in this Field Ambulance being practically the same as that taught at the Depôt, Royal Army Medical Corps, Aldershot, and in which an examination is held at the end of the four months' course there before the young officers are drafted to their different stations. A sound knowledge of the work which can be obtained in the Field Ambulance must necessarily be of great benefit to those going through the depôt and give a decided advantage over those who have had no previous military training. In addition to the drills of an ordinary infantry corps, the special training includes stretcher and wagon and cacolet drill; the use of improvised seats and stretchers; the use and application of bandages, splints, &c.; the duties of the *personnel* of a field ambulance; lectures by the officers on first aid to the injured, and on the elements of anatomy, physiology, hygiene, and nursing, which are so arranged as not to interfere with the lectures, &c., carried on at the various hospitals in London. The Ambulance goes into camp for eight to 15 days in the summer each year for field training with its brigade or division. There is also a Shooting Club in the corps, in which instruction in, and facilities for, the practice of rifle shooting are given. There is a Transport Section in connexion with the corps, the members of which go through a course of instruction in riding and driving and transport work with the regular troops. There are also sections of Cyclists and Signallers. A Gymnastic and Boxing Class meets once a week at headquarters, under a professional instructor. Lectures are delivered during the winter session. The Sergeant Major will give any information respecting the above on application to the headquarters, 51, Calthorpe-street, Gray's Inn-road, W.C.

COOKE'S SCHOOL OF ANATOMY, PHYSIOLOGY, AND OPERATIVE SURGERY, *London.*—The school is prepared to admit to its supplementary work all who may wish to join the same, but in regard to its curriculum work it does not receive more than half-a-dozen students in the course of the year; these have special advantages both as regards Anatomy and Physiology. Charges are but slightly in excess of current charges and particulars are forwarded on application. By the decision of various examining bodies gentlemen rejected at their Anatomical and Physiological Examinations can get signed up for the supplementary work they are required to put in before re-examination. The operations of surgery are performed on the dead body and the courses are recognised for army promotion. The school possesses a good collection of physiological and chemical apparatus and candidates for the higher examinations receive special instruction in the more difficult subjects.

PROVINCIAL MEDICAL SCHOOLS AND HOSPITALS HAVING SPECIAL CLASSES AND FACILITIES FOR CLINICAL STUDY.[1]

THE number of important provincial medical schools has much grown of late in England mainly owing to the foundation of the new provincial universities. The faculty of medicine of these universities is able to arrange a full medical curriculum for students with access to the different hospitals, large and small, of the university city, and the students at these schools will receive at the end of their medical course a degree in medicine. We have already described the academic procedure to obtain the degrees; we now enumerate the hospitals at which the students of the medical schools of the universities can complete their medical education.

UNIVERSITY OF OXFORD: RADCLIFFE INFIRMARY AND COUNTY HOSPITAL.—Courses of instruction are given in connexion with the Oxford University Medical School. These include (1) a course in Practical Medicine by the Regius Professor of Medicine; (2) Clinical lectures by the Litchfield Lecturers in Medicine and Surgery; and (3) tutorial instruction and demonstrations in special Regional Anatomy (medical and surgical), methods of Medical and Surgical Diagnosis, and Surgical Manipulation. Pathological demonstrations are given in the post-mortem room at the Pathological Laboratory by the Professor of Pathology. Practical Pharmacy is taught in the Radcliffe Dispensary. Opportunities are offered to students who wish to act as surgical dressers and clinical clerks in the out patient departments and in the wards. The Infirmary contains 150 beds. Honorary Physician: Dr. E. B. Gray. Honorary Surgeons: Mr. J. Briscoe and Mr. A. Winkfield. Active Consulting Physician: Professor William Osler. Acting Staff:—Honorary Physicians: Dr. W. Tyrrell Brooks, Dr. W. Collier, and Dr. E. Marlam. Honorary Assistant Physician and Medical Registrar: Dr. A. Waters. Honorary Surgeons: Mr. Horatio P. Symonds, Mr. R. H. A. Whitelocke, and Mr. A. P. Parker. Honorary Assistant Surgeon and Surgical Registrar: Mr. E. C. Bevers. Consulting Ophthalmic Surgeon: Mr. R. W. Doyne. Pathologist: Professor Georges Dreyer. Consulting Dental Surgeon: Mr. E. A. Bevers. Honorary Radiographer: Dr. R. H. Sankey. House Physician: Dr. W. Hal Barnett. House Surgeon: Mr. H. R. Ramsbotham. Junior House Surgeon: Mr. G. Moore Johnson.

UNIVERSITY OF CAMBRIDGE: ADDENBROOKE'S HOSPITAL.—Clinical Lectures in Medicine and Surgery, in connexion with Cambridge University Medical School, are delivered at this hospital twice a week during the academical year; and practical instruction in Medicine and Surgery in the wards and out-patients' rooms is given by the physicians and surgeons daily, during the vacations as well as term time. Instruction is also given in the special methods of medical and surgical investigation. Clinical Clerks and Dressers are selected from students according to merit. The composition fee for pupilship is 8 guineas. Consulting Physician: Dr. P. W. Latham and Dr. D. MacAlister. Consulting Surgeon: Mr. G. Wallis. Physicians: Sir T. C. Allbutt, Dr. J. B. Bradbury, and Dr. L. Humphry. Assistant Physicians: Dr E. Lloyd-Jones and Dr J. A. Wright. Surgeons: Mr. G. Wallis, Mr. G. E. Wherry, Mr. F. Deighton, Mr. J. Griffiths, and Mr. F. H. Marsh. Assistant Surgeon: Mr. Cooke. Consulting Dental Surgeon: Mr. W. A. Rhodes.

---

[1] For Scholarships see p. 664 et seq.

Assistant Surgeons: Mr. J. H. Parsons and Mr. C. Worth. Medical Officer to the X Ray Department: Mr. J. M. Davidson. Curator and Librarian: Mr. G. Coats. Bacteriologist: Dr. B. H. Wedd. Senior House Surgeon: Mr. A. C. Hudson. *Second House Surgeon: Mr. Norman E. Gibbs.* Third House Surgeon: Mr. J. Stevenson Wilson. Refraction Assistants: Mr. T. Phillips, Mrs. Warner, Mr. G. T. Mould, and Miss S. Seekings.

ROYAL WESTMINSTER OPHTHALMIC HOSPITAL, King William-street, West Strand.—The hospital *contains 40 free* beds. Patients, who number over 11,000 annually, are seen at 1 P.M., and operations performed daily at 2 P.M. The following are the days of attendance of the surgeons: Mr. Hartridge and Mr. Grimsdale, Mondays and Thursdays; Mr. Roll and Mr. McMullen, Tuesdays and Fridays; and Mr. Dodd and Mr. Brewerton, Wednesdays and Saturdays. The practice of the hospital is open to practitioners and *students. Fees for six months, £3 3s.*; perpetual, £5 5s. Students of the hospital are eligible for the posts of house surgeon and clinical assistants. Special demonstrations and lectures will be given during the session, commencing early in October; for details see weekly journals. Clinical Assistants *(who must be duly qualified) to the Surgeons are* appointed for periods of six months. Secretary: Mr. John Hy. Johnson.

ROYAL EYE HOSPITAL, St. George's-circus, Southwark, S.E.—There are 40 beds and 2 cots. There were 84,108 attendances in the Out-patient Department last year and the new patients numbered 28,144. Operations are performed and out-patients are seen daily at 9 A.M. and 2 P.M. *The following are the days of attendance*:—Afternoons: Mr. M. M. McHardy, Tuesdays and Thursdays; Sir William J. Collins, Mondays and Wednesdays; Mr. L. V. Cargill, Tuesdays and Fridays; and Mr. J. Strond Hosford, Mondays, Thursdays, and Saturdays. *Mornings: Mr. E. Brooksbank James, Mondays* and Thursdays; Mr. A. W. Ormond, Wednesdays and Saturdays; Mr. H. Willoughby Lyle, Tuesdays and Fridays. Qualified practitioners and students are admitted to the practice of the hospital upon the recommendation of the medical staff. Courses of instruction in Ophthalmology will be given during October, November, and December, 1908. Lectures will be delivered on Monday, Wednesday, and Friday *evenings at 8 P.M. In addition special lectures* or clinical demonstrations will be given by the hospital staff on dates to be announced. Fee for the course, £2 2s.; including three months' hospital practice, £3 3s. Tutorial or coaching classes for the various examinations arranged as far as possible to suit candidates. Further particulars may be obtained from the honorary secretary, Mr. H. Willoughby Lyle.

CENTRAL *LONDON OPHTHALMIC HOSPITAL, Gray's Inn*-road, W.C.—This hospital has 26 beds and possesses facilities for clinical teaching daily. Last year there were 409 in- and 12,809 out-patients (entailing 29,345 attendances). Classes of instruction in the various branches of *Ophthalmology* will be held during the winter session, commencing in October. The out-patient work begins at 1 o'clock and operations are performed daily between 1 and 4. Consulting *Physician: Sir Dyce Duckworth.* Surgeons: Mr. T. Brittin Archer, Mr. Ernest Clarke, Mr. *A. P.* L. Wells, and Mr. H. Parker. Assistant Surgeons: Mr. Ilbert Hancock and Mr. Stephen *Mayou*. *Physician*: Mr. Charles O. Hawthorne. Pathologist: Mr. Stephen Mayou. House *Surgeon: Mr.* E. L. Marchant. Dentist: Mr. E. P. May. Secretary: Mr. H. R. S. Druce.

CENTRAL LONDON THROAT AND EAR HOSPITAL, Gray's Inn-road.—In addition to *the new In-patient* Department and operation theatre the hospital has a very extensive out-patient department, which is open to all medical practitioners and students for the purpose of clinical demonstration and instruction during the hours of the surgeons' visits. During the past *year 9993* out-patients (involving 46,859 attendances) and 564 in-patients were treated. The fee *for three* months' attendance, 5 guineas; for six months, 8 guineas. The post-graduate *teaching* consists of successive series of practical demonstrations by the members of the staff *delivered* twice weekly during the winter and summer sessions. They are so arranged *that practitioners* joining at any part of the course are enabled to complete the group of subjects. *The fee for* each course is three guineas, with daily attendance at the out-patient department during *the* period *of* the course. Details of subjects, &c., will be afforded by the Dean. Considerable *attention* is given to scientific work, particularly with regard to Bacteriology of the ear and respiratory passages. *Operation days: in-patients,* Tuesday, Wednesday, Thursday, and Friday, at 2 P.M.; out-patients, daily at 9 A.M. Consulting Physician: Dr. *Arthur Orwin.* Consulting Surgeon: Mr. Thomas Nunn. Surgeons: Dr. Dundas Grant, Dr. Percy Jakins, Mr. Chichele Nourse, and Dr. Abercrombie. Assistant Surgeons: Mr. Stuart Low, Dr. Andrew Wylie, Dr. Atkinson, and Dr. McKenzie. Pathologist: Dr. Wyatt Wingrave. Dental *Surgeon: Mr. Whishaw Wallis. Assistant Dental* Surgeon: Mr. Henning James. Anæsthetist: Mr. W. Hotten George. Assistant Anæsthetists: Dr. Beresford Kingsford, Dr. Mortimer, and Dr. Crampton In addition the following appointments are open to qualified members of the profession:—Three Registrars, tenable for *twelve months; and twelve* Clinical Assistants, tenable for three or six months. Secretary: Mr. Richard Kershaw. Dean: Dr. Wyatt Wingrave.

LONDON *THROAT HOSPITAL, 204*, Great Portland-street, W.—Clinical Demonstrations on the Diseases of the Throat, Nose, and Ear are given daily at 2 P.M. and on Tuesday and Friday evenings at 6 P.M. Operations are performed daily at 9.30 A.M. Individual instruction is given in the *examination of cases to students attending the hospital.* Fees: one month's attendance, £1 1s.; three months, £2 2s.; perpetual, £5 5s. Detailed information may be obtained from the Hon. Secretary of the Medical Committee. Surgeons: Mr. Claud Woakes, Dr. Furniss Potter, Dr. G. Cathcart, Mr. W. H. Kelson, and Mr. Atwood Thorne. Assistant Surgeons: Mr. Sommerville Hastings and Mr. Seccombe Hett.

THE METROPOLITAN EAR, NOSE, AND THROAT HOSPITAL.—*The hospital was founded in 1838 and is situated in* Grafton-street, Tottenham-court-road. The out-patient department is opened daily at 2.30 P.M. to all medical practitioners and senior students for acquiring clinical instruction and technical knowledge. Operations upon in-patients *are performed on Tuesdays, Wednesdays, and Thursdays at* 9.30 A.M. Fee for one month's attendance at the hospital £1 1s., and for three months £2 2s. During the forthcoming session practical demonstrations *will be given by members* of the staff on the diagnosis and treatment of diseases of the ear and respiratory passages. Each course may commence at any time. Consulting Surgeons: Mr. G. *Saunders* and Mr. J. Pickett. Surgeons: Mr. H. Pegler, Mr. F. Spicer, and Mr. W. J. *Horne. Assistant* Surgeons: Mr. C. Fox, Mr. B. Jones, and Mr. J. C. Potter. Anæsthetists: Mr. J. Brunton and Mr. C. N. Barton. Dentist: Mr. E. Davis.

ROYAL EAR HOSPITAL, *Dean-street, Soho. (Founded* 1816.)—Courses of instruction of a practical character in Diseases of the Ear and Nose are given by the members of the staff throughout the year. Clinical assistants are also appointed. The new hospital is now in full working order. *Students may join at any time.* For information address the Honorary Secretary of the Medical Board, Royal Ear Hospital, Dean-street, Soho. Surgeons: Mr. M. Yearsley and Mr. Richard *Lake.* Assistant Surgeons: Mr. W. H. Bowen, Mr. E. A. Peters, Mr. R. S. Cocke, and Mr. A. Evans. Anæsthetists: Mr. F. D. Bennett, Mr. J. H. Chaldecott, and Dr. F. E. Shipway. Dental Surgeon: Mr. F. W. Barrett. Ophthalmic Surgeon: Mr. H. W. Lyle.

ST. PETER'S HOSPITAL FOR STONE AND URINARY DISEASES, Henrietta-street, Covent-garden. Established 1860. New Hospital opened, 1882.—Honorary Surgeons: *Mr. F. Swinford Edwards and Mr. P. J. Freyer.* Assistant Surgeons: Mr. John Pardoe and Mr. J. W. Thomson Walker. The hospital contains 30 beds for men and 2 beds for women and children. Consultations are held and operations are performed each Wednesday and Friday at 2 P.M. Medical practitioners and students are invited to the clinical instructions which are given in the wards and out-patient department daily, and to the operations in the theatre on Wednesdays and Fridays at 2 P.M. Average beds occupied daily, 30; average out-patients seen daily, 100.

ST. JOHN'S HOSPITAL FOR DISEASES OF THE SKIN *Leicester-square, W.C. Rebuilt 1905.*—The *in-patient department*, 40 beds, is at 262, Uxbridge-road, W. The out-patient practice is open to the medical profession at the following times: Every day, from *2 to 4 P.M., and every* evening (except Saturday) 6 to 8. At the afternoon clinics specially selected Clinical Demonstrations, also demonstrations on the different diseases presenting themselves in the out-patient department, followed by Lectures, will be given. The x ray department is in operation every afternoon except Saturday. The Chesterfield Lectures are given on Thursdays at 6 P.M. October to March in the lecture room at 49.

Leicester-square. The opening lecture on Cataphoresis in General and Special Medicine will be given by Dr. Morgan Dockrell on Oct. 8th. At the end of the course the Chesterfield silver medal may be competed for by those who have attended three-fourths of the lectures. Physicians: Dr. Morgan Dockrell, Dr. M. K. Hargreaves, Dr. Thomas D. Savill, Dr. Alfred Eddowes, and Dr. G. W. Dawson. Assistant Physicians: Dr. Agnes F. Savill, Dr. V. H. Rutherford, and Dr. Louis F. Knuthsen. Medical Officer to X-ray Department: Mr. Chisholm Williams.

LONDON LOCK HOSPITAL AND RESCUE HOME.—This institution consists of a hospital for females in the Harrow-road and a hospital for males in Dean-street, Soho. At the latter branch an out-patient department is attached and both sexes receive treatment. In the female branch there are 120 beds and 461 patients were admitted in 1907. In the male branch there are 27 beds which during 1907 accommodated 235 patients. Over 34,000 out-patients were treated. Patients are seen at Dean-street on Mondays from 1 to 2 P.M. and from 6 to 8 P.M.; on Tuesdays and Wednesdays from 6 to 8 P.M.; on Fridays from 2 to 3 P.M. (female patients); and on Saturdays from 2 to 4 P.M. Consulting Surgeons: Mr. Buxton Shillitoe and Mr. J. A. Bloxam. Consulting Ophthalmic Surgeon: Mr. Henry Edward Juler. Physician: Dr. Sidney Phillips. Surgeons: Mr. J. Ernest Lane, Mr. Arthur Shillitoe, and Mr. Charles Gibbs. Surgeons to Out-patients: Mr. Charles Ryall, Mr. Herbert J Paterson and Mr. Ernest C. Hughes. House Surgeon at the Female Hospital: Mr. J. Johnston Abraham. House Surgeon at the Male Hospital and Out-patients' Department: Mr. H. S. Pinker.

3RD COUNTY OF LONDON FIELD AMBULANCE, 1ST LONDON DIVISION, 51, Calthorpe-street, Gray's Inn-road, W.C.—Officer Commanding: Lieutenant-Colonel J. Harper. The 3rd County of London Field Ambulance, 1st London Division bears the same relation to the Territorial Army as the Royal Army Medical Corps bears to the regular Army. The course of training has the great advantage of affording, in addition to a knowledge of ordinary military duties, special ambulance instruction useful in all ranks of life. All students who are thinking of entering either of the public services are strongly recommended to join. The instruction received will be found of the greatest advantage to such as intend joining either the Royal Army Medical Corps or the Indian Medical Service on the completion of their hospital course, the work taught in this Field Ambulance being practically the same as that taught at the Depôt, Royal Army Medical Corps, Aldershot, and in which an examination is held at the end of the four months' course there before the young officers are drafted to their different stations. A sound knowledge of the work which can be obtained in the Field Ambulance must necessarily be of great benefit to those going through the depôt and give a decided advantage over those who have had no previous military training. In addition to the *drills* of an ordinary infantry corps, the special training includes stretcher and wagon and cacolet drill; the use of improvised seats and stretchers; the use and application of bandages, splints, &c.; the duties of the *personnel* of a field ambulance; lectures by the officers on first aid to the injured, and on the elements of anatomy, physiology, hygiene, and nursing, which are so arranged as *not* to interfere with the lectures, &c., carried on at the various hospitals in London. The Ambulance goes into camp for eight to 15 days in the summer each year for field training with its brigade or division. There is also a Shooting Club in the corps, in which instruction in, and facilities for, the practice of rifle shooting are given. There is a Transport Section in connexion with the corps, the members of which go through a course of instruction in riding and driving and transport work with the regular troops. There are also sections of Cyclists and Signallers. A Gymnastic and Boxing Class meets once a week at headquarters, under a professional instructor. Lectures are delivered during the winter session. The Sergeant Major will give any information respecting the above on application to the headquarters, 51, Calthorpe-street, Gray's Inn-road, W.C.

COOKE'S SCHOOL OF ANATOMY, PHYSIOLOGY, AND OPERATIVE SURGERY, London.—The school is prepared to admit to its supplementary work all who may wish to join the same, but in regard to its curriculum work it does not receive more than half-a-dozen students in the course of the year; these have special advantages both as regards Anatomy and Physiology. Charges are but slightly in excess of current charges and particulars are forwarded on application. By the decision of various examining bodies gentlemen rejected at their Anatomical and Physiological Examinations can get signed up for the supplementary work they are required to put in before re-examination. The operations of surgery are performed on the dead body and the courses are recognised for army promotion. The school possesses a good collection of physiological and chemical apparatus and candidates for the higher examinations receive special instruction in the more difficult subjects.

PROVINCIAL MEDICAL SCHOOLS AND HOSPITALS HAVING SPECIAL CLASSES AND FACILITIES FOR CLINICAL STUDY.[1]

THE number of important provincial medical schools has much grown of late in England mainly owing to the foundation of the new provincial universities. The faculty of medicine of these universities is able to arrange a full medical curriculum for students with access to the different hospitals, large and small, of the university city, and the students at these schools will receive at the end of their medical course a degree in medicine. We have already described the academic procedure to obtain the degrees; we now enumerate the hospitals at which the students of the medical schools of the universities can complete their medical *education*.

UNIVERSITY OF OXFORD: RADCLIFFE INFIRMARY AND COUNTY HOSPITAL.—Courses of instruction are given in connexion with the Oxford University Medical School. These include (1) a course in Practical Medicine by the Regius Professor of Medicine; (2) Clinical lectures by the Litchfield Lecturers in Medicine and Surgery; and (3) tutorial instruction and demonstrations in special Regional Anatomy (medical and surgical), methods of Medical and Surgical Diagnosis, and Surgical Manipulation. Pathological demonstrations are given in the post-mortem room at the Pathological Laboratory by the Professor of Pathology. Practical Pharmacy is taught in the Radcliffe Dispensary. Opportunities are offered to students who wish to act as surgical dressers and clinical clerks in the out patient departments and in the wards. The Infirmary contains 150 beds. Honorary Physician: Dr. E. B. Gray. Honorary Surgeons: Mr. J. Briscoe and Mr. A. Winkfield Active Consulting Physician: Professor William Osler. Acting Staff:—Honorary Physicians: Dr. W Tyrrell Brooks, Dr. W. Collier, and Dr. E. Marlam. Honorary Assistant Physician and Medical Registrar: Dr. A. Waters. Honorary Surgeons: Mr. Horatio P. Symonds, Mr. R. H. A. Whitelocke, and Mr. A. P. Parker. Honorary Assistant Surgeon and Surgical Registrar: Mr. E. C. Bevers. Consulting Ophthalmic Surgeon: Mr. R. W. Doyne. Pathologist: Professor Georges Dreyer. Consulting Dental Surgeon: Mr. E. A. Bevers. Honorary Radiographer: Dr. R H Sankey. House Physician: Dr. W. Hal Barnett. House Surgeon: Mr. H. R. Ramsbotham. Junior House Surgeon: Mr. G. Moore Johnson.

UNIVERSITY OF CAMBRIDGE: ADDENBROOKE'S HOSPITAL.—Clinical Lectures in Medicine and Surgery, in connexion with Cambridge University Medical School, are delivered at this hospital twice a week during the academical year; and practical instruction in Medicine and Surgery in the wards and out-patients' rooms is given by the physicians and surgeons daily, during the vacations as well as term time. Instruction is also given in the special methods of medical and surgical investigation. Clinical Clerks and Dressers are selected from students according to merit. The composition fee for pupilship is 8 guineas. Consulting Physician: Dr. P. W. Latham and Dr. D. MacAlister. Consulting Surgeon: Mr. G. Wallis. Physicians: Sir T. C. Allbutt, Dr. J. B Bradbury, and Dr. L. Humphry. Assistant Physicians: Dr E. Lloyd-Jones and Dr J. A. Wright. Surgeons: Mr. G. Wallis, Mr. G. E. Wherry, Mr. F. Deighton, Mr. J. Griffiths, and Mr. F. H Marsh Assistant Surgeon: Mr. Cooke Consulting Dental Surgeon: Mr. W. A. Rhodes.

---

[1] For Scholarships see p. 664 et seq.

Assistant Surgeons: Mr. J. H. Parsons and Mr. C. Worth. Medical Officer to the X Ray Department: Mr. J. M. Davidson. Curator and Librarian: Mr. G. Coats. Bacteriologist: Dr. B. H. Wedd. Senior House Surgeon: Mr. A. C. Hudson. Second House Surgeon: Mr. Norman E. Gibbs. Third House Surgeon: Mr. J. Stevenson Wilson. Refraction Assistants: Mr. T. Phillips, Mrs. Warner, Mr. G. T. Mould, and Miss S. Seekings.

ROYAL WESTMINSTER OPHTHALMIC HOSPITAL, King William-street, West Strand.—The hospital contains 40 free beds. Patients, who number over 11,000 annually, are seen at 1 P.M., and operations performed daily at 2 P.M. The following are the days of attendance of the surgeons: Mr. Hartridge and Mr. Grimsdale, Mondays and Thursdays; Mr. Roll and Mr. McMullen, Tuesdays and Fridays; and Mr. Dodd and Mr. Brewerton, Wednesdays and Saturdays. The practice of the hospital is open to practitioners and students. Fees for six months, £3 3*s.*; perpetual, £5 5*s.* Students of the hospital are eligible for the posts of house surgeon and clinical assistants. Special demonstrations and lectures will be given during the session, commencing early in October; for details see weekly journals. Clinical Assistants (who must be duly qualified) to the Surgeons are appointed for periods of six months. Secretary: Mr. John Hy. Johnson.

ROYAL EYE HOSPITAL, St. George's-circus, Southwark, S.E.—There are 40 beds and 2 cots. There were 84,108 attendances in the Out-patient Department last year and the new patients numbered 28,144. Operations are performed and out-patients are seen daily at 9 A.M. and 2 P.M. The following are the days of attendance:—Afternoons: Mr. M. M. McHardy, Tuesdays and Thursdays; Sir William J. Collins, Mondays and Wednesdays; Mr. L. V. Cargill, Tuesdays and Fridays; and Mr. J. Stroud Hosford, Mondays, Thursdays, and Saturdays. Mornings: Mr. E. Brooksbank James, Mondays and Thursdays; Mr. A. W. Ormond, Wednesdays and Saturdays; Mr. H. Willoughby Lyle, Tuesdays and Fridays. Qualified practitioners and students are admitted to the practice of the hospital upon the recommendation of the medical staff. Courses of instruction in Ophthalmology will be given during October, November, and December, 1908. Lectures will be delivered on Monday, Wednesday, and Friday evenings at 8 P.M. In addition special lectures or clinical demonstrations will be given by the hospital staff on dates to be announced. Fee for the course, £2 2*s.*; including three months' hospital practice, £3 3*s.* Tutorial or coaching classes for the various examinations arranged as far as possible to suit candidates. Further particulars may be obtained from the honorary secretary, Mr. H. Willoughby Lyle.

CENTRAL LONDON OPHTHALMIC HOSPITAL, Gray's Inn-road, W.C.—This hospital has 26 beds and possesses facilities for clinical teaching daily. Last year there were 409 in- and 12,809 out-patients (entailing 29,345 attendances). Classes of instruction in the various branches of Ophthalmology will be held during the winter session, commencing in October. The out-patient work begins at 1 o'clock and operations are performed daily between 1 and 4. Consulting Physician: Sir Dyce Duckworth. Surgeons: Mr. T. Brittin Archer, Mr. Ernest Clarke, Mr. A. P. L. Wells, and Mr. H. Parker. Assistant Surgeons: Mr. Ilbert Hancock and Mr. Stephen Mayou. Physician: Mr. Charles O. Hawthorne. Pathologist: Mr. Stephen Mayou. House Surgeon: Mr. E. L. Marchant. Dentist: Mr. E. P. May. Secretary: Mr. H. R. S. Druce.

CENTRAL LONDON THROAT AND EAR HOSPITAL, Gray's Inn-road.—In addition to the new In-patient Department and operation theatre the hospital has a very extensive out-patient department, which is open to all medical practitioners and students for the purpose of clinical demonstration and instruction during the hours of the surgeons' visits. During the past year 9993 out-patients (involving 46,859 attendances) and 564 in-patients were treated. The fee for three months' attendance, 5 guineas; for six months, 8 guineas. The post-graduate teaching consists of successive series of practical demonstrations by the members of the staff delivered twice weekly during the winter and summer sessions. They are so arranged that practitioners joining at any part of the course are enabled to complete the group of subjects. The fee for each course is three guineas, with daily attendance at the out-patient department during the period of the course. Details of subjects, &c., will be afforded by the Dean. Considerable attention is given to scientific work, particularly with regard to Bacteriology of the ear and respiratory passages. Operation days: in-patients, Tuesday, Wednesday, Thursday, and Friday, at 2 P.M.; out-patients, daily at 9 A.M. Consulting Physician: Dr. Arthur Orwin. Consulting Surgeon: Mr. Thomas Nunn. Surgeons: Dr. Dundas Grant, Dr. Percy Jakins, Mr. Chichele Nourse, and Dr. Abercrombie. Assistant Surgeons: Mr. Stuart Low, Dr. Andrew Wylie, Dr. Atkinson, and Dr. McKenzie. *Pathologist*: Dr. Wyatt Wingrave. *Dental* Surgeon: Mr. Whishaw Wallis. Assistant Dental Surgeon: Mr. Henning James. Anæsthetist: Mr. W. Hotten George. Assistant Anæsthetists: Dr. Beresford Kingsford, Dr. Mortimer, and Dr. Crampton In addition the following appointments are open to qualified members of the profession:—Three Registrars, tenable for twelve months; and twelve Clinical Assistants, tenable for three or six months. Secretary: Mr. Richard Kershaw. Dean: Dr. Wyatt Wingrave.

LONDON THROAT HOSPITAL, 204, Great Portland-street, W.—Clinical Demonstrations on the Diseases of the Throat, Nose, and Ear are given daily at 2 P.M. and on Tuesday and Friday evenings at 6 P.M. Operations are performed daily at 9.30 A.M. Individual instruction is given in the examination of cases to students attending the hospital. Fees: one month's attendance, £1 1*s.*; three months, £2 2*s.*; perpetual, £5 5*s.* Detailed information may be obtained from the Hon. Secretary of the Medical Committee. Surgeons: Mr. Claud Woakes, Dr. Furniss Potter, Dr. G. Cathcart, Mr. W. H. Kelson, and Mr. Atwood Thorne. Assistant Surgeons: Mr. Sommerville Hastings and Mr. Seccombe Hett.

THE METROPOLITAN EAR, NOSE, AND THROAT HOSPITAL.—The hospital was founded in 1838 and is situated in Grafton-street, Tottenham-court-road. The out-patient department is opened daily at 2.30 P.M. to all medical practitioners and senior students for acquiring clinical instruction and technical knowledge. Operations upon in-patients are performed on Tuesdays, Wednesdays, and Thursdays at 9.30 A.M. Fee for one month's attendance at the hospital £1 1*s.*, and for three months £2 2*s.* During the forthcoming session practical demonstrations will be given by members of the staff on the diagnosis and treatment of diseases of the ear and respiratory passages. Each course may commence at any time. Consulting Surgeons: Mr. G. Saunders and Mr. J. Pickett. Surgeons: Mr. H. Pegler, Mr. F. Spicer, and Mr. W. J. Horne. *Assistant* Surgeons: Mr. C. Fox, Mr. B. Jones, and Mr. J. C. Potter. Anæsthetists: Mr. J. Brunton and Mr. C. N. Barton. Dentist: Mr. E. Davis.

ROYAL EAR HOSPITAL, Dean-street, Soho. (Founded 1816.)—Courses of instruction of a practical character in Diseases of the Ear and Nose are given by the members of the staff throughout the year. Clinical assistants are also appointed. The new hospital is now in full working order. Students may join at any time. For information address the Honorary Secretary of the Medical Board, Royal Ear Hospital, Dean-street, Soho. Surgeons: Mr. M. Yearsley and Mr. Richard Lake. Assistant Surgeons: Mr. W. H. Bowen, Mr. E. A. Peters, Mr. R. S. Cocke, and Mr. A. Evans. Anæsthetists: Mr. F. D. Bennett, Mr. J. H. Chaldecott, and Dr. F. E. Shipway. Dental Surgeon: Mr. F. W. Barrett. Ophthalmic Surgeon: Mr. H. W. Lyle.

ST. PETER'S HOSPITAL FOR STONE AND URINARY DISEASES, Henrietta-street, Covent-garden. Established 1860. New Hospital opened, 1882.—Honorary Surgeons: Mr. F. Swinford Edwards and Mr. P. J. Freyer. Assistant Surgeons: Mr. John Pardoe and Mr. J. W. Thomson Walker. The hospital contains 30 beds for men and 2 beds for women and children. Consultations are held and operations are performed each Wednesday and Friday at 2 P.M. Medical practitioners and students are invited to the clinical instructions which are given in the wards and out-patient department daily, and to the operations in the theatre on Wednesdays and Fridays at 2 P.M. Average beds occupied daily, 30; average out-patients seen daily, 100.

ST. JOHN'S HOSPITAL FOR DISEASES OF THE SKIN Leicester-square, W.C. Rebuilt 1905.—The in-patient department, 40 beds, is at 262, Uxbridge-road, W. The out-patient practice is open to the medical profession at the following times: Every day, from 2 *to* 4 P.M., and every evening (except Saturday) 6 to 8. At the afternoon clinics specially selected Clinical Demonstrations, also demonstrations on the different diseases presenting themselves in the out-patient department, followed by Lectures, will be given. The x ray department is in operation every afternoon except Saturday. The Chesterfield Lectures are given on Thursdays at 6 P.M. October to March in the lecture room at 49, Leicester-square. The opening lecture on Cataphoresis in General and Special Medicine will be given by Dr. Morgan Dockrell on Oct. 8th. At the end of the course the Chesterfield silver medal may be competed for by those who have attended three-fourths of the lectures. Physicians: Dr. Morgan Dockrell. Dr. M. K. Hargreaves, Dr. Thomas D. Savill, Dr. Alfred Eddowes. and Dr. G. W. Dawson. Assistant Physicians: Dr. Agnes F. Savill. Dr. V. H. Rutherford, and Dr. Louis F. Knuthsen. Medical Officer to X-ray Department: Mr. Chisholm Williams.

LONDON LOCK HOSPITAL AND RESCUE HOME.—This institution consists of a hospital for females in the Harrow-road and a hospital for males in Dean-street. Soho. At the latter branch an out-patient department is attached and both sexes receive treatment. In the female branch there are 120 beds and 461 patients were admitted in 1907. In the male branch there are 27 beds which during 1907 accommodated 235 patients. Over 34,000 out-patients were treated. Patients are seen at Dean-street on Mondays from 1 to 2 P.M. and from 6 to 8 P.M.; on Tuesdays and Wednesdays from 6 to 8 P.M.; on Fridays from 2 to 3 P.M. (female patients); and on Saturdays from 2 to 4 P.M. Consulting Surgeons: Mr. Buxton Shillitoe and Mr. J. A. Bloxam. Consulting Ophthalmic Surgeon: Mr. Henry Edward Juler. Physician: Dr. Sidney Phillips. Surgeons: Mr. J. Ernest Lane, Mr. Arthur Shillitoe, and Mr. Charles Gibbs. Surgeons to Out-patients: Mr. Charles Ryall, Mr. Herbert J Paterson and Mr. Ernest C. Hughes. House Surgeon at the Female Hospital: Mr. J. Johnston Abraham. House Surgeon at the Male Hospital and Out-patients' Department: Mr. H. S. Pinker.

3RD COUNTY OF LONDON FIELD AMBULANCE, 1ST LONDON DIVISION, 51. Calthorpe-street, Gray's Inn-road, W.C.—Officer Commanding: Lieutenant-Colonel J. Harper. The 3rd County of London Field Ambulance, 1st London Division. bears the same relation to the Territorial Army as the Royal Army Medical Corps bears to the regular Army. The course of training has the great advantage of affording, in addition to a knowledge of ordinary military duties, special ambulance instruction useful in all ranks of life. All students who are thinking of entering either of the public services are strongly recommended to join. The instruction received will be found of the greatest advantage to such as intend joining either the Royal Army Medical Corps or the Indian Medical Service on the completion of their hospital course, the work taught in this Field Ambulance being practically the same as that taught at the Depôt, Royal Army Medical Corps, Aldershot, and in which an examination is held at the end of the four months' course there before the young officers are drafted to their different stations. A sound knowledge of the work which can be obtained in the Field Ambulance must necessarily be of great benefit to those going through the depôt and give a decided advantage over those who have had no previous military training. In addition to the drills of an ordinary infantry corps, the special training includes stretcher and wagon and cacolet drill; the use of improvised seats and stretchers; the use and application of bandages, splints, &c.; the duties of the *personnel* of a field ambulance; lectures by the officers on first aid to the injured, and on the elements of anatomy, physiology, hygiene, and nursing, which are so arranged as not to interfere with the lectures, &c., carried on at the various hospitals in London. The Ambulance goes into camp for eight to 15 days in the summer each year for field training with its brigade or division. There is also a Shooting Club in the corps, in which instruction in, and facilities for, the practice of rifle shooting are given. There is a Transport Section in connexion with the corps, the members of which go through a course of instruction in riding and driving and transport work with the regular troops. There are also sections of Cyclists and Signallers. A Gymnastic and Boxing Class meets once a week at headquarters, under a professional instructor. Lectures are delivered during the winter session. The Sergeant Major will give any information respecting the above on application to the headquarters, 51, Calthorpe-street, Gray's Inn-road, W.C.

COOKE'S SCHOOL OF ANATOMY, PHYSIOLOGY, AND OPERATIVE SURGERY, London.—The school is prepared to admit to its supplementary work all who may wish to join the same, but in regard to its curriculum work it does not receive more than half-a-dozen students in the course of the year; these have special advantages both as regards Anatomy and Physiology. Charges are but slightly in excess of current charges and particulars are forwarded on application. By the decision of various examining bodies gentlemen rejected at their Anatomical and Physiological Examinations can get signed up for the supplementary work they are required to put in before re-examination. The operations of surgery are performed on the dead body and the courses are recognised for army promotion. The school possesses a good collection of physiological and chemical apparatus and candidates for the higher examinations receive special instruction in the more difficult subjects.

PROVINCIAL MEDICAL SCHOOLS AND HOSPITALS HAVING SPECIAL CLASSES AND FACILITIES FOR CLINICAL STUDY.[1]

THE number of important provincial medical schools has much grown of late in England mainly owing to the foundation of the new provincial universities. The faculty of medicine of these universities is able to arrange a full medical curriculum for students with access to the different hospitals, large and small, of the university city, and the students at these schools will receive at the end of their medical course a degree in medicine. We have already described the academic procedure to obtain the degrees; we now enumerate the hospitals at which the students of the medical schools of the universities can complete their medical education.

UNIVERSITY OF OXFORD: RADCLIFFE INFIRMARY AND COUNTY HOSPITAL.—Courses of instruction are given in connexion with the Oxford University Medical School. These include (1) a course in Practical Medicine by the Regius Professor of Medicine; (2) Clinical lectures by the Litchfield Lecturers in Medicine and Surgery; and (3) tutorial instruction and demonstrations in special Regional Anatomy (medical and surgical), methods of Medical and Surgical Diagnosis, and Surgical Manipulation. Pathological demonstrations are given in the post-mortem room at the Pathological Laboratory by the Professor of Pathology. Practical Pharmacy is taught in the Radcliffe Dispensary. Opportunities are offered to students who wish to act as surgical dressers and clinical clerks in the out patient departments and in the wards. The Infirmary contains 150 beds. Honorary Physician: Dr. E. B. Gray. Honorary Surgeons: Mr. J. Briscoe and Mr. A. Winkfield Active Consulting Physician: Professor William Osler. Acting Staff:—Honorary Physicians: Dr. W Tyrrell Brooks, Dr. W. Collier, and Dr. E. Marlam. Honorary Assistant Physician and Medical Registrar: Dr. A. Waters. Honorary Surgeons: Mr. Horatio P. Symonds, Mr. R. H. A. Whitelocke, and Mr. A. P. Parker. Honorary Assistant Surgeon and Surgical Registrar: Mr. E. C. Bevers. Consulting Ophthalmic Surgeon: Mr. R. W. Doyne. Pathologist: Professor Georges Dreyer. Consulting Dental Surgeon: Mr. E. A. Bevers. Honorary Radiographer: Dr. R H Sankey. House Physician: Dr. W. Hal Barnett. House Surgeon: Mr. H. R. Ramsbotham. Junior House Surgeon: Mr. G. Moore Johnson.

UNIVERSITY OF CAMBRIDGE: ADDENBROOKE'S HOSPITAL.—Clinical Lectures in Medicine and Surgery, in connexion with Cambridge University Medical School, are delivered at this hospital twice a week during the academical year; and practical instruction in Medicine and Surgery in the wards and out-patients' rooms is given by the physicians and surgeons daily, during the vacations as well as term time. Instruction is also given in the special methods of medical and surgical investigation. Clinical Clerks and Dressers are selected from students according to merit. The composition fee for pupilship is 8 guineas. Consulting Physician: Dr. P. W. Latham and Dr. D. MacAlister. Consulting Surgeon: Mr. G. Wallis. Physicians: Sir T. C. Allbutt, Dr. J. B Bradbury, and Dr. L. Humphry. Assistant Physicians: Dr E. Lloyd-Jones and Dr J. A. Wright. Surgeons: Mr. G. Wallis, Mr. G. E. Wherry, Mr. F. Deighton, Mr. J. Griffiths, and Mr. F. H Marsh Assistant Surgeon: Mr. Cooke Consulting Dental Surgeon: Mr. W. A. Rhodes.

---

[1] For Scholarships see p. 664 et seq.

Assistant Surgeons: Mr. J. H. Parsons and Mr. C. Worth. Medical Officer to the X Ray Department: Mr. J. M. Davidson. Curator and Librarian: Mr. G. Coats. Bacteriologist: Dr. B. H. Wedd. Senior House Surgeon: Mr. A. C. Hudson. Second House Surgeon: Mr. Norman E. Gibbs. Third House Surgeon: Mr. J. Stevenson Wilson. Refraction Assistants: Mr. T. Phillips, Mrs. Warner, Mr. G. T. Mould, and Miss S. Seckings.

ROYAL WESTMINSTER OPHTHALMIC HOSPITAL, King William-street, West Strand.—The hospital contains 40 free beds. Patients, who number over 11,000 annually, are seen at 1 P.M., and operations performed daily at 2 P.M. The following are the days of attendance of the surgeons: Mr. Hartridge and Mr. Grimsdale, Mondays and Thursdays; Mr. Roll and Mr. McMullen, Tuesdays and Fridays; and Mr. Dodd and Mr. Brewerton, Wednesdays and Saturdays. The practice of the hospital is open to practitioners and students. Fees for six months, £3 3s.; perpetual, £5 5s. Students of the hospital are eligible for the posts of house surgeon and clinical assistants. Special demonstrations and lectures will be given during the session, commencing early in October; for details see weekly journals. Clinical Assistants (who must be duly qualified) to the Surgeons are appointed for periods of six months. Secretary: Mr. John Hy. Johnson.

ROYAL EYE HOSPITAL, St. George's-circus, Southwark, S.E.—There are 40 beds and 2 cots. There were 84,108 attendances in the Out-patient Department last year and the new patients numbered 28,144. Operations are performed and out-patients are seen daily at 9 A.M. and 2 P.M. The following are the days of attendance:—Afternoons: Mr. M. M. McHardy, Tuesdays and Thursdays; Sir William J. Collins, Mondays and Wednesdays; Mr. L. V. Cargill, Tuesdays and Fridays; and Mr. J. Stroud Hosford, Mondays, Thursdays, and Saturdays. Mornings: Mr. E. Brooksbank James, Mondays and Thursdays; Mr. A. W. Ormond, Wednesdays and Saturdays; Mr. H. Willoughby Lyle, Tuesdays and Fridays. Qualified practitioners and students are admitted to the practice of the hospital upon the recommendation of the medical staff. Courses of instruction in Ophthalmology will be given during October, November, and December, 1908. Lectures will be delivered on Monday, Wednesday, and Friday evenings at 8 P.M. In addition special lectures or clinical demonstrations will be given by the hospital staff on dates to be announced. Fee for the course, £2 2s.; including three months' hospital practice, £3 3s. Tutorial or coaching classes for the various examinations arranged as far as possible to suit candidates. Further particulars may be obtained from the honorary secretary, Mr. H. Willoughby Lyle.

CENTRAL LONDON OPHTHALMIC HOSPITAL, Gray's Inn-road, W.C.—This hospital has 26 beds and possesses facilities for clinical teaching daily. Last year there were 409 in- and 12,809 out-patients (entailing 29,345 attendances). Classes of instruction in the various branches of Ophthalmology will be held during the winter session, commencing in October. The out-patient work begins at 1 o'clock and operations are performed daily between 1 and 4. Consulting Physician: Sir Dyce Duckworth. Surgeons: Mr. T. Brittin Archer, Mr. Ernest Clarke, Mr. A. P. L. Wells, and Mr. H. Parker. Assistant Surgeons: Mr. Ilbert Hancock and Mr. Stephen Mayou. Physician: Mr. Charles O. Hawthorne. Pathologist: Mr. Stephen Mayou. House Surgeon: Mr. E. L. Marchant. Dentist: Mr. E. P. May. Secretary: Mr. H. R. S. Druce.

CENTRAL LONDON THROAT AND EAR HOSPITAL, Gray's Inn-road.—In addition to the new In-patient Department and operation theatre the hospital has a very extensive out-patient department, which is open to all medical practitioners and students for the purpose of clinical demonstration and instruction during the hours of the surgeons' visits. During the past year 9993 out-patients (involving 46,859 attendances) and 564 in-patients were treated. The fee for three months' attendance, 5 guineas; for six months, 8 guineas. The post-graduate teaching consists of successive series of practical demonstrations by the members of the staff delivered twice weekly during the winter and summer sessions. They are so arranged that practitioners joining at any part of the course are enabled to complete the group of subjects. The fee for each course is three guineas, with daily attendance at the out-patient department during the period of the course. Details of subjects, &c., will be afforded by the Dean. Considerable attention is given to scientific work, particularly with regard to Bacteriology of the ear and respiratory passages. Operation days: in-patients, Tuesday, Wednesday, Thursday, and Friday, at 2 P.M.; out-patients, daily at 9 A.M. Consulting Physician: Dr. Arthur Orwin. Consulting Surgeon: Mr. Thomas Nunn. Surgeons: Dr. Dundas Grant, Dr. Percy Jakins, Mr. Chichele Nourse, and Dr. Abercrombie. Assistant Surgeons: Mr. Stuart Low, Dr. Andrew Wylie, Dr. Atkinson, and Dr. McKenzie. Pathologist: Dr. Wyatt Wingrave. Dental Surgeon: Mr. Whishaw Wallis. Assistant Dental Surgeon: Mr. Henning James. Anæsthetist: Mr. W. Hotten George. Assistant Anæsthetists: Dr. Beresford Kingsford, Dr. Mortimer, and Dr. Crampton In addition the following appointments are open to qualified members of the profession: —Three Registrars, tenable for twelve months; and twelve Clinical Assistants, tenable for three or six months. Secretary: Mr. Richard Kershaw. Dean: Dr. Wyatt Wingrave.

LONDON THROAT HOSPITAL, 204, Great Portland-street, W.—Clinical Demonstrations on the Diseases of the Throat, Nose, and Ear are given daily at 2 P.M. and on Tuesday and Friday evenings at 6 P.M. Operations are performed daily at 9.30 A.M. Individual instruction is given in the examination of cases to students attending the hospital. Fees: one month's attendance, £1 1s.; three months, £2 2s.; perpetual, £5 5s. Detailed information may be obtained from the Hon. Secretary of the Medical Committee. Surgeons: Mr. Claud Woakes, Dr. Furniss Potter, Dr. G. Cathcart, Mr. W. H. Kelson, and Mr. Atwood Thorne. Assistant Surgeons: Mr. Sommerville Hastings and Mr. Seccombe Hett.

THE METROPOLITAN EAR, NOSE, AND THROAT HOSPITAL.—The hospital was founded in 1838 and is situated in Grafton-street, Tottenham-court-road. The out-patient department is opened daily at 2.30 P.M. to all medical practitioners and senior students for acquiring clinical instruction and technical knowledge. Operations upon in-patients are performed on Tuesdays, Wednesdays, and Thursdays at 9.30 A.M. Fee for one month's attendance at the hospital £1 1s., and for three months £2 2s. During the forthcoming session practical demonstrations will be given by members of the staff on the diagnosis and treatment of diseases of the ear and respiratory passages. Each course may commence at any time. Consulting Surgeons: Mr. G. Saunders and Mr. J. Pickett. Surgeons: Mr. H. Pegler, Mr. F. Spicer, and Mr. W. J. Horne. Assistant Surgeons: Mr. C. Fox, Mr. B. Jones, and Mr. J. C. Potter. Anæsthetists: Mr. J. Brunton and Mr. C. N. Barton. Dentist: Mr. E. Davis.

ROYAL EAR HOSPITAL, Dean-street, Soho. (Founded 1816.)—Courses of instruction of a practical character in Diseases of the Ear and Nose are given by the members of the staff throughout the year. Clinical assistants are also appointed. The new hospital is now in full working order. Students may join at any time. For information address the Honorary Secretary of the Medical Board, Royal Ear Hospital, Dean-street, Soho. Surgeons: Mr. M. Yearsley and Mr. Richard Lake. Assistant Surgeons: Mr. W. H. Bowen, Mr. E. A. Peters, Mr. R. S. Cocke, and Mr. A. Evans. Anæsthetists: Mr. F. D. Bennett, Mr. J. H. Chaldecott, and Dr. F. E. Shipway. Dental Surgeon: Mr. F. W. Barrett. Ophthalmic Surgeon: Mr. H. W. Lyle.

ST. PETER'S HOSPITAL FOR STONE AND URINARY DISEASES, Henrietta-street, Covent-garden. Established 1860. New Hospital opened, 1882.—Honorary Surgeons: Mr. F. Swinford Edwards and Mr. P. J. Freyer. Assistant Surgeons: Mr. John Pardoe and Mr. J. W. Thomson Walker. The hospital contains 30 beds for men and 2 beds for women and children. Consultations are held and operations are performed each Wednesday and Friday at 2 P.M. Medical practitioners and students are invited to the clinical instructions which are given in the wards and out-patient department daily, and to the operations in the theatre on Wednesdays and Fridays at 2 P.M. Average beds occupied daily, 30; average out-patients seen daily, 100.

ST. JOHN'S HOSPITAL FOR DISEASES OF THE SKIN Leicester-square, W.C. Rebuilt 1905.—The in-patient department, 40 beds, is at 262, Uxbridge-road, W. The out-patient practice is open to the medical profession at the following times: Every day, from 2 to 4 P.M., and every evening (except Saturday) 6 to 8. At the afternoon clinics specially selected Clinical Demonstrations, also demonstrations on the different diseases presenting themselves in the out-patient department, followed by Lectures, will be given. The x ray department is in operation every afternoon except Saturday. The Chesterfield Lectures are given on Thursdays at 6 P.M. October to March in the lecture room at 49, Medical School and partly in the Royal Infirmary, as well as in a fever hospital a lunatic asylum, and a convalescent home. Medical and Surgical Clinical Classes are conducted in the Infirmary, which in the new buildings together with the associated hospitals at Cheadle will contain 1158 beds, and separate instruction is afforded in the elements of Medical and Surgical Physical Diagnosis, in Obstetric Medicine, Ophthalmic Surgery, and Pathological Anatomy by the different members of the staff of the Medical School and Infirmary. The following entrance scholarships are offered for award to persons of either sex proposing to enter a medical course of study at the University:—Seaton—One of £40, tenable for two years. Subjects: Greek and Latin Translation at sight, and Prose Composition. Credit given for knowledge of Mathematics (Geometry and Algebra); Elements of English Language, Literature, and History; French and German. Rogers.—One of £50, tenable for two years. Subjects as in Seaton. Dalton.—Two of £40, tenable for two years. Subjects: Geometry (Euclid I.—IV., and VI., or the subjects thereof); Algebra (as far as the Binomial Theorem, inclusive), Plane Trigonometry (to Solution of Triangles); Elementary Analytical Geometry; Conic Sections. Credit given for knowledge of Classics, Elements of English Language, Literature, and History; French and German. Cartwright.—£35 per annum, tenable for three years. Subjects as in Dalton. Dreschfeld Memorial—£30, tenable for one year. Subjects: those of July Matriculation Examination. Hulme.—£35, tenable for three years. Subjects: English Language (Grammatical Structure and Outlines of its History); English Literature (an essay on some subject of English literature); and Modern History (Outlines of English History and Geography); with at least two of the following: Latin (Translation at sight, Grammar, and Easy Composition); Greek (ditto); French (ditto); German (ditto). Credit given for knowledge of Mathematics (Geometry and Algebra). Dora Muir.—£25 per annum, tenable for three years (open to women only). Candidates may select such of the subjects as they desire from amongst those set for the other Entrance Scholarships. James Gaskill.—£35, tenable for two years. Subjects: Mathematics, Geometry (the substance of Euclid I.—IV. and VI.), Algebra (as far as the Binomial Theorem, inclusive), Plane Trigonometry (to Solution of Triangles), Elementary Mechanics, Chemistry. Credit given for knowledge of Classics, Elements of English Language, Literature, and History, and French and German. Manchester Grammar School.—£25 per annum, tenable for three years. The examinations for all these scholarships are held in the month of May. Kay-Shuttleworth (Sir James Phillips).—£30 per annum, tenable for three years. Subjects: Mathematics, Elementary Mechanics, Chemistry. Entrance Scholarships in Medicine.—One Scholarship in each year will be offered for proficiency in Arts and one for proficiency in Science. The Scholarships are of the value of £100 each, which will be set off against their fees as follows: £60 against the fees and £40 against the Infirmary fees. Platt Biological Scholarship.—£50 for one year, awarded to the candidate who shows the most promise and ability for prosecuting original research in Zoology and Botany. Dauntesey Medical Scholarships.—Two Scholarships of £35 each are open to all students preparing for a medical course who shall not have attended lectures or Laboratory courses on human anatomy or physiology, or a purely medical or surgical course in the University or any other Medical School in the United Kingdom. Candidates will be examined in Zoology, Botany, and Chemistry. Medals are awarded on the results of the various class examinations at the end of each session. A Platt Physiological Scholarship of £50 a year for two years is offered annually to the competition of persons whether previously students of the University or not. Two Platt Exhibitions, of the value of £15 each, to be competed for by first and second year students in the class of Physiology, and a Sidney Renshaw Exhibition in Physiology of the value of £15 to be competed for by second year students in Physiology. A Professor Tom Jones Memorial Exhibition of the value of £25, a Dumville Surgical Prize of £15, a Turner Medical Scholarship of £20, and a John Henry Agnew Scholarship in Diseases of Children of £30 are offered annually for competition. A Professor Tom Jones' Memorial Scholarship of £100 is awarded triennially, a Bradley Memorial Scholarship in Clinical Surgery of the value of £20 and Medical and Surgical Clinical Prizes, each of the value of 6 guineas, are open to competition each year for the best reports (with comments) of cases which have occurred in the wards of the infirmary.

THE MANCHESTER ROYAL INFIRMARY.—The medical students of the Victoria University of Manchester receive their clinical instruction at this hospital. This Infirmary, which may safely be said to be one of the finest hospitals in the kingdom, has been built on the pavilion system, near the University, and will be open for the work of the Winter Session, commencing Oct. 1st, 1908. The Infirmary will contain 592 beds. Of these 52 are allotted to the Special and Emergency Departments; the 540 remaining beds are allocated as follows: 240 for medical practice and 300 for surgical practice (180 for men and 120 for women and children). The medical side consists of five units, each unit having a testing room for the scientific investigation of morbid products and a class-room. The surgical beds are also arranged in five units, each unit having its own operation theatre, with anæsthetising, recovery, sterilising, testing, and apparatus rooms, and its own class-room attached. Of these units four on each side will be open in October. The fine educational block provides very handsomely for the wants and comforts of the students, there being separate suites of rooms for the men and the women, and also a large common reading room, a lecture theatre, and a museum. The present annual average number of in-patients is 5000, of out- and home-patients 27,000, and the list of casualties in the accident room exceeds 18,000 per annum. About 3300 operations are performed annually in the operation theatres. Associated with the Infirmary are: the Convalescent Hospital at Cheadle, containing 136 beds; and the Royal Lunatic Hospital at Cheadle, accommodating with its branches 430 patients. The Associated Hospitals thus contain 1158 beds and are under the same management. Women students will be admitted to the practice of the Infirmary on the same terms as men. A valuable Medical Library is accessible to students for the purpose of reference. In addition to the list of scholarships tabulated in another column, two Entrance Scholarships in Medicine of the value of £100 each are offered annually by the Council of the Manchester University and the Medical Board of the Manchester Royal Infirmary for proficiency in Arts and Science subjects respectively. The Bradley Memorial Scholarship in Clinical Surgery, value £20, is offered annually in the Summer Session. Gentlemen are eligible who are in their fifth or sixth year of study, have completed their dresserships, and have spent two years in clinical work at the Manchester Royal Infirmary. One Medical and one Surgical Clinical Prize of the value of 6 guineas are offered annually. (The other scholarships and prizes are in the College Syllabus.) Annual appointments may be held by those who have attended the practice of the infirmary: a Surgical Registrar (£80); a Pathological Registrar (£100); a Medical Registrar (£70); a Surgical Tutor (£30); a Director of the Clinical Laboratory (£200); Assistant Director of the Clinical Laboratory (£40); an Assistant Medical Officer (£105); Three Assistant Surgical Officers (£35 each); an Anæsthetist (£50); an Assistant Anæsthetist (£50); a Medical Officer for home patients (£150). A Third Anæsthetist is appointed for six months (30 guineas) and an Accident House Surgeon is appointed for three months (20 guineas). The following resident appointments are also made annually: Resident Medical Officer (£150); Resident Surgical Officer (£150); Resident Medical Officer at the Convalescent Hospital at Cheadle (£150). An Assistant Medical Officer at this hospital is appointed every six months at a salary of £80 per annum. The following unpaid appointments are open to those who have attended the practice of the Infirmary:—House Surgeons: Two House Surgeons are appointed every three months for a term of six months. House Physicians: Two House Physicians are appointed every three months for a term of six months. The House Surgeons and House Physicians and Resident Assistant at Cheadle must possess registrable qualifications. Consulting Physician: Dr. Henry Simpson. Consulting Surgeons: Mr. Walter Whitehead and Mr. James Hardie. Physicians: Dr. Graham Steell, Dr. J. S. Bury, Dr. A. T. Wilkinson, Dr. E. S. Reynolds, and Dr. G. R. Murray. Assistant Physicians: Dr. R. T. Williamson, Dr. E. M. Brockbank, and Dr. E. N. Cunliffe. Pathologist: Dr. J. Lorrain Smith. Consulting Obstetric Physician: Dr. Lloyd Roberts. Gynæcological Surgeon: Dr. Archibald Donald. Assistant Gynæcological Surgeon: Dr. W. E.

Dental Surgeons: Mr. A. Jones and Mr. E. Rhodes. Honorary Anæsthetists: Mr. G. S. Haynes and Mr. G. F. Rogers.

UNIVERSITY OF DURHAM: THE COLLEGE OF MEDICINE, Newcastle-upon-Tyne.—A new wing has been added to accommodate the departments of physiology and bacteriology. It also contains a students' gymnasium and a set of Students' Union rooms. The new Royal Victoria Infirmary, containing upwards of 400 beds, was opened by His Majesty King Edward VII. in 1906. In the new infirmary adequate accommodation will be provided for the study of the various special subjects, in addition to the ordinary clinical work. The following Scholarships and Prizes are awarded annually:—Four University of Durham Scholarships, value £25, tenable for four years, for proficiency in Arts, awarded to full students in their first year. The Pears Scholarship, value £50 a year, tenable for three years (when vacant). The Masonic Scholarship, value £15 a year, tenable for three years (when vacant). The Dickinson Scholarship, value interest of £400, and a Gold Medal, for Medicine, Surgery, Midwifery, and Pathology. The Tulloch Scholarship, value the interest of £400, for Anatomy, Physiology, and Chemistry. The Charlton Scholarship, value the interest of £700, for Medicine. The Gibb Scholarship, value the interest of £500, for Pathology. The Goyder Memorial Scholarship (at the Infirmary), value the interest of £325, for Clinical Medicine and Clinical Surgery. The Luke Armstrong Memorial Scholarship, value the interest of £680, for Comparative Pathology. The Stephen Scott Scholarship in Surgery, value the interest of £1000. Heath Scholarship: The late Dr. George Yeoman Heath, President of the University of Durham College of Medicine, bequeathed the sum of £4000 to found a Scholarship in Surgery, the interest to be awarded every second year; the next award will be in 1910. The Gibson Prize, interest on £225, in the department of Midwifery and Diseases of Women and Children. The Turnbull Prize and Medal for Surface Anatomy. At the end of each session Prizes of Books are awarded in each of the regular classes. Assistant Demonstrators of Anatomy, Prosectors, and Assistant Demonstrators of Physiology and Pathology are elected yearly. Pathological Assistants, Assistants to the Dental Surgeon, Assistants in the Eye Department, Throat and Ear Department, and Skin Department, Clinical Clerks, and Dressers are appointed every three months.

NEWCASTLE-UPON-TYNE ROYAL VICTORIA INFIRMARY.—This Infirmary was founded in 1751 but has been recently rebuilt, the new hospital being opened in 1906. The number of beds is 410. The number of in-patients annually is 6500 and of out-patients 90,000. The medical students of the University of Durham attend the practice of this hospital. Clinical Lectures are delivered by the Physicians and Surgeons weekly and ward demonstrations are given daily. Tutorial classes are held by the Assistant Physicians and Assistant Surgeons weekly, and demonstrations are given in the several out-patient departments daily. Pathological demonstrations are given by the Pathologist daily or as opportunity occurs, and in the new buildings nothing has been spared in perfecting scientific equipment. In addition to medical and surgical in-patient and out-patient departments the following special departments are fully equipped for teaching students: Ophthalmic, Throat and Ear, Skin, Orthopædic, Gynæcological, Electrical, and Bacteriological. The hospital building contains the following laboratories: 1. Special Pathological Laboratory, attached to the post-mortem rooms. 2. Bacteriological Laboratory, in which all clinical bacteriological investigations are carried out—opsonic indices estimated with a view to treatment by vaccines and serums, &c. 3. There is in addition a Clinical Laboratory attached to each ward and to the out-patient department. There are five operating theatres in use in the hospital, three large theatres, a smaller one for emergencies, and an out-patient theatre. The surgical practice is especially good; more than 4000 surgical operations were performed in the last 12 months. Every facility is given to students to take out the full or any part of the hospital curriculum, and clerkships or assistantships in any of the several special departments are open to undergraduates or graduates for periods of from one to three months. There are 11 resident medical and surgical officers, two of whom are paid, and preference for these appointments is given to students who have fulfilled their curriculum in the hospital. The sessions open on May 1st and Oct. 1st of each year. Applications for detailed information should be made to the Dean, Mr. H. B. Angus, at the hospital. The following is the staff of the hospital:—Physicians: Dr. David Drummond, Dr. Thomas Oliver, Dr. G. R. Murray, and Dr. T. Beattie. Assistant Physicians: Dr. W. E. Hume, Dr. Horsley Drummond, Mr. Alfred Parkin, and Dr. George Hall. Surgeons: Mr. J. Rutherford Morison, Mr. A. M. Martin, Mr. H. B. Angus, and Mr. J. V. W. Rutherford. Assistant Surgeons: Mr. W. G. Richardson, Mr. J. W. Leech, Mr. John Clay, and Mr. G. G. Turner. Ophthalmic Surgeon: Mr. J. D. Wardale. Throat and Ear Department: Surgeon: Mr. G. W. Ridley; Assistant Surgeon: Mr. S. H. Whillis. Gynæcological Department: Dr. R. P. R. Lyle. Skin Department: Physician: Dr. Robert A. Bolam; Assistant Physician: Dr. D. W. Patterson. Orthopædic Department: Mr. A. M. Martin. Electrical Department: Dr. W. D. Arnison. Pathologist: Dr. George Hall. Bacteriologist: Dr. H. J. Slade. Pathological and Analytical Chemist: Mr. P. P. Bedson, D.Sc. Anæsthetists: Dr. R. Younger, Dr. F. G. Armstrong, Dr. W. J. Phillips, and Dr. H. H. Markham. Medical Registrars: Dr. W. E. Moore-Ede and Dr. W. Simpson. Surgical Registrars: Mr. J. W. Heslop and Mr. J. O. Stewart.

There are other institutions at which the student of medicine of the University of Durham can receive clinical instruction. Practical Midwifery can be studied at the Newcastle Lying-in Hospital. Instruction is given in Psychological Medicine at the Northumberland County Asylum, Morpeth. A special course of instruction is given in the City Hospital for Infectious Diseases by the Superintendent, the City Officer of Health, Mr. H. E. Armstrong.

NORTHUMBERLAND, DURHAM, AND NEWCASTLE INFIRMARY FOR DISEASES OF THE EYE, St. Mary's-place, Newcastle-on-Tyne.—Consulting Surgeon: Mr. F. Page. Staff Surgeons: Mr. A. S. Percival and Mr. H. P. Bennett. Assistant Surgeons: Mr. J. B. Hartley and Mr. Stanley Robson. Honorary Anæsthetists: Dr. O. W. Ogden and Mr. T. H. Livingstone. Matron: Miss C. Crump. Secretary: Mr. Richard Smith, 61, Westgate-road, Newcastle-on-Tyne. Out-patients for 1907, 7067; in-patients, 330.

THE VICTORIA UNIVERSITY OF MANCHESTER: MEDICAL FACULTY.—This medical school is located in a large building, which forms a part of the University. It is provided with large dissecting-rooms, physiological laboratories, private laboratories, and work-rooms, besides lecture-rooms, a museum, and a library. In order to give the fullest possible opportunities for teaching and investigation in the departments of Anatomy, Physiology, Pathology, and Materia Medica, a large extension of the school buildings was made in 1895. The greater part of the new buildings is devoted to the departments of physiology, pathology, toxicology, anatomy, and public health. The physiological department occupies more than half of the new buildings, and includes a large lecture theatre, accommodating 350 students, with preparation and diagram rooms adjacent to it, and a research laboratory fitted with the necessary apparatus for the use of advanced students, research scholars, or practitioners of medicine undertaking the investigation of some special subject. In the new pathological laboratories ample provision is made for the teaching of pathology and bacteriology and for the prosecution of original research. In the toxicological department there is a large laboratory, capable of accommodating 50 students, lighted from both sides and also from the roof, completely equipped with all that is necessary for the practical teaching of toxicology; also a small laboratory for private research, containing the apparatus and fittings necessary for investigations in toxicological chemistry. In the public health department suitable laboratory accommodation is provided for the study of sanitary chemistry, physics, and practical bacteriology in the departments of chemistry and physics and in that of pathology. A large room is provided in the new buildings for a museum of apparatus, models, plans, and other sanitary appliances for the practical instruction of the students, together with a special library of works on State medicine, hygiene, vital statistics, and sanitary engineering. In addition, a large lecture theatre for general purposes, accommodating 250 students, has been provided, and the existing accommodation for students is supplemented by the provision of a larger common room. The more strictly practical departments of medical study are taught partly in the

Tropical Medicine and Sanitation delivered by the Professor of Tropical Medicine at the University; (2) of additional lectures on Cytology, Special African Diseases, and Special Indian Diseases, delivered at the University; (3) of systematic lectures and demonstrations on Tropical Pathology, Parasitology, and Bacteriology by the Walter Myers Lecturer at the University; (4) of similar instruction on Medical Entomology by the Lecturer on Economic Entomology at the University; and (5) of clinical lectures and demonstrations delivered at the Royal Southern Hospital by the Physician in charge of the Tropical Ward, the Professor, and the Walter Myers Lecturer. The instruction given occupies six hours a day for five days a week during the course. Teaching under headings 3 and 4 above is delivered in the laboratory of the school at the University, which contains accommodation for 30 students, with all necessary appurtenances, including a well equipped museum, a class library, and access to the general departmental library. Teaching under heading 5 is given in the tropical ward and the attached clinical laboratories of the Royal Southern Hospital on two or three afternoons a week. At the end of each course an examination is held by the University for its diploma of Tropical Medicine (D.T.M.), which is open only to those who have been through the course of instruction of the school. The examination lasts three days and consists (1) of three papers on Tropical Medicine, Tropical Pathology, and Tropical Sanitation and Entomology respectively; (2) of a clinical examination; and (3) of an oral examination. The results are declared as soon as possible afterwards. Those who do not wish to undertake the examination are given a certificate of attendance if their attendance has been satisfactory. Accommodation for a limited number of students may be had at the Hall of Residence (for terms apply to the Warden, 44, Upper Parliament-street). The fee for the full course of instruction is 10 guineas, with an extra charge of 10*s.* for the use of a microscope if required. The fee for the examination is 5 guineas. Applications should be made to the Dean of the Medical Faculty, University of Liverpool, from whom prospectuses may be obtained. Two University Fellowships of £100 a year each are open to students of the school, amongst others. Accommodation for research work is to be had both at the University Laboratory of the school and at its Research Laboratories at Runcorn (16 miles distant from Liverpool). Since it was instituted nine years ago the school has employed 25 different investigators paid out of its funds and has despatched to the tropics 17 scientific expeditions, many of the workers having been taken from among its students. The work done by them has been published in 21 special memoirs with many plates and figures, besides text-books and numerous articles in the scientific press. From the beginning of this year, however, the memoirs have been succeeded by the "Annals of Tropical Medicine and Parasitology," published by the Committee and open to outside contributors (apply to the Secretary, B 10, Exchange-buildings, Liverpool). The Mary Kingsley Medal is awarded by the school for distinguished work in connexion with Tropical Medicine, and has been given to Sir David Bruce, Professor Koch, Dr. Laveran, and Sir Patrick Manson.

The Liverpool Clinical School of Medicine consists, as we have already said, of four general hospitals and five special hospitals, which in the aggregate contain 1127 beds. The former are the Royal Infirmary, the David Lewis Northern Hospital, the Royal Southern Hospital, and the Stanley Hospital. The latter are the Eye and Ear Infirmary, the Hospital for Women, the Infirmary for Children, St. Paul's Eye and Ear Hospital, and St. George's Hospital for Skin Diseases.

School of Veterinary Medicine.—A school of Veterinary Medicine in connexion with the University was opened in October, 1904; full courses of instruction for the Veterinary Curriculum will be provided and students will be prepared for the M.R.C.V.S. A diploma in Veterinary Hygiene is now granted by the University.

Public Health Department.—This is located in a separate building known as Ashton Hall in which full courses of instruction are given to D.P.H. students for the D.P.H. of the University.

Special Diplomas.—The University has instituted diplomas in Anatomy, Bacteriology, Bio-chemistry, and Parasitology. A special course of study of three terms' duration is required in the subject chosen for the diploma and allied subjects.

School of Pharmacy.—Complete courses of instruction are provided adapted to the requirements of candidates preparing for either the Minor or Major Examinations of the Pharmaceutical Society of Great Britain.

Prospectuses and further information may be had on application to the Dean of the Faculty of Medicine, University of Liverpool.

Royal Infirmary Staff.—Consulting Physicians: Dr. A. T. H. Waters, Dr. T. R. Glynn, and Dr R. Caton. Physicians: Sir James Barr, M.D., Dr. T. R. Bradshaw, and Dr. J. H. Abram. Assistant Physicians: Dr. R. J. M. Buchanan and Dr. E. Glynn. Consulting Surgeon: Mr. R. Parker. Surgeons: Mr. F. T. Paul, Mr. G. G. Hamilton, and Mr. R. A. Bickersteth. Assistant Surgeons: Mr. W. T. Thomas, Mr. T. C. Littler-Jones, and Mr. R. E. Kelly. Gynæcological Surgeon: Mr. T. B. Grimsdale. Assistant Gynæcological Surgeon: Mr. W. B. Bell. Ophthalmic Surgeon: Mr. T. H. Bickerton. Surgeon to the Throat Department: Mr. J. M. Hunt. Physician to the Skin Department: Dr. L. Roberts. Dental Surgeon: Mr. E. J. M. Phillips. Pathologists: Sir R. W. Boyce and Dr. E. Glynn. Anæsthetists: Mr. W. Fingland, Mr. F. W. Bailey, Mr. H. Armstrong, and Mr. A J. O'Leary.

David Lewis Northern Hospital Staff.—Physicians: Dr. T. Bushby and Dr. W. B. Warrington. Consulting Surgeons: Mr. W. M. Campbell and Mr. C. Puzey. Surgeons: Mr. D. Harrison, Mr. R. Murray, and Mr. K. W. Monsarrat. Consulting Ophthalmic Surgeon: Mr. G. E. Walker. Radiologist: Dr. A. N. Walker. Surgeon to the Orthopædic Department: Mr. E. Broad. Dental Surgeon: Mr. W. Matthews. Pathologists: Dr. H. L. Murray and Dr. J Owen. Bacteriologist: Dr. C. A. Hill. Anæsthetists: Mr. G. B. Robinson, Mr. R. Stevenson, and Mr. V. C. de Boinville.

Royal Southern Hospital Staff.—Consulting Physicians: Dr. J. Cameron and Dr. W. Williams. Consulting Surgeon: Mr. R. Hamilton. Physicians: Dr. W. Carter, Dr. J. W. MacAllister, and Dr. J. L. Roberts. Surgeons: Mr. W. Alexander, Mr. R. Jones, and Mr. G. P. Newbolt. Physician to the Skin Department: Dr. F. H. Barendt. Consulting Ophthalmic Surgeon: Mr. R Williams. Consulting Aural Surgeon: Mr. G. C. Lee. Consulting Physician for Tropical Diseases: Dr. R. Ross. Consulting Surgeon to the Throat Department: Mr. W. Permewan. Radiologist: Dr. D. Morgan. Dental Surgeon: Mr. J Royston. Anæsthetists: Mr. A. J. Evans, Mr. D. M. Alexander, and Mr. F. M. Gardner-Medwin.

Stanley Hospital Staff.—Consulting Physician: Dr. R. J. Richardson. Consulting Surgeons: Mr. J. Bark and Mr. K. A. Grossmann. Physicians: Dr. W. Whitford, Dr. A. G. Gullan, and Dr. J. Hay. Surgeons: Mr. F. C. Larkin and Mr. D. Douglas-Crawford. Ophthalmic Physician: Dr. R. J. Hamilton. Laryngologist: Mr. J. Bark. Assistant Laryngologist: Mr. J. E. McDougall. Physician for Skin Diseases: Dr. W. Whitford. Dentist: Mr. J. H. Burroughs.

THE UNIVERSITY OF BIRMINGHAM: MEDICAL FACULTY.—The medical students of the University receive their clinical instruction by attending the amalgamated practice of the General Hospital and the Queen's Hospital, details of which follow. The students can be members of the University Club, the University Athletic Club, and the University Volunteer Company, while they possess a guild—the Guild of Undergraduates—which is designed to be a recognised medium of communication between the teachers and the taught. The University Medical Society and the Dental Students' Society also offer opportunities of coöperation for mutual benefit. The scholarships and prizes are tabulated in another column.

The clinical instruction of the Birmingham medical students is carried on under the direction of the Birmingham Clinical Board. The hospitals present an excellent field for clinical work, possessing more than 450 beds, treating annually 8000 in-patients and 80,000 out-patients. The students spend part of their curriculum in each hospital, and thus have every opportunity of acquiring a varied, full, and practical knowledge of their professional work. The curriculum is adapted in the first place to meet the needs of the students of the University of Birmingham, but it is also well adapted to the requirements of students preparing for the examinations of all other universities and licensing bodies. At the General Hospital there are open to the students the following appointments: A resident medical officer, elected annually (£70); a resident surgical officer, elected annually and eligible for re-election for three years (£100): a resident pathologist, elected for six months (£50): three surgical casualty

Fothergill. Surgeons: Mr. F. A. Southam, Mr. G. A. Wright, Mr. William Thorburn, and Mr. J. E. Platt. Assistant Surgeons: Mr. J. W. Smith, Mr. A. H. Burgess, and Mr. J. H. Ray. Ophthalmic Surgeon: Dr. Hill Griffith. Aural Surgeon: Dr. William Milligan. Anæsthetist: Mr. Alex. Wilson. Consulting Dental Surgeon: Mr. G. W. Smith. Dental Surgeon: Mr. W. A. Hooton. Pathological Registrar: Dr. W. B. Anderton. Medical Registrar: Dr. A. Ramsbottom. Surgical Registrar: Mr. W. R. Douglas. Director of the Clinical Laboratory: Dr. G. E. Loveday. Administrators of Anæsthetics: Mr. W. J. S. Bythell, Mr. A. F. Thompson, and Mr. S R. Wilson. Assistant Medical Officer for Out-patients: Dr. A. Ramsbottom. Assistant Surgical Officers for Out-patients: Mr. C. Roberts, Mr. E. D. Telford, and Mr. P. R. Wrigley. Medical Officer for Home Patients: Dr. George Ashton. General Superintendent and Secretary: Mr. Walter G. Carnt. The Winter Session commences Oct. 1st.

There are other institutions at which the student of medicine of the University of Manchester can receive clinical instruction.

MANCHESTER CHILDREN'S HOSPITAL, Pendlebury and Gartside-street, Manchester.—The hospital contains 168 beds and 24 in the Convalescent Home, St. Anne's-on-Sea. The medical staff visit the hospital daily at 10 A.M. Clinical instruction is given by the medical staff at the Hospital and Dispensary. Out-patients are seen daily at 9 A.M. at the new Out-patient Department, Gartside-street, Manchester. Physicians: Dr. Hutton and Dr. Heywood. Surgeons: Mr. J. Howson Ray, Mr. E. D. Telford, and Mr. C. Roberts. Honorary Consulting Surgeon: Mr. G. A. Wright. Honorary Consulting Pathologist: Professor R. Lorrain Smith. Anæsthetist: Mr. Harold Snape. Honorary Surgeon for Throat, Nose, and Ear Diseases: Mr. F. H. Westmacott. Pathologist: Dr. W. Mair. Honorary Dental Surgeon: Mr. Barron J. Rodway. Resident Medical Officers: Mr. H. Gibbons Ward and Mr. F. Hartley. Medical Officers at the Dispensary: Dr. A. H. Norris and Mr. H. Gibbons Ward. During 1907 there were 2007 in-patients and 27,879 new out-patients were under treatment at the Dispensary, and there were 93,153 attendances made by out-patients. Secretary: Mr. H. J. Eason.

THE MANCHESTER NORTHERN HOSPITAL FOR WOMEN AND CHILDREN, Park place, Cheetham-hill-road, Manchester.—The hospital contains 70 beds. Out-patients are seen daily from 8.30 to 10 A.M. Honorary Consulting Physicians: Dr. W. N. Maccall Dr. S. Holgate Owen, and Dr. T. C. Railton. Honorary Consulting Surgeons: Mr. James Hardie and Mr. Frederick A. Southam. Honorary Physicians for Women: Dr. Samuel Buckley and Dr. T. Arthur Helme. Honorary Surgeon for Women: Mr. Arnold W. W. Lea. Honorary Physician: Dr. J. J. Cox. Honorary Assistant Physicians for Children: Dr. C. H. Melland and Dr. C. C. Heywood. Honorary Surgeon for Children: Mr. Philip Roscoe Wrigley Anæsthetists: Mr. G. A. Barrow and Dr. H. R Clarke. Pathologist: Dr. J. Garvie McNaughton. Assistant Medical Officers: Dr. A. W. Lilley and Mr. R. W. Walsh. Honorary Dentist: Mr. W. A. Hooton. House Surgeon: Mr. Robert E Collins.

THE UNIVERSITY OF LIVERPOOL: FACULTY OF MEDICINE:—

Medical School Buildings.—Spacious and well-equipped class-rooms and laboratories have been erected for the practical study of all the important scientific subjects which form the basis of medicine. Medical research has also been endowed with several new laboratories in which students can pursue research work after graduation. All the laboratories and class-rooms are situated close together, communicating with one another, and are made up of four large blocks of buildings which form one side of the College quadrangle. The most recent additions are the Johnston Laboratories for Experimental Medicine, Bio-chemistry, and Comparative Pathology and the new building for Anatomy, Surgery, Toxicology, Ophthalmology and Dental subjects. The departments of Physiology and Pathology are accommodated in the large block provided by the generosity of the late Rev. S. A. Thompson Yates in 1898. The Anatomical department is situated in a separate block and has a complete suite of rooms, including a large and well-stocked museum and a well-lighted dissecting room on the upper floor measuring 70 by 40 feet.

Hospitals.—The Clinical School of the University now consists of four general hospitals—the Royal Infirmary, the David Lewis Northern Hospital, the Royal Southern Hospital, and the Stanley Hospital; and of five special hospitals—the Eye and Ear Infirmary, the Hospital for Women, the Infirmary for Children, St. Paul's Eye and Ear Hospital, and St. George's Hospital for Skin Diseases. These hospitals contain in all a total of 1127 beds. The organisation of these hospitals to form one teaching institution provides the medical student and the medical practitioner with a field for clinical education and study which is unrivalled in extent in the United Kingdom. All the hospitals are within easy access from the University; those which are situated at any distance are readily reached by the tramway service of the city. The period of hospital practice extends over the last three years of medical study. During the first two years of this period no student will be permitted to change his attendance from one general hospital to another except at the commencement of an academic term. It is a regulation of the school that not more than five of the six terms of these two years shall be spent at any single general hospital During the final year of hospital practice a student is permitted to attend the practice of all the general hospitals without restriction. The regulations demand only that his attendance shall be regular and to the satisfaction of the hospital's board. There are a large number of appointments to house physicianships and surgeonships both at the general and special hospitals which are open to qualified students of the school. These appointments (20) in most cases carry salaries ranging from £60 to £100 per annum. Applications for further information regarding the Medical Curriculum should be addressed to the Dean of the Faculty of Medicine.

Fellowships and Scholarships.—Fellowships, scholarships, and prizes of over £1000 are awarded annually. A Holt Fellowship in Pathology and Surgery of the value of £100 for one year is awarded annually by the Medical Faculty to a senior student possessing a medical qualification. The successful candidate is required to devote a year to tutorial work and investigation in the pathological department. A Holt Fellowship in Physiology, awarded under similar conditions of the value of £100 for one year. A Robert Gee Fellowship in Anatomy, awarded under similar conditions, also of the value of £100 for one year. An Alexander Fellowship for Research in Pathology of the annual value of £100, renewable. A Johnston Colonial Fellowship in Pathology and Bacteriology (£100 a year, renewable). A John W. Garrett International Fellowship in Physiology and Pathology (£100 a year, renewable). An Ethel Boyce Fellowship in Gynæcological Pathology (£100 a year, renewable). A Stopford Taylor Fellowship (£100 a year, renewable) in Dermatology. A Thelwall Thomas Fellowship (£100 a year, renewable) in Surgical Pathology. A further scholarship in Surgical Pathology (£50 per annum, renewable). Two Lyon Jones Scholarships of the value of £21 each for two years are awarded annually—a Junior Scholarship, open at the end of the first year of study to Liverpool University students, on the subjects of the First M.B. Examinations, and a Senior Scholarship, open to all students in the school at the end of the second or third year of study, on the subjects of Anatomy, Physiology, and Therapeutics. A University Scholarship of £25 awarded on the results of the second examination for the degree The Derby Exhibition of £15 for one year is awarded in Clinical Medicine and Surgery in alternate years. Students may compete in their fourth and fifth years. The Torr Gold Medal in Anatomy, the George Holt medal in Physiology, the Kanthack Medal in Pathology, the Robert Gee Book Prize, of the value of £5, for Children's Diseases, and numerous Class Prizes are awarded annually.

Entrance Scholarships.—Two Robert Gee Entrance Scholarships of the value each of £25 per annum for two years are offered annually for competition. The holder is required to take out the Course for the University Degrees in Medicine. Communications should be addressed to the Dean, Mr. K W. Monsarrat, The University, Liverpool.

School of Tropical Medicine.—The school is affiliated with the University of Liverpool and the Royal Southern Hospital of Liverpool. Two complete courses of instruction are given every year, commencing in January and October and lasting for about 13 weeks. Each course consists (1) of a systematic series of lectures on

Tropical Medicine and Sanitation delivered by the Professor of Tropical Medicine at the University; (2) of additional lectures on Cytology, Special African Diseases, and Special Indian Diseases, delivered at the University; (3) of systematic lectures and demonstrations on Tropical Pathology, Parasitology, and Bacteriology by the Walter Myers Lecturer at the University; (4) of similar instruction on Medical Entomology by the Lecturer on Economic Entomology at the University; and (5) of clinical lectures and demonstrations delivered at the Royal Southern Hospital by the Physician in charge of the Tropical Ward, the Professor, and the Walter Myers Lecturer. The instruction given occupies six hours a day for five days a week during the course. Teaching under headings 3 and 4 above is delivered in the laboratory of the school at the University, which contains accommodation for 30 students, with all necessary appurtenances, including a well equipped museum, a class library, and access to the general departmental library. Teaching under heading 5 is given in the tropical ward and the attached clinical laboratories of the Royal Southern Hospital on two or three afternoons a week. At the end of each course an examination is held by the University for its diploma of Tropical Medicine (D.T.M.), which is open only to those who have been through the course of instruction of the school. The examination lasts three days and consists (1) of three papers on Tropical Medicine, Tropical Pathology, and Tropical Sanitation and Entomology respectively; (2) of a clinical examination; and (3) of an oral examination. The results are declared as soon as possible afterwards. Those who do not wish to undertake the examination are given a certificate of attendance if their attendance has been satisfactory. Accommodation for a limited number of students may be had at the Hall of Residence (for terms apply to the Warden, 44, Upper Parliament-street). The fee for the full course of instruction is 10 guineas, with an extra charge of 10s. for the use of a microscope if required. The fee for the examination is 5 guineas. Applications should be made to the Dean of the Medical Faculty, University of Liverpool, from whom prospectuses may be obtained. Two University Fellowships of £100 a year each are open to students of the school, amongst others. Accommodation for research work is to be had both at the University Laboratory of the school and at its Research Laboratories at Runcorn (16 miles distant from Liverpool). Since it was instituted nine years ago the school has employed 25 different investigators paid out of its funds and has despatched to the tropics 17 scientific expeditions, many of the workers having been taken from among its students. The work done by them has been published in 21 special memoirs with many plates and figures, besides text-books and numerous articles in the scientific press. From the beginning of this year, however, the memoirs have been succeeded by the "Annals of Tropical Medicine and Parasitology," published by the Committee and open to outside contributors (apply to the Secretary, B 10, Exchange-buildings, Liverpool). The Mary Kingsley Medal is awarded by the school for distinguished work in connexion with Tropical Medicine, and has been given to Sir David Bruce, Professor Koch, Dr. Laveran, and Sir Patrick Manson.

The Liverpool Clinical School of Medicine consists, as we have already said, of four general hospitals and five special hospitals, which in the aggregate contain 1127 beds. The former are the Royal Infirmary, the David Lewis Northern Hospital, the Royal Southern Hospital, and the Stanley Hospital. The latter are the Eye and Ear Infirmary, the Hospital for Women, the Infirmary for Children, St. Paul's Eye and Ear Hospital, and St. George's Hospital for Skin Diseases.

School of Veterinary Medicine.—A school of Veterinary Medicine in connexion with the University was opened in October, 1904; full courses of instruction for the Veterinary Curriculum will be provided and students will be prepared for the M.R.C.V.S. A diploma in Veterinary Hygiene is now granted by the University.

Public Health Department.—This is located in a separate building known as Ashton Hall in which full courses of instruction are given to D.P.H. students for the D.P.H. of the University.

Special Diplomas.—The University has instituted diplomas in Anatomy, Bacteriology, Bio-chemistry, and Parasitology. A special course of study of three terms' duration is required in the subject chosen for the diploma and allied subjects.

School of Pharmacy.—Complete courses of instruction are provided adapted to the requirements of candidates preparing for either the Minor or Major Examinations of the Pharmaceutical Society of Great Britain.

Prospectuses and further information may be had on application to the Dean of the Faculty of Medicine, University of Liverpool.

Royal Infirmary Staff.—Consulting Physicians: Dr. A. T. H. Waters, Dr. T. R. Glynn, and Dr R. Caton. Physicians: Sir James Barr, M.D., Dr. T. R. Bradshaw, and Dr. J. H. Abram. Assistant Physicians: Dr. R. J. M. Buchanan and Dr. E. Glynn. Consulting Surgeon: Mr. R. Parker. Surgeons: Mr. F. T. Paul, Mr. G. G. Hamilton, and Mr. R. A. Bickersteth. Assistant Surgeons: Mr. W. T. Thomas, Mr. T. C. Littler-Jones, and Mr. R. E. Kelly. Gynæcological Surgeon: Mr. T. B. Grimsdale. Assistant Gynæcological Surgeon: Mr. W. B. Bell. Ophthalmic Surgeon: Mr. T. H. Bickerton. Surgeon to the Throat Department: Mr. J. M. Hunt. Physician to the Skin Department: Dr. L. Roberts. Dental Surgeon: Mr. E. J. M. Phillips. Pathologists: Sir R. W. Boyce and Dr. E. Glynn. Anæsthetists: Mr. W. Fingland, Mr. F. W. Bailey, Mr. H. Armstrong, and Mr. A. J. O'Leary.

Fellowships and Scholarships.—Fellowships, scholarships, and prizes of over £1000 are awarded annually. A Holt Fellowship in Pathology and Surgery of the value of £100 for one year is awarded annually by the Medical Faculty to a senior student possessing a medical qualification. The successful candidate is required to devote a year to tutorial work and investigation in the pathological department. A Holt Fellowship in Physiology, awarded under similar conditions of the value of £100 for one year. A Robert Gee Fellowship in Anatomy, awarded under similar conditions, also of the value of £100 for one year. An Alexander Fellowship for Research in Pathology of the annual value of £100, renewable. A Johnston Colonial Fellowship in Pathology and Bacteriology (£100 a year, renewable). A John W. Garrett International Fellowship in Physiology and Pathology (£100 a year, renewable). An Ethel Boyce Fellowship in Gynæcological Pathology (£100 a year, renewable). A Stopford Taylor Fellowship (£100 a year, renewable) in Dermatology. A Thelwall Thomas Fellowship (£100 a year, renewable) in Surgical Pathology. A further scholarship in Surgical Pathology (£50 per annum, renewable). Two Lyon Jones Scholarships of the value of £21 each for two years are awarded annually—a Junior Scholarship, open at the end of the first year of study to Liverpool University students, on the subjects of the First M.B. Examinations, and a Senior Scholarship, open to all students in the school at the end of the second or third year of study, on the subjects of Anatomy, Physiology, and Therapeutics. A University Scholarship of £25 awarded on the results of the second examination for the degree The Derby Exhibition of £15 for one year is awarded in Clinical Medicine and Surgery in alternate years. Students may compete in their fourth and fifth years. The Torr Gold Medal in Anatomy, the George Holt medal in Physiology, the Kanthack Medal in Pathology, the Robert Gee Book Prize, of the value of £5, for Children's Diseases, and numerous Class Prizes are awarded annually.

Entrance Scholarships.—Two Robert Gee Entrance Scholarships of the value each of £25 per annum for two years are offered annually for competition. The holder is required to take out the Course for the University Degrees in Medicine. Communications should be addressed to the Dean, Mr. K W. Monsarrat, The University, Liverpool.

School of Tropical Medicine.—The school is affiliated with the University of Liverpool and the Royal Southern Hospital of Liverpool. Two complete courses of instruction are given every year, commencing in January and October and lasting for about 13 weeks. Each course consists (1) of a systematic series of lectures on and Dr. W. H. M. Telling. Consulting Obstetric Physician: Dr. J. Braithwaite. Obstetric Physician: Dr. J. B. Hellier. Consulting Surgeon: Mr. C. G. Wheelhouse, Mr. T. P. Teale, Mr. T. R. Jessop, and Mr. A. W. M. Robson. Surgeons: Mr. E. Ward, Mr. H. Littlewood, Mr. R. L. Knaggs, and Mr. B. G. A. Moynihan. Assistant Surgeons: Mr. W. Thompson and Mr. J. F. Dobson. Consulting Surgeon to the Eye and Ear Department: Mr. J. A. Nunneley. Surgeons: Mr. H. S. Walker and Mr. A. L. Whitehead. Assistant Surgeon: Mr. G. C. Hayes. Consulting Dental Surgeon: Mr. T. S. Carter. Dental Surgeon: Mr. J. B. Horden. Anæsthetists: Mr. D. Seaton, Mr. W. C. Mayo, Mr. J. Nicholson, Mr. T. B. Rowling, Mr. F. J. Birks, and Mr. St.Clair Stockwell.

UNIVERSITY OF SHEFFIELD: FACULTY OF MEDICINE.—The new buildings of the University opened in 1905 are situated at the west end of the city, adjoining Weston Park, and the Medical department occupies the entire north wing of the University quadrangle. The University is within easy reach of the various hospitals with which it is connected for clinical purposes. These are as follows: The Royal Infirmary, containing 255 beds, with an annual average number of over 3800 in-patients, over 8000 out-patients, and over 21,000 casualties; the Royal Hospital, with 172 beds, and an annual number of 2500 in-patients, over 7000 out-patients, and over 14,000 casualties; and the Jessop Hospital for Diseases of Women, with 80 beds, nearly 500 in-patients, and over 2000 out-patients; also a Maternity department, with over 250 in-patients per annum and over 700 out-patient cases attended. Special courses on Fevers are held at the City Fever Hospitals (547 beds) and on Mental Diseases at the South Yorkshire Asylum (1610 beds). For purposes of clinical practice the practices of the Royal Infirmary and Royal Hospital are amalgamated, giving a total of 427 beds for the treatment of medical, surgical, and special cases. There are special departments for the treatment of Diseases of the Eye at such institution, with wards assigned to them. In addition to these the Royal Infirmary has special departments for the treatment of Diseases of the Skin and Ear, with beds assigned to them, whilst at the Royal Hospital there are special out-patient departments for Diseases of the Throat, Ear, Skin, Orthopædics, and Mental Diseases. During the last year over 6000 patients passed through the wards of the two institutions, while those attending as out-patients numbered over 45,000. The medical and surgical staffs attend daily and give clinical instruction in the wards and out-patient rooms at stated times. Clinical lectures in Medicine and Surgery are given weekly at stated times. Instruction in the practical administration of anæsthetics is given at either institution by the Anæsthetists. The laboratories and lecture rooms connected with the subjects of the first and second examinations—namely, chemistry, physics, biology, anatomy, and physiology—which are in the University buildings are, both as regards structural arrangements and scientific equipment, on the most modern and complete lines. No expense has been spared in the matter of apparatus for teaching or research work and the facilities for practical study in these subjects are second to none. The department of Pathology and Bacteriology in the University is replete with every requirement for the most advanced work in these subjects. There is a large Pathological Museum in the department open daily to students. The post-mortem rooms of the Royal Infirmary and Royal Hospital are under the charge of the Professor of Pathology and afford ample material for demonstrations. In connexion with the University there is a complete dental department, fully recognised by the various examining bodies, at the Sheffield Royal Hospital. A list of the various Scholarships and Fellowships will be found in another column.

Students who have passed their examination in anatomy and physiology can hold the usual dresserships and clerkships, the appointments being for a period of three months except in the case of casualty dresserships, which last two months. All students beginning hospital practice in Sheffield will be required to hold the post of casualty dresser before being eligible for any other of the above appointments. In addition to the laboratories above mentioned the Medical department of the University contains lecture rooms for the various subjects of the curriculum, a complete materia medica museum, and the large library and reading-room of the Medico-Chirurgical Society which is open daily to students for purposes of study.

Fees.—Composition fee of £80, payable in three instalments—viz., £24 at commencement of first year of study, £28 at commencement of second year of study, and £28 at commencement of third year of study. A composition fee of £80 entitles the student to attendance on all the courses of lectures and practical classes except pharmacy, vaccination, and instruction in anæsthetics required for a degree course in the University or for the ordinary qualifications in medicine and surgery of the Examining Boards. The composition fee does not include medical and surgical hospital practice, clinical lectures, practical instruction in mental diseases, diseases of women, and infectious diseases, the fee for the full period of both medical and surgical hospital practice required by the Examining Boards being £36 15*s.* if paid in one sum at commencement of hospital practice; or £37 16*s.* if paid in two sums of £18 18*s.*, one on beginning hospital practice the other twelve months later.

The various athletic and other students' societies are under the management of a students' representative council, elected annually. There are large and comfortable common rooms both for men and women students. A refectory is open daily at the University where students may obtain refreshments, lunch, dinner, &c., at extremely moderate prices. The University journal *Floreamus*, edited by a committee of staff and students, is published each term. The University Hostel, Ashgate-road, is recognised by the Senate as a residence for women students, full particulars of which may be obtained of the Lady Tutor. Other societies of interest to the medical student are the Biological, Chemical, and Clinical and Pathological Societies.

Staff of the Sheffield Royal Infirmary.—Physicians: Dr. W. Dyson, B.A., Dr. W. S. Porter, and Dr. W. Tusting Cocking. Surgeons: Mr. Sinclair White, Mr. Arthur Connell, and Mr. Archibald Cuff. Ophthalmic Surgeon: Mr. Simeon Snell. Medical Officer to the Skin Department: Dr. W. Tusting Cocking. Medical Officer to the Ear and Throat Department: Mr. W. S. Kerr. Pathologist: Professor J. M. Beattie. Medical Officer in Charge of Electrical Department: Dr. A. Rupert Hallam. Anæsthetists: Mr. H. T. Wightman, Mr. J. Wilfred Stokes, and Dr. A. Rupert Hallam. Honorary Secretary to the Medical and Surgical Staff: Mr. Arthur Connell.

Staff of the Sheffield Royal Hospital.—Physicians: Dr. Duncan Burgess and Dr. Arthur Hall. Surgeons: Mr. Mr. H. Lockwood and Mr. G. Wilkinson. Ophthalmic Surgeon: Dr. S. Riseley. Physician for Mental Diseases: Mr. G. E. Mould. Assistant Surgeons: Mr. G. Simpson and Mr. A. Garrick Wilson. Assistant Physicians for Out-patients: Dr A. E. Naish and Dr. A. Young. Anæsthetists: Mr. H. Hallam, Mr. N. Milner, and Dr. G. Murray. Medical Officer to the Electrical and X Ray Department: Dr. W. H. Nutt. Pathologist: Professor J. M. Beattie. Honorary Secretary to the Medical and Surgical Staff: Dr. S. Riseley. Dental Surgeons: Mr. F. G. Mordaunt, Mr. F. Harrison, Mr. D. Dathl Davies, Mr. H. J. Morris, and Mr. C. C. Drabble. Assistant Dental Surgeons: Mr. H. J. Stoner, Mr. P. Southwell Stokes, and Mr. W. J. Law.

There are other institutions at which the students of the University of Sheffield can receive clinical instruction. These are the City Fever Hospitals (Medical Superintendent, Dr. Egerton H. Williams), the South Yorkshire Asylum (Medical Superintendent, Dr. W. S. Kay), and the Jessop Hospital for Women, Gell-street, Sheffield. The hospital contains 54 beds for gynæcological cases and 18 for obstetric cases. A staff of midwives connected with the hospital attend lying-in women at their own homes, and, in case of need, are assisted by the members of the medical staff. A 12 weeks' course of instruction (theoretical and practical) is also provided for resident pupil midwives, the institution being approved by the Central Midwives Board as a training centre. Medical Officers: Mr. Richard Favell, Dr. J. W. Martin, and Mr. Percival E. Barber. Assistant Medical Officer: Mr. M. H. Phillips. Honorary Secretary to the Staff: Mr. Percival E. Barber.

OTHER PROVINCIAL MEDICAL SCHOOLS.

THE institutions which follow provide facilities for different forms of clinical instruction for the medical student or medical graduate. For the most part they are the general hospitals of large towns which are not, at any rate, yet the seat of a university. There are university colleges at Bristol and at Cardiff, and at both cities the Schools of officers, elected annually and eligible for re-election (£50); three house physicians and four house surgeons hold office for six months, receiving board, residence, and salaries at the rate of £50 a year; one house surgeon to the gynæcological, ophthalmic, and aural departments is elected every six months, receiving board, residence, and a salary of £50 a year; two assistant house surgeons are elected every three months, receiving board, residence, and salaries at the rate of £40 a year; a resident medical officer at the Jaffray Hospital, who is elected annually but is eligible for re-election, and who receives £150 a year; and a resident medical assistant at this hospital, who is not necessarily qualified, is provided with board and residence, and holds office for three months. At the Queen's Hospital there are open to the student the following appointments: Three house physicians, three house surgeons, and one obstetric and ophthalmic house surgeon, who hold office for six months and have salaries at the rate of £50 a year. Thirty-five other appointments of varying value are at the City Workhouse and Workhouse Infirmary, at the Birmingham General and Branch Dispensaries, at the Birmingham Lunatic Asylums, at the City Fever Hospitals, at the Children's Hospital, at the Birmingham and Midland Eye Hospital, at the Orthopædic and Spinal Hospital, and at the Ear and Throat Hospital.

The General Hospital contains 342 beds, and of these 327 are in daily use, upwards of 5000 in-patients passing through the wards in the course of a year. There are special wards for children, for gynæcological cases, and for septic and infectious cases, and in addition special beds reserved for eye and ear cases. Some 60,000 out-patients are treated there annually. The post-mortem department is in a separate building. It consists of a mortuary with a small chapel, a post-mortem room proper, and laboratories for bacteriology and morbid histology. In addition there are separate rooms in the main building, adjoining the various medical and surgical wards, for clinical pathology and these are under the direction of special officers. There are four operating theatres, all designed and fitted on the most modern lines. In connexion with the hospital is the Jaffray Suburban Hospital of 52 beds at Gravelly Hill. The arrangements for clinical teaching at this hospital are very thorough. In addition to the clinical teaching given in the wards and out-patient department by the honorary staff medical and tutorial classes are held for senior and junior students, while clinical instruction is given in all the special departments by the gentlemen in charge of them.

Staff of General Hospital.—Consulting Physician: Sir Walter Foster. Consulting Obstetric Officer: Dr. Edward Malins. Physicians: Dr. Robert Saundby, Dr. Robert M. Simon, Dr. T. Stacey Wilson, and Dr. T. Sydney Short. Surgeons: Sir Thomas F. Chavasse, Mr. Gilbert Barling, Mr. William F. Haslam, and Mr. George Heaton. Obstetric Physician: Dr. Thomas Wilson. Ophthalmic Surgeon: Dr. D. C. Lloyd-Owen. Aural Surgeon and Laryngologist: Dr. F. W. Foxcroft. Physician in Charge of Skin Department: Dr. A. Douglas Heath. Assistant Physicians: Dr. James W. Russell and Dr. A Stanley Barnes. Assistant Surgeons: Mr. Albert Lucas, Mr. Leonard P. Gamgee, Mr. F. Victor Milward, and Mr. Frank Barnes. Assistant Obstetric Officer: Dr. John T. Hewetson. Junior Assistant Physicians: Dr. William H. Wynn and Dr. J. E. H. Sawyer. Visiting Pathologist: Dr. James Miller. Anæsthetists: Dr. Sydney Haynes and Dr. W. J. McCardie. Surgical Photographer and Radiographer: Mr. J. Hall Edwards. Dental Surgeon: Mr. A. T. Hilder.

At the Queen's Hospital similar arrangements for clinical teaching are made, and the material here also is excellent, though the institution is, of course, much smaller. Ward and tutorial classes are regularly conducted by the staff, there are daily clinics in the out-patient department, while teaching duties are definitely assigned to the house physicians and house surgeons.

Staff of Queen's Hospital.—Consulting Physicians: Sir James Sawyer, Dr. C. W. Suckling, and Dr. A. H. Carter. Consulting Surgeons: Mr. Furneaux Jordan, Mr. Frank Marsh, Mr. J. St. S. Wilders, and Mr. Bennett May. Consulting Ophthalmic Surgeon: Mr. Priestley Smith. Physicians: Dr. Arthur Foxwell, Dr. O. J. Kauffmann, and Dr. J. Douglas Stanley. Surgeons: Mr. Jordan Lloyd, Mr. J. T. J. Morrison, and Mr. C. A. Leedham-Green. Ophthalmic Surgeon: Mr. Wilfrid Allport. Obstetric Physician: Dr. C. E. Purslow. Physicians for Out-patients: Dr. Joseph George Emanuel and Dr. L. G. J. Mackey. Surgeons for Out-patients: Mr. W. Billington Mr. A. W. Nuthall, and Mr. B. J. Ward. Pathologist: Dr. L. G. J. Mackey.

BIRMINGHAM AND MIDLAND EYE HOSPITAL, Church-street, Birmingham.—Honorary Consulting Physician: Dr. R. Saundby. Honorary Consulting Surgeon: Mr. D. C. Lloyd-Owen. Surgeons: Mr. H. Eales, Mr. E. W. Wood-White, and Mr. J. Jameson Evans. Dental Surgeon: W. T. Madin, L.D.S. Anæsthetist: Dr. S. W. Haynes. This hospital possesses 105 beds, and there is an average daily attendance of out-patients of 217. This institution is recognised by Universities and the Royal College of Surgeons, England, and Royal College of Physicians, London, as an ophthalmic hospital at which clinical instruction in ophthalmology may be received. Students attending for a period of three months will be granted certificates which will qualify for the University and Conjoint Board examinations.

UNIVERSITY OF LEEDS: FACULTY OF MEDICINE.—The Leeds General Infirmary, in connexion with this medical faculty, has accommodation for 524 in-patients, including 96 beds at "semi-convalescent" homes in the country. During the last year 7086 in-patients and 40,418 out-patients were treated. Clinical teaching takes place daily in the wards, and Clinical lectures are given in Medicine and Surgery by the Physicians and Surgeons. There are Medical, Surgical, Ophthalmic, Aural, Electrical, Finsen Light, and X-ray Departments, in each of which special instruction is imparted to students. A Gynæcological and Extern Obstetric Department, in which there were 502 confinements, together with Laryngeal and Skin Clinics, are in operation. The Public Dispensary, the Hospital for Women and Children, the Fever Hospital, the Maternity Home, and the West Riding Lunatic Asylum are other medical institutions which are made use of by the Leeds students. The buildings of the Medical School are placed closed to the Infirmary and contain complete accommodation for the training of medical students upon the most approved modern methods. A very fine dissecting-room, extensive laboratories for Physiology and Pathology, with the most recent improvements in fittings and apparatus, ample lecture-room accommodation, a large Library, and separate Museums for Pathology and Anatomy are some of the most striking features of the buildings. Provision for the convenience of students, in the shape of a common room, a refectory, &c., are made. The classes in Systematic and Practical Chemistry, Physics, Botany, and Zoology, are held in the Science and Arts Department of the University, in College-road. Two Entrance Scholarships are offered: one, of the value of £73 2*s.* 6*d.*, covering admission to all requisite lectures; and the other, of the value of 40 guineas, covering the cost of admission to the medical and surgical practice of the infirmary. Several valuable prizes are given at the end of each session. The following appointments at the Infirmary are annually open to students (for some of them, however, a registered legal qualification is required): Non-resident: clinical pathologist, £200; senior anæsthetist, £50; 5 anæsthetists, £25. Resident: medical officer, £150; surgical officer, £150; casualty officer, £125; ophthalmic, £100. These appointments are made annually and holders are eligible for re-election. Resident medical officer to the Ida Hospital, for six months; honorarium £30. Six house physicians, for six months; 7 house surgeons, for six and 12 months; 24 physicians' clerks, for six months; 24 surgeons' dressers, for six months; 16 ophthalmic and aural surgeons' dressers, for three months; 12 gynæcological ward clerks, for three months; 16 gynæcological out-patient clerks, for three months; 24 maternity clerks, for one month; 24 assistant physicians' clerks, for three months; 8 dermatological clerks, for three months; 8 laryngological clerks, for three months; 24 assistant surgeons' dressers, for three months; 8 assistant ophthalmic surgeons' dressers, for three months; 24 dressers in the casualty-room, for three months; 24 post-mortem room clerks, for three months; 8 laboratory assistants, for three months. There are appointments open to students in other medical institutions in the town and also in the West Riding (Lunatic) Asylum.

Staff of Leeds General Infirmary.—Consulting Physicians: Dr. T. C. Allbutt, Dr. J. E. Eddison, and Dr. C. M. Chadwick. Physicians: Dr. T. Churton, Dr. A. G. Barrs, and Dr. T. W. Griffith. Assistant Physicians: Dr. E. F. Trevelyan, months, 3 guineas; three months, 4 guineas; and six months, 7 guineas.

Further information may be obtained on application to the Dean of the Faculty.

UNIVERSITY OF WALES: MEDICAL FACULTY.—Under the heading of the University of Wales we have already mentioned that that University now possesses the privilege of granting degrees in medicine. Welsh medical students can attend the practice of the Cardiff Infirmary. This infirmary contains 178 beds. Consulting Physicians: Dr. W. T. Edwards, Dr. William Taylor, and Dr. C. T. Vachell. Consulting Surgeon: Dr. T. Wallace. Consulting Dental Surgeon: Mr. John C. Oliver. Physicians: Dr. H. R. Vachell and Dr. A. E. Taylor. Surgeons: Mr. P. Rhys Griffiths, Mr. William Sheen, and Mr. J. Lynn Thomas, C.B. Assistant Physicians: Dr. W. Mitchell Stevens, Dr. Cyril Lewis, and Dr. Alfred Howell. Assistant Surgeons: Mr. H. G. Cook, Mr. Cornelius A. Griffiths, and Mr. William Martin. Ear, Throat, and Nose Surgeon: Dr. D. R. Paterson. Consulting Ophthalmic Surgeon: Mr. J. T. Thompson. Ophthalmic Surgeon: Mr. H. C. Ensor. Assistant Ophthalmic Surgeons: Mr. F. P. S. Cresswell and Mr. R. Russell Thomas. Gynæcologists: Dr. Ewen J. Maclean and Dr. E. Tenison Collins. Pathologist: Dr. W. Mitchell Stevens. Bacteriologist and Assistant Pathologist: Dr. H. A. Schölberg. Sanitary Adviser: Dr. E. Walford. Anæsthetists: Dr. Fredk. W. S. Davies, Dr. W. G. Williams, and Dr. Alex. Brownlee. Dental Surgeons: Mr. T. W. Kittow and Mr. Thomas Quinlan. Resident Medical Officer: Dr. John Wallace.

WOLVERHAMPTON AND STAFFORDSHIRE GENERAL HOSPITAL.—There are 200 beds. It is recognised by the University of London, the Royal Colleges of Physicians and Surgeons, and other examining boards. The in-patients number 2490; the out-patients 19,838. Special departments for Children, Gynæcology, Ear, Throat, and Nose Diseases, Electro-therapeutic and X Ray departments. There is an excellent library. The resident officers are a resident surgical officer, a resident medical officer, and two house surgeons. Pupils are allowed to witness the whole of the practice of the hospital and to be present at operations and have every opportunity of acquiring a practical knowledge of their profession. Fees: £3 3*s.* a quarter, £10 10*s.* the first year, and £5 5*s.* subsequent years. A course of Practical Pharmacy is given by the dispenser. Fee £3 3*s.* for three months. Applications should be made to the Secretary of the Medical Committee.

Staff.—Consulting Physician: Dr. W. Millington. Consulting Surgeon. Physicians: Dr. H. Malet, Dr. C. A. MacMunn, and Dr. J. A. Codd. Surgeons: Mr. J. O'B. Kough, Mr. W. H. T. Winter, Mr. E. Deanesly, and Mr. A. H. Hunt. Assistant Physicians: Dr. A. H. Carter and Dr. E. H. Coleman. Assistant Surgeons: Mr. W. F. Cholmeley and Mr. H. Dent.

NORFOLK AND NORWICH HOSPITAL (220 beds).—Non-resident pupils admitted. Fees: For three months, £3 3*s.*; for six months, £5 5*s.*; as permanent pupil, £8 8*s.* Consulting Physician: Sir P. Eade. Consulting Surgeons: Dr. Beverley and Mr. H. S. Robinson. Physicians: Dr. Barton, Dr. Burton-Fanning, and Dr. Long. Surgeons: Mr. S. H. Burton, Mr. D. D. Day, and Mr. H. A. Ballance. Assistant Physician: Dr. A. J. Cleveland. Assistant Surgeons: Mr. T. H. Morse and Mr. E. W. Everett. Dental Surgeon: Mr. H. F. White. Electro-Therapeutist: Dr. A. J. Cleveland. Secretary: Mr. F. G. Hazell.

ROYAL DEVON AND EXETER HOSPITAL, Exeter.—Medical and Surgical Staff: Consulting Physician: Dr. Drake. Physicians: Dr. H. Davy and Dr. William Gordon. Surgeons: Mr. J. D. Harris, Mr. E. J. Domville, Mr. Charles E. Bell, and Mr. A. C. Roper. Medical Registrar and Pathologist: Mr. Reginald V. Solly. Surgeon Dentist: Mr. J. M. Ackland. Anæsthetists: Mr. Henry Andrew and Mr. Brennan Dyball. The hospital contains 200 beds (including special children's wards) and has a good library, museum, dissecting room, and post-mortem room. Attendance on the practice of this hospital qualifies for all the examining boards. Arrangements can be made by which students can attend Midwifery on application to the House Surgeon. There is also a Private Nursing Staff attached to the hospital. For particulars as to fees, &c., apply to the Matron. A new wing was added in 1897. Arrangements may be made by which gentlemen in practice desiring to increase their qualifications may have the use of the museum and library and other facilities and by which students may attend midwifery. A new Operating Theatre was opened in 1906 (the gift of Mrs. Nosworthy of Newlands, Dawlish, Devon). An Electrical Treatment Department (the gift of Mrs. M. A. Sanders) was opened in 1907 by Lady Duckworth-King.

NORTH STAFFORDSHIRE INFIRMARY AND EYE HOSPITAL, Hartshill, Stoke-on-Trent.—The New Infirmary, opened in 1869, is built on the pavilion plan, has accommodation for over 200 patients, including Children's wards, special Ovarian wards, and a special department for the treatment of Diseases of the Eye. In-patients last year, 2281; out-patients, 13,937. The attendance of pupils at this infirmary is duly recognised by all the examining boards; and there are unusual facilities for acquiring a practical knowledge of the profession. Physicians: Dr. H. Nicholls and Dr. S. King Alcock. Surgeons: Dr. G. Stokes Hatton and Dr. Wheelton Hind. Assistant Physicians: Mr. John Russell and Dr. W. E. L. Horner. Assistant Surgeons: Mr. Reginald Alcock and Dr. W. C. Allardice. Ophthalmic Surgeon: Mr. Herbert H. Folker. Assistant Ophthalmic Surgeon: Mr. R. H. Dickson. Medical Officer in Charge of the Electrical Department: Dr. G. H. List. Dental Surgeon: Mr. A. Baines. Secretary and House Governor: Mr. Albert E. Boyce, F.C.I.S., F.L.A.A.

SUSSEX COUNTY HOSPITAL (196 beds).—During the year 1907, 2260 in-patients have been treated. The total number of out-patient attendances on the books during 1907 was 36,132. This hospital affords ample facilities for students, possessing a large out-patient department, a library, and a well-appointed clinical research and bacteriological department. The hospital does not take resident pupils, but out-pupils may attend the practice of the hospital for any period not exceeding two years on payment in advance of such a fee, not exceeding 20 guineas, as the Committee of Management shall direct. Consulting Physicians: Dr. Rutter, Dr. Hollis, and Dr. Branfoot. Physicians: Dr. J. F. G. Dill, Dr. Hobhouse, and Dr. Maynard. Assistant Physicians: Dr. W. Broadbent, Dr. Hall, and Dr. Bailey. Consulting Surgeons: Mr. H. P. Blaker and Mr. W. Furner. Surgeons: Mr. T. J. Verrall, Mr. R. F. Jowers, and Mr. F. J. Paley. Assistant Surgeons: Mr. A. Buck, Mr. T. H. Ionides, and Mr. W. A. Bowring.

NORTHAMPTON GENERAL HOSPITAL (established 1743; rebuilt 1793).—Two new wings were opened in 1904 and the old buildings entirely renovated and re-arranged. The number of beds is 166. Non-resident pupils are received and have every opportunity of acquiring a practical knowledge of their profession. The fee is £10 10*s.* Pupils can be received at any time. Physicians: Dr. Frank Buszard and Dr. Peverell S. Hichens. Surgeons: Mr. George H. Percival and Mr. R. A. Milligan. Ophthalmic Surgeon: Mr. E. Harries Jones. Assistant Physician: Dr. W. M. Robson. Assistant Surgeon: Mr. N. Blake Odgers. Dental Surgeon: Mr. E. Rogers Bull.

LEICESTER INFIRMARY.—Instruction in the infirmary for first-year students is duly recognised by the various examining bodies. At the General Infirmary there are 198 beds and at the Children's Hospital in connexion 42; total 240. There are upwards of 3000 in-patients annually and 30,000 out-patients and casualties. A new wing containing 100 beds has recently been opened by H.R.H. the Duchess of Argyll. A new Nurses' Home containing separate accommodation for 110 nurses and servants is in course of erection. There are eight resident medical officers. House Governor and Secretary, Harry Johnson.

THE ROYAL HOSPITAL, PORTSMOUTH (founded 1847).—The number of beds is 132. During the year 1907 there were 1537 in-patients and 13,421 out-patients. Honorary Physicians: Dr. John Phillips and Dr. C. C. Claremont. Surgeons: Mr. C. P. Childe, F.R.C.S., Mr. T. A. M. Forde, M.R.C.S., and Mr. A. B. Wright, M.R.C S. Honorary Anæsthetist: Dr. W. J. Essery. Honorary Assistant Physicians: Dr. W. P. McEldowney, Dr. J. T. Leon, and Dr. E. J. Davis Taylor. Honorary Assistant Surgeons: Mr. L. Cole Baker, Mr. C. A. Scott Ridout, and Mr. H. Burrows. The hospital is

Medicine are able to supply a complete curriculum. The students, however, must go elsewhere for degrees or diplomas.

UNIVERSITY COLLEGE, BRISTOL: FACULTY OF MEDICINE.—Extensive additions have been made to the Anatomical, Bacteriological, and Pathological Departments. Students of the College are admitted to the Clinical Practice of the Bristol Royal Infirmary and the Bristol General Hospital conjointly, and consequently both these institutions are open to all students, men and women alike. The Infirmary and the Hospital comprise between them a total of 470 beds; and both have very extensive out-patient departments, special departments for the Diseases of Women and Children, and of the Eye, Ear, and Throat, besides large outdoor Maternity Departments and Dental Departments. Students may also attend the practice of the Bristol Royal Hospital for Sick Children and Women, containing 104 beds, and that of the Bristol Eye Hospital, with 40 beds. The total number of beds available for clinical instruction is 614. Very exceptional facilities are thus offered to students for obtaining a wide and thorough acquaintance with all branches of Medical and Surgical work. Each student has the opportunity of personally studying a large number of cases and of acquiring practical skill in diagnosis and treatment. The annual prize distribution will take place on Oct. 1st

Courses of Lectures.—Medicine: Professor F. H. Edgeworth and Professor J. Michell Clarke. Surgery: Professor C. A. Morton and Professor James Swain. *Anatomy: Professor Edward Fawcett. Practical Anatomy:* Demonstrators, Mr. E. W. Hey Groves, Mr. W. S. Vernon Stock, Mr. C. B. Goulden, and Mr. J H. E. Elliot. Physiology and Histology: Professor A. F. Stanley Kent. Demonstrator: (vacant) Chemistry: Professor Francis Francis. Public Health: Dr. D. S. Davies. Midwifery: Professor W. C. Swayne. Medical Jurisprudence: Dr. R. Eager and Dr. G. Parker. Pathology and *Morbid Anatomy: Professor* I. Walker Hall. Demonstrator: Dr. Carey F. Coombs. Operative Surgery: Mr. J. Paul Bush. Practical Medicine: Professor Edgeworth and Professor Michell Clarke. *Practical Surgery:* Dr. R. G. Poole Lansdown. Practical Midwifery: Mr. D. C. Rayner. Materia Medica and Practical Pharmacy: Mr. C. C. M. Davis. Pharmacology and Therapeutics: Dr. Newman Neild. Biology: Professor S. H. Reynolds. Practical Chemistry: Professor Francis Francis. Practical Bacteriology: Professor I. Walker Hall. Comparative Anatomy: Professor C. Lloyd Morgan. Dental Anatomy and Physiology and Dental Histology: Mr. E. A. G. Dowling. Dental Bacteriology: *Professor* I. Walker Hall. Dental Surgery and Practical Dental Surgery: Mr. W. R. Ackland. Dental Mechanics and Dental Metallurgy and Practical Dental Metallurgy: Dr. C. A. *Hayman. Composition fee for lectures and hospital* practice, 133 guineas. Composition fee for Dental lectures and surgical practice, 75 guineas; for two years' instruction in *Mechanical Dentistry, 75 guineas; if whole curriculum* be taken the composition fee is 140 guineas. Special six months' course for Diploma in Public Health. 1. Lectures on Public Health: *Dr. D. S. Davies.* 2. *Bacteriology: Professor* A. F. Stanley Kent. 3. Laboratory Course of Hygienic Chemistry: Mr. F. W. Stoddart. 4. Demonstrations on the Various Acts, Orders, By-laws, &c.: Mr. J. C. Heaven. 5. Practical Outdoor Sanitary Work: Dr. D. S. Davies. Fee for the entire course 25 guineas. The prizes and scholarships in connexion with the Bristol Medical School will be found on p. 667. Full information can be obtained on application to the Dean, Professor Edward Fawcett, University College, Bristol.

Professors—Chemistry: F. Francis, D.Sc. Experimental Physics: A. P. Chattock. Zoology: S. H. Reynolds, M.A. Psychology: C. Lloyd Morgan, LL.D., F.R.S. Medicine: F. H. Edgeworth, M.D., and J. Michell Clarke, M.D. Surgery: C. A. Morton, F.R.C.S., and J. Swain, F.R.C.S. Anatomy: E. Fawcett, M.D. Physiology and Histology: A. F Stanley Kent, M.A. Midwifery: W. C. Swayne, M.D. Pathology: I. Walker Hall.

THE ROYAL INFIRMARY, Bristol, has 270 beds, the number of in-patients is 4000, and the number of out-patients 45,000 annually. There are separate wards for diseases of children, eye cases, diseases of women, and diseases of throat and nose. The Pathological and Bacteriological Departments have been newly equipped and are under the direction of the pathologist. In clinical pathology a special room is set apart for the exclusive use of students and research workers, and post-graduate courses may be taken over by arrangement with the pathologist. In the Pharmaceutical Department special classes are held by the pharmacist. Clinical appointments: All students must undergo before holding Clinical appointments preliminary instruction for three months in pathological, medical, surgical, and dental methods of diagnosis, &c. Pathological Clerkship for three months. Surgical Dresser for six months: the dressers reside in the Infirmary free of expense in rotation a week at a time, taking a part in the whole daily routine of surgical work. Medical Clerk for six months; Obstetric Clerk for three months; Ophthalmic Clerk for three months. In other special departments *attendance is made during the fifth year of study.* A convenient students' room is provided. Resident appointments: The posts of House Surgeon, House Physician, Resident Obstetric Officer, Junior House Surgeon, and Casualty Officer are all salaried. The two senior posts are usually held for one, two, or more years, the obstetric post is held for 12 months, and the two junior posts are tenable for six months each. Honorary and Consulting Physicians: Dr. W. H. Spencer, Dr. R. Shingleton Smith, Dr. H. Waldo, and Dr. J. E Shaw. Honorary and Consulting Surgeons: Mr. E C. Board, Mr. W. H. Harsant, and Mr. A. W. Prichard. Honorary and Consulting Ophthalmic Surgeon: Mr. F. Richardson Cross. Honorary Physicians: Dr. A. B. Prowse and Dr. F. H. Edgeworth. Honorary Surgeons: Mr. J. Paul Bush, Mr. G. Munro Smith, Dr. J Swain, and Mr. T. Carwardine. Honorary Ophthalmic Surgeon: Dr. Ogilvy. Honorary Obstetric Physician: Dr. Walter Swayne. Honorary Dental Surgeon: Mr. W. R. Ackland. Honorary Physician to the Throat and Nose Department: Dr. P. Watson Williams Honorary Assistant Dental Surgeon: Dr. Charles A. Hayman. *Honorary Assistant Physicians:* Dr. J. R Charles and Dr. J. A. Nixon. Honorary Assistant Surgeons: Mr. H. F. Mole and Mr. E. H. E. Stack. Pathologist: Dr. I. Walker Hall. *Honorary Demonstrator of Morbid Anatomy:* Dr. J. J. S. Lucas. Honorary Anæsthetist: Mr. A. L. Fleming. Honorary Assistant Anæsthetist: Mr. S V Stock. Honorary Skiagraphist: Mr. James *Taylor. House* Surgeon and Senior Resident Medical Officer: Mr. A. L. Sheppard.

BRISTOL GENERAL HOSPITAL.—Number of beds 200; number of in-patients over 2000; number of out-patients about 40,000 annually. The arrangements are practically similar to those at the Royal Infirmary. Honorary and Consulting Physician: Dr. A. J. Harrison. Honorary and Consulting Surgeons: Mr. Robert W. Coe, Dr. George F. Atchley, Mr. Nelson C. Dobson, Mr. F. Poole Lansdown, and Mr. Chas. F. Pickering. Physicians: Dr. J. Michell Clarke, Dr. George Parker, and Dr. J. O. Symes. Surgeons: Mr. C. A. Morton, Dr. R. G. Poole Lansdown, Dr. J. Lacy Firth, and Dr. H. Greville Kyle. Physician Accoucheur: Dr. W. H. C. Newnham. Physician to Department for Diseases of the Skin: Dr. W. Kenneth Wills. Surgeon to the Throat and Nose: Dr. J. Lacy Firth. Ophthalmic Surgeon: Mr. Cyril H. Walker. Assistant Physicians: Dr. Newman Neild and Dr. Carey F. Coombs. Assistant Surgeon: Mr. E. W. H. Groves. Assistant Physician Accoucheur: Mr. D. C. Rayner. Anæsthetists: Dr. J. Freeman and Dr. Hedley Hill. Dental Surgeon: Mr. E A. G. Dowling. Pathologists: Mr. E. V. Dunkley. Curator of Museum: Dr. Coombs. Skiagraphist: Mr. J. Ellington Jones.

Resident Appointments.—There are five resident appointments in the Hospital, and the Dressers reside in rotation, free of *expense. The Maternity students also have* rooms provided in the institutions.

Fees.—Medical Practice: three months, 4 guineas; six months, 7 guineas; one year, 12 guineas; perpetual, 20 guineas. Surgical Practice: three months, 4 guineas; six months, 7 guineas; one year, 12 guineas; perpetual, 20 guineas. Medical and Surgical Practice together in one payment: six months, 12 guineas; one year, 20 guineas; perpetual, 35 guineas. Dental Surgical Practice: one year, 7 guineas; perpetual, 12 guineas. The above fees include Clinical Lectures. Clinical Clerkship: 5 guineas for six months. Dressership: 5 guineas for six months. Museum fee: 3 guineas (composition on entrance), or 1 guinea annually. Dispensing Fee: 2 guineas. *Students from other schools or* qualified medical men wishing to attend Clinical Practice for short periods and not requiring certificates for such attendance *may do so for the* following fees:—Medical and Surgical Practice conjointly: one month, 2 guineas; two

Dr. W. G. A. Robertson (£1 1s.); Practical Gynæcology, Dr. Brewis (£2 2s.); Diseases of the Eye, Dr. W. G. Sym; Bacteriology, Dr. J. Taylor Grant: *Tropical Diseases, Major D. G.* Marshall; Fevers, City Hospital. Summer Session: Practical Anatomy, Dr. Ryland Whitaker (£2 2s.); Practical Chemistry, Dr. T. W. Drinkwater (£3 3s.); Materia Medica, &c., Dr. Craig and Dr. F. D. Boyd (£3 3s.); Operative Surgery and Surgical Anatomy, Mr. H. Wade (£3 3s.); Materia Medica and Therapeutics, Dr. Wm. Craig (£3 3s.); *Practical Materia Medica, Dr. Wm. Craig and Dr. Boyd:* Medical Jurisprudence and Public Health, Dr. Aitchison Robertson (£3 5s.); Public Health, Dr. W. Robertson; Clinical Medicine, Dr. W. Russell; Clinical Surgery, Mr. Wallace, Royal Infirmary (£3 5s.); Practical Physiology and Histology, Dr. Goodall (£3 3s.); Practical Pathology, Dr. S. McDonald (£3 3s.); Biology, Miss Newbigin (£3 3s.); Physics, Dr. Dawson Turner (£3 3s.): Ophthalmology, Dr. A. H. H. Sinclair (£2 2s.); Insanity, Sir J. Batty Tuke and Dr. G.* M. Robertson (£2 2s.); Practical Gynæcology, Dr. J. W. Ballantyne (£2 2s.); Practical Medicine, Dr. Philip and Dr. G. Lovell Gulland; Practical Medicine, Clinical Methods, Dr. W. Russell; Vaccination, Dr. W. G. A. Robertson; Tropical Diseases, Major Marshall; Medical Electricity, Dr. Dawson Turner.

The minimum cost of the education in this School of Medicine for the Triple Qualification of Physician and Surgeon from the Royal Colleges of Physicians and Surgeons of Edinburgh and the Faculty of Physicians and Surgeons of Glasgow, including the fees for the Joint Examinations, is about £115, payment of which is distributed over the period of study. There is no composition fee.

Further particulars regarding the school, also its calendar, may be had on application to Mr. R. N. *Ramsay*, the Secretary and Registrar, 27, Forrest-road, Edinburgh.

* Lectures, £3 5s.; Practical, £3 3s.; Analytical, £2 a month, or £5 for three months. † Also in Summer Session. ‡ Also in Winter Session. § Practical, £3 3s.; Analytical, £2 a month, or £5 for three months.

N.B.—Where two or more lecturers appear as teaching the same subjects their lectures are not conjoined, but each gives an independent course.

THE EDINBURGH SCHOOL OF MEDICINE FOR WOMEN.—The Edinburgh School of Medicine for Women provides all the classes required for a complete curriculum. The classes qualify for the University Degree in *Medicine, for the* Diploma of the Royal Colleges, and for the *triple qualification*. The lecturers of the school are *specially recognised* by the Court of Edinburgh University for the *education of* women who propose taking the degree in medicine of the University of Edinburgh. Most of the classes are held in Surgeons' Hall. The office of the school and a sitting-room and other conveniences are provided in the same building for the use *of the* women students. The clinical instruction of the students is *conducted in the* wards of the Royal Infirmary, specially set apart for the purpose; in the Royal Hospital for Sick Children; in the *City Hospital for Infectious* Diseases; at one of the lunatic *asylums near the city*: and at the various public *dispensaries*. The fees and the regulations as to the course of study are the *same* as for the male students. Further *particulars* can be obtained from the Dean of the School of Medicine for *Women*, Surgeons' Hall, Edinburgh.

ANDERSON'S COLLEGE MEDICAL SCHOOL, Dumbarton-road, Glasgow, W.—This medical school was founded in the year 1800. It has given 13 professors to the University of Glasgow. The following courses are given, which qualify for all the licensing boards and for the Universities of London, Durham, Ireland, Edinburgh, and Glasgow (the latter two under certain conditions):—In winter: *Anatomy*, Professor A. M. Buchanan; Physics, Professor Peter Bennett; Chemistry, Professor J. Robertson Watson; Botany, Professor B. G. Cormack; Zoology, Professor Geo. Bell Todd; Physiology: Professor R. Speirs Fullarton; Materia Medica, Professor John P. Duncan; Midwifery, Professor John Edgar; Surgery, Professor J. H. Nicoll; Practice of Medicine, Professor John Cowan; Ophthalmic Medicine and Surgery, Dr. T. Spence Meighan; Aural Surgery, Dr. J. Galbraith Connal; Diseases of Throat and Nose, Dr. John Macintyre; Public Health (Laboratory Course), Dr. Carstairs C. Douglas. In summer: Anatomy, Practical Anatomy, and Osteology; Practical Chemistry; Botany and Practical Botany; Zoology and Practical Zoology; Practical Physiology; Practical Materia Medica and Pharmacy; Diseases of Women and Children (Professor *John Edgar); Operative Surgery*; Ophthalmic Medicine and Surgery; Aural Surgery; Mental Diseases (Dr. John Carswell); and Public Health (Lecture Course and Laboratory *Course*). The Chemical Laboratory is open daily from 10 to 6. The Dissecting-room is open in winter from 9 A.M. *to* 6 P.M., and *in* summer from 6 A.M. to 6 P.M. The students are assisted in their dissections by the Professor *and Demonstrators, by* whom frequent examinations and demonstrations on the *parts dissected are* conducted. The supply *of subjects for dissection is* ample, and students are consequently provided *with* parts *as* soon as they may be ready for them. The *Dissecting-room is* provided with a *complete series of dissected specimens*, mounted in plaster of Paris, illustrating the anatomy of the human body. *Candidates for the Licence in Dental* Surgery can obtain the full medical curriculum in Anatomy, Chemistry, *Physiology*, Surgery, *Practice of Medicine, and* Materia Medica. The courses special to Dentistry are conducted at the Glasgow Dental Hospital and School.

The new buildings are situated in Dumbarton-road, immediately to the west of the entrance to the Western Infirmary, within two minutes' walk of it, and four minutes' walk of the University. Extensive accommodation is provided for Practical Anatomy, Practical Chemistry, Practical Botany, Practical Zoology, Practical Physiology, Practical Pharmacy, and Operative Surgery. Ample provision has also been made for the comfort of students.

Class Fees.—For each course of Lectures (Anatomy, Ophthalmic Medicine and Surgery, Aural Surgery, Diseases of Throat and Nose, Mental Diseases, and Public Health excepted), first session, £2 2s.; second session (in Anderson's College), £1 1s.; afterwards free. For Practical Classes (except Anatomy, Chemistry, and Public Health)—namely, Botany, Zoology, Physiology, Pharmacy, and Operative Surgery—first session, £2 2s.; second session, £2 2s. Anatomy Class Fees: Winter, first session, Lectures and Practical Anatomy, £5 5s.; Practical Anatomy alone, £2 2s. *Second session*, Lectures and Practical Anatomy, £5 5s.; Practical Anatomy alone, £2 2s. Third session, Practical Anatomy, £1 1s. Summer, Lectures and Practical Anatomy, £2 12s. 6d.; Lectures alone, £1 11s. 6d.; Practical Anatomy alone, £1 11s. 6d.; *Osteology* and Practical Anatomy, £2 12s. 6d.; Osteology *alone, £1 11s. 6d.*; *Practical* Anatomy alone, £1 11s. 6d. Chemistry: Lectures, £2 2s.; Practical Chemistry, £3 3s. Botany and Zoology: *Reduced* fees for Lectures with Laboratory work in Botany or in Zoology, during same summer session, £3 3s.; for Lecture Class or Practical Class separately, in Botany or in Zoology, £2 2s. Ophthalmic Medicine and Surgery (including Hospital Practice), Aural Surgery, Diseases of Throat and Nose, and Mental Diseases, fee for each course, £1 1s. Public Health Laboratory, fee for six months' course, £11 11s.; including Course of Lectures, £12 12s. Matriculation Fees: For the year, 10s.; for one class in winter session alone, 5s.; for summer session alone, 5s.

Western Infirmary.—Fees: For Hospital Attendance, £10 10s.; afterwards free. For Clinical Instruction, winter, £3 3s.; summer, £2 2s. Pathology: systematic, £4 4s.; practical, £3 3s. Vaccination fee, £1 1s.

Royal Infirmary.—Fees: Hospital Practice and Clinical Instruction, first year, £10 10s.; second year, £10 10s.; afterwards free. Six months, £6 6s.; three months, £4 4s. Pathology, both courses, £4 4s. Vaccination Fee, £1 1s.

Attendance at the dispensaries of the Western and Royal Infirmaries is included in the hospital fee.

Maternity and Women's Hospital.—Fee for six months, £3 3s.

Royal Hospital for Sick Children.—Fee for one year, £1 1s.

Eye Infirmary.—Fee: Hospital Practice and Clinical instruction, including Lectures at the College, six months, £1 1s.

Lock Hospital.—£1 1s.

Fever Hospital, Belvidere or Ruchill.—Fee, £1 1s.

Hospital for Skin Diseases.—Fee, £1 1s.

The Carnegie Trust extends its benefactions to students at Anderson's College Medical School. Full particulars may be obtained from Mr. W. S. McCormick, the Carnegie Trust Offices, Merchants' Hall, Edinburgh.

Certificates of attendance on the lectures at Anderson's College Medical School are received by the Universities of London, Durham, Ireland, Edinburgh, and Glasgow (the latter two under certain conditions); by the Royal Colleges a preparatory School of Medicine and Surgery; the attendance of pupils at this hospital is recognised by the Examining Boards. Particulars of the Secretary at the hospital.

KENT AND CANTERBURY GENERAL HOSPITAL.—The hospital contains 104 beds. Pupils of the staff are admitted to the practice of the hospital and have the use of the library of the East Kent and Canterbury Medical Society for £7 7*s.* Operation day, Thursday, 11 A.M. Physicians: Dr. Harold Wacher and Dr. M. T. Williams. Consulting Surgeons: Mr. James Reid and Mr. Frank Wacher. Surgeons: Dr. T. Whitehead Reid, Mr. J. Greasley, Mr. Sidney Wacher, and Mr. Z. Prentice. Dentist: Mr. R. S. N. Faro. Secretary: Mr. Arthur J. Lancaster. Over 900 in-patients, 2000 out-patients and casualties, and 800 dental cases are attended in a year.

WEST OF ENGLAND EYE INFIRMARY, Exeter.—Physician: Dr. William Gordon. Surgical Staff: Mr. A. C. Roper and Mr. Ransom Pickard. Assistant Surgeon: Mr. Leonard R. Tosswill. Secretary: Mr. Sidney E. Whitton. The infirmary contains 64 beds. Students of the Exeter Hospital can attend the practice of the Eye Infirmary. Patients for the year ending Michaelmas, 1907, 2871.

SCOTLAND.

MEDICAL SCHOOLS WITH FULL CURRICULUM.[1]

SCHOOL OF MEDICINE OF THE ROYAL COLLEGES, Edinburgh.—The number of students varies much in the classes and subjects. It is within the limit to say that about 1200 students avail themselves each session of the opportunity of attending the school. The lectures qualify for the University of Edinburgh and other Universities, the Royal Colleges of Physicians and Surgeons of London, Edinburgh, and Dublin, the Faculty of Physicians and Surgeons of Glasgow, and other Medical and Surgical and Public Boards. A post-graduate vacation course commences on August 31st.

The anatomy rooms and laboratories will open on Thursday, Oct. 1st, and the lectures will commence on that date.

In accordance with the statutes of the University of Edinburgh one-half of the qualifying classes required for graduation may be attended in this school, in addition to the class of Practical Materia Medica and the classes of Clinical Medicine and Clinical Surgery. The regulations require that the fee for any class taken for graduation in Edinburgh shall be the same as that for the corresponding class in the University. The whole education required for graduation at the University of London may be taken in this school.

The appointment of Resident Physician to the wards in the Royal Infirmary under the care of the Ordinary Physicians is open to those members of their clinical class who have held the office of clerk in their wards for at least six months. Six Residentships are appointed for a period of six months each. Resident Surgeons are also appointed by the Ordinary Surgeons to the Hospital. In all respects the students are taught under regulations similar to those at the University of Edinburgh and the other Universities of Scotland, and they receive similar certificates at the close of each session. Moreover, the University and College authorities in Edinburgh and the governing board of the school call upon each recognised lecturer to supply them at the close of each session with a statement giving the number of students attending the class, the number of lectures or prelections delivered during the session, the class examinations held, and the general mode of conducting the class. The courses on special non-qualifying subjects have for the last quarter of a century formed a marked feature of the school. Indeed, such medical subjects could be studied in Edinburgh only in this school until lately, when the University of Edinburgh appointed from the school lecturers on Diseases of the Eye, Insanity, and Diseases of Children to take charge of classes intra-murally. A list of the classes and lecturers will be found below. Special courses of instruction for dental students and for women are also included in the curriculum of this school. The classes of the school are conducted in several separate buildings, such as at Surgeons' Hall, Minto House, Nicolson-square, and the New School, Bristo-street.

Lecturers and fees.—Winter Session: Anatomy, Practical Anatomy, and Demonstrations, Dr. Ryland Whitaker (£3 5*s.* and £4 4*s.*); Chemistry (Practical, &c.), Mr. Gemmell, and Dr. T. W. Drinkwater*; Physiology (Institutes of Medicine), Dr. Alex. Goodall‖; (£3 5*s.*); General Pathology, &c., Dr. Shennan and Dr. Stuart McDonald (£3 5*s.*); Biology, Mr. Malcolm Laurie (£3 5*s.*); Zoology, Mr. Malcolm Laurie; Physics, Dr. Dawson Turner (£3 3*s.*); Bacteriology, Dr. Taylor Grant, Dr. Theodore Shennan, and Dr. Stuart McDonald; Practice of Physic, Dr. Gibson, Dr. Bruce, Dr. Philip, Dr. R. A. Fleming, Dr. Lovell Gulland, Dr. W. Russell, and Dr. Harry Rainy (£3 5*s.*); Surgery, Mr. Hodsdon, Mr. Wallace, Mr. Miles, Mr. Scot Skirving, Mr. Dowden, and Mr. Chiene (£3 5*s.*); Materia Medica, &c., Dr. Craig and Dr. F. D. Boyd† (£3 5*s.*); Midwifery, &c., Dr. Haig Ferguson, Dr. Macrae Taylor, Dr. Hart, Dr. Haultain, Dr. Ballantyne, Dr. Fordyce, and Dr. Elsie M. Inglis (£3 5*s.*); Medical Jurisprudence, &c., Dr. Aitchison Robertson (£3 5*s.*); Public Health, Dr. Aitchison Robertson and Dr. W. Robertson; Hospital Practice (Edinburgh Royal Infirmary): Physicians, Dr. Bramwell, Dr. Gibson, Dr. Bruce, Dr. Philip, Mr. Wallace, and Dr. Brewis for Gynæcology; Surgeons, Mr. Cotterill, Mr. Cathcart, and Dr. Hodsdon (perpetual ticket, £12); Clinical Medicine, Dr. Byrom Bramwell, Dr. Gibson, Dr. Bruce, and Dr. Philip; Dr. Brewis for Gynæcology (£3 5*s.*); Clinical Surgery, Mr. Cotterill, Mr. Cathcart, Mr. Hodsdon, and Mr. Wallace (£3 5*s.*); Diseases of the Chest, Dr. Philip† and Dr. Lovell Gulland (£2 2*s.*); Vaccination, Dr. Buist† and Dr. W. G. A. Robertson (£1 1*s.*); Diseases of Ear, Nose, and Throat, Dr. J. Malcolm Farquharson and Dr. J. S. Fraser (£2 2*s.*); Diseases of the Eye, Dr. Sym,† (£2 2*s.*); Ophthalmoscopy, Dr. A. H. H. Sinclair (£2 2*s.*); Gynæcology, Dr. Haig Ferguson and Dr. Elsie M. Inglis (Systematic), Dr. Brewis and Dr. J. Haig Ferguson (Clinical), and Dr. J. W. Ballantyne (Advanced) (£2 2*s.*); Neurology, Dr. J. J. Graham Brown (£2 2*s.*); Clinical Methods, Dr. W. Russell (£2 5*s.*); Medical Electricity, Dr. Dawson Turner (£2 12*s.* 6*d.*); Tropical Diseases, Major D. G. Marshall, I.M.S. (£2 2*s.*). Summer Session: Practical Anatomy and Demonstrations, Dr. Ryland Whitaker (£2 2*s.*); Practical Physiology, Dr. Goodall (£3 3*s.*); Biology, Mr. M. Laurie‡ and Miss Newbigin (£3 3*s.*); Practical Chemistry and Analytical Chemistry, Mr. Gemmell and Mr. Drinkwater §; Practical Bacteriology, Dr. Shennan, Dr. Taylor Grant, and Dr. Stuart McDonald; Materia Medica, Dr. Craig and Dr. F. D. Boyd; Diseases of the Eye, Dr. Sym (£2 2*s.*); Medical Psychology and Insanity, Sir J. Batty Tuke and Dr. Robertson (£2 2*s.*); Medical Jurisprudence, Dr. Aitchison Robertson; Public Health, Dr. Wm. Robertson (£2 2*s.*); Gynæcology, Dr. Brewis (£2 2*s.*); Midwifery Lectures, Dr. Ferguson, Dr. Ballantyne, Dr. Fordyce, Dr. Elsie M. Inglis, Dr. J. Lamond Lackie, and Dr. W. Macrae Taylor (£3 5*s.*); Operative Surgery, Mr. Hodsdon, Mr. Alexis Thomson, Mr. Alex. Miles, Mr. Dowden, Mr. Scot Skirving, and Mr. Chiene (£3 3*s.*); Practical Pathology, Dr. Shennan and Dr. Stuart McDonald (£3 3*s.*); Physics, Dr. Turner‡ (£3 3*s.*); *Practical Medicine and Physical Diagnosis*, Dr. Fleming, Dr. Lovell Gulland, and Dr. Harry Rainy (£3 3*s.*); *Clinical Medicine*, Dr. Bramwell, and Dr. Gibson (£2 2*s.*); *Vaccination*, Dr. Buist and Dr. W. G. A. Robertson (£1 1*s.*); Neurology, Dr. Bruce and Dr. Graham Brown; Diseases of Ear, Nose, and Throat, Dr. J. Malcolm Farquharson and Dr. J. S. Fraser (£2 2*s.*); Tropical Diseases, Major D. G. Marshall, I.M.S. (£2 2*s.*); Medical Electricity, Dr. Dawson Turner.

Special Classes for Women, Winter Session:[2] Practical Anatomy and Demonstrations, Dr. Ryland Whitaker (£4 4*s.*); Chemistry (Lectures and Practical), Dr. T. W. Drinkwater (£3 5*s.* and £3 3*s.*); Practice of Physic, Dr. W. Russell (£3 5*s.*); Surgery, Mr. Wade (£3 5*s.*); Midwifery and Diseases of Women, Dr. J. W. Ballantyne; General Pathology, Dr. S. McDonald (£3 5*s.*); Physiology (Institutes of Medicine), Dr. Goodall (£3 5*s.*); Materia Medica, &c., Dr. Craig (£3 5*s.*); Clinical Medicine, Dr. W. Russell, Royal Infirmary (£3 5*s.*); Clinical Surgery, Mr. Wallace, Royal Infirmary (£3 5*s.*); Physics, Dr. Dawson Turner (£3 3*s.*); Vaccination, Dr. Buist and

---

[1] For Scholarships see p. 668 et seq.

[2] The scheme of Classes for Women is being rearranged as we go to press and exact details are not available.

Surgery: Mr. J. H. Pringle. On the Eye: Dr. A. M. Ramsay.

UNIVERSITY COLLEGE, Dundee.—This College is one of the constituent colleges of the University of St. Andrews. In the new medical buildings there are spacious and well-equipped laboratories and work-rooms for Anatomy, Physiology, Materia Medica, Pathology, Ophthalmology, Public Health, Medicine, Surgery, and Gynæcology. The complete medical curriculum can be taken in Dundee. For classes, fees, &c., see under University of St. Andrews.

ROYAL INFIRMARY, Dundee.—The Infirmary contains 400 beds, including special wards for the Diseases of Women, Children, Eye, Ear and Throat, and Obstetric cases. There is in addition an Extern Obstetric Department. There were during last year 17,970 out-patients and 7842 home patients. The Royal Infirmary offers exceptional facilities for practical work to students. Appointments: Five qualified Resident Medical Assistants are appointed every six months and one non-resident Obstetric Assistant. Clinical Clerks and Dressers are attached to the Physicians and Surgeons, and students are appointed as assistants in the Pathological Department. There are in connexion with the clinical courses Tutorial Classes in Medicine and Surgery. Instruction is also given in Practical Pharmacy and Materia Medica and in Practical Dentistry. Further information can be obtained from Dr. Fraser, Medical Superintendent.

ROYAL and DISTRICT ASYLUMS, Dundee (five miles from City). Number of patients, 490.—Physician Superintendent: Dr. William Tuach-Mackenzie. Lectures on Mental Diseases and clinical instruction in connexion with University College, Dundee (University of St. Andrews), are given during the Summer Session at University College and at the Royal and District Asylums by Dr. Tuach-Mackenzie. The course consists of 12 Lectures and 14 Clinical Lectures and Demonstrations. There are two paid qualified Resident Assistants and two unpaid Resident Clinical Assistants. Senior Medical Assistant: Dr. F. W. Lumsden. Junior Medical Assistant: (vacant). Clinical Assistants: Mr. L. Moncrieff and Mr. A. Lumsden.

ABERDEEN ROYAL INFIRMARY.—Contains 251 beds. Consulting Physician: Dr. P. Blaikie Smith. Physicians: Dr. Angus Fraser, Professor Finlay, and Dr. George M. Edmond. Assistant Physicians: Dr. A. H. Lister, Dr. Ashley W. Mackintosh, and Dr. W. R. Pirie. Consulting Surgeons: Professor Alexander Ogston, Dr. J. C. O. Will, and Dr. J. Mackenzie Booth. Surgeons: Mr. J. S. Riddell, Mr. John Marnoch, and Mr. H. M. W. Gray. Assistant Surgeons: Dr. Fred. K. Smith, Dr. Henry Peterkin, and Dr. Wallace Milne. Ophthalmic Surgeon: Dr. C. H. Usher. Assistant Ophthalmic Surgeon: Dr. W. Clark Souter. Gynæcologist: Professor W. Stephenson. Pathologist: Professor David James Hamilton. Assistant Pathologist: Dr. G. M. Duncan. Dental Surgeon: Dr. J. M. P. Crombie. Anæsthetist: Dr. J. J. Y. Dalgarno. Assistant Anæsthetists: Dr. Thos. Fraser and Dr. Alex. Mitchell. Medical Electrician: Dr. J. R. Levack. Assistant Medical Electrician: Dr. Clifford T. Bell. Dermatologist and Lecturer on Diseases of the Skin: Dr. J. F. Christie. Medical Superintendent and Clinical Registrar: Dr. William Sinclair. Clerk and Treasurer and Factor for the Hospital Lands: Mr. A. Scott Finnie, 343, Union-street, Aberdeen.

ABERDEEN ROYAL LUNATIC ASYLUM.—Contains, with hospital attached to main institution and Agricultural Branch, about 986 beds. Medical Superintendent: Dr. William Reid. Assistant Physicians: Dr. Arthur Kellas and Dr. James Laing. Clerk, Treasurer, and Factor: Mr. A. Scott Finnie, 343, Union-street, Aberdeen. Clinical instruction is given to students during three months in summer.

HOSPITALS AFFORDING FACILITIES FOR CLINICAL OBSERVATION.

ROYAL INFIRMARY, Edinburgh.—This hospital has over 900 beds and 60 cots for children, the average daily number of patients for 1907 being 832. Beds are set apart for clinical instruction by the professors of the University of Edinburgh. Courses of Clinical Medicine and Surgery are also given by the ordinary physicians and surgeons. Special instruction is given on Diseases of Women, Physical Diagnosis, Diseases of the Skin, Diseases of the Eye, the Ear, the Larynx, and the Teeth. Separate wards are devoted to Venereal Diseases, Diseases of Women, Diseases of the Eye, the Ear, Throat and Nose, and the Skin, and also to cases of Incidental Delirium or Insanity. There are also large and complete Medical-Electrical and X Ray and Bathing Departments. Three wards are specially set apart for Clinical Instruction to Women Students. Post-mortem examinations are conducted in the anatomical theatre by the pathologist and his assistants, who also give practical instruction in Pathological Anatomy and Histology. The fees for hospital attendance are as follows—viz: Perpetual ticket, in one payment, £12; annual ticket, £6 6*s.*; six months, £4 4*s.*; three months, £2 2*s.*; monthly, £1 1*s.* Separate payments amounting to £12 12*s.* entitle the student to a life ticket. No fees are paid for any medical or surgical appointment. The appointments are as follows:—1. Resident physicians and surgeons are appointed and live in the house free of charge. The appointment is for six months but may be renewed at the end of that period by special recommendation. 2. Non-resident house physicians and surgeons and clinical assistants are appointed for six months. The appointment may be renewed for a like period by special recommendation. 3. Clerks and dressers are appointed by the physicians and surgeons. These appointments are open to all students and junior practitioners holding hospital tickets. 4. Assistants in the Pathological Department are appointed by the pathologist.

Staff: Medical Department.—Consulting Physicians: Dr. Claud Muirhead, Dr. J. O. Affleck, Dr. Andrew Smart, and Dr. Alexander James. Consulting Gynæcologists: Professor Sir J. Halliday Croom and Emeritus Professor Sir A. R. Simpson. *Consulting Physician for Diseases of the Skin*: Dr. W. Allan Jamieson. Professors of Clinical Medicine: Sir T. R. Fraser, Dr. W. S. Greenfield, and Dr. John Wyllie. Ordinary Physicians and Lecturers on Clinical Medicine: Dr. Byrom Bramwell, Dr. Geo. Gibson, Dr. Alex. Bruce, Dr. R. W. Philip, and Dr. W. Russell. Gynæcologists: Dr. A. H. F. Barbour and Mr. N. T. Brewis. Physician for Diseases of the Skin: Dr. Norman Walker. Assistant Physicians: Dr. Murdoch Brown, Dr. G. Lovell Gulland, Dr. J. J. Graham Brown, Dr. Francis D. Boyd, Dr. R. A. Fleming, Dr. Harry Rainy, Dr. Chalmers Watson, and Dr. Edwin Bramwell. Assistant Gynæcologists: Dr. J. Haig Ferguson and Dr. Wm. Fordyce. Assistant Physicians for Diseases of the Skin: Dr. Fred. Gardiner and Dr. R. Cranston Low. Medical Electrician: Dr. Dawson Turner. Assistant Medical Electrician: Dr. Hope Fowler. Medical Registrar: Dr. A. Dingwall Fordyce.

Surgical Department.—Consulting Surgeons: Mr. Joseph Bell, Mr. A. G. Miller, Dr. P. H. Maclaren, and Dr. C. W. MacGillivray. Consulting Ophthalmic Surgeons: Dr. Argyll Robertson and Mr. George A. Berry. Consulting Aural Surgeons: Dr. P. McBride and Dr. McKenzie Johnston. Consulting Dental Surgeon: Dr. John Smith. Regius Professor of Clinical Surgery: Mr. F. M. Caird. Professor of Surgery: Mr. Chiene. Ordinary Surgeons: Mr. J. M. Cotterill, Mr. C. W. Cathcart, Mr. J. W. B. Hodsdon, and Mr. D. Wallace. Ophthalmic Surgeons: Dr. George Mackay and Dr. Wm. G. Sym. Surgeons to Ear and Throat Department: Dr. A. Logan Turner and Dr. J. Malcolm Farquharson. Dental Surgeons: Mr. William Guy and Mr. J. H. Gibbs. Assistant Surgeons: Mr. Alexis Thomson, Mr. Alexander Miles, Mr. J. W. Dowden, Mr. A. A. Scot Skirving, Mr. Geo. L. Chiene, and Mr. W. J. Stuart. Assistant Ophthalmic Surgeons: Dr. J. V. Paterson and Dr. A. H. H. Sinclair. Assistant Surgeons to the Ear and Throat Department: Dr. John S. Fraser and Dr. John D. Lithgow. *Pathologist: Dr. Theodore Shennan.* Assistant Pathologists: Dr. W. T. Ritchie (Clinical Pathology), and Dr. Carnegie Dickson and Dr. J. D Comrie (Morbid Anatomy). Surgical Registrar: Dr. Scott Carmichael. Superintendent: Colonel W. P. Warburton, I.M.S. (retired), M.D., C.S.I.

ROYAL INFIRMARY, Glasgow.—This infirmary, which is the largest in Glasgow, is situated in Cathedral-square, Castle-street, and has car communication with every part of the city. St. Mungo's College is in the infirmary grounds.

of Physicians of London and Edinburgh; by the Royal Colleges of Surgeons, England, Edinburgh, and Ireland; by the Royal College of Physicians of Ireland; by the Faculty of Physicians and Surgeons of Glasgow; by the Society of Apothecaries, London; and by the Army, Navy, and East India Boards. The courses of Laboratory Instruction and Lectures in Public Health are recognised by the Scottish Colleges; by the Royal College of Physicians and the Royal College of Surgeons, Ireland; and by the University of Cambridge. Communications relating to the Medical School to be addressed to the Secretary of the Medical Faculty, Anderson's College Medical School, Glasgow, W. Communications relating to the Preliminary Examination in General Education to be addressed to Mr. Alexander Mackay, Educational Institute Office, 34, North Bridge-street, Edinburgh. Communications relating to the Triple Qualification to be addressed to Mr. Alexander Duncan, LL.D., Faculty Hall, 242, St. Vincent-street, Glasgow. Communications relating to the Dental School to be addressed to Mr. D. M. Alexander, 97, West Regent-street, Glasgow.

The Kerr Bursary in Anatomy (value about £10) is open to students of the Junior Anatomy Class during Winter Session 1908-09.

The Winter Session will be opened on Monday, Oct. 12th, 1908, and will be closed on Thursday, March 18th, 1909.

The Summer Session will be opened on Tuesday, April 20th, 1909, and will be closed on Tuesday, June 29th, 1909.

ST. MUNGO'S COLLEGE AND GLASGOW ROYAL INFIRMARY.—This College was incorporated in 1889. The Glasgow Royal Infirmary was founded in 1791. The Faculty of Medicine of the College occupies new buildings erected for the purposes of a medical school, adjoining and communicating with the Royal Infirmary. The Laboratories, Museums, and Lecture-rooms are equipped and adapted to modern scientific requirements. Recent additions consist of Public Health, Practical Zoology, and Bacteriological Laboratories. A complete electric light installation has been added and a powerful Educational Lantern has been provided for demonstration purposes. The Royal Infirmary, which is at the service of the College for the purpose of clinical and practical instruction, is one of the largest hospitals in the kingdom. The winter session will open on Monday, Oct. 12th.

Psychological Medicine.—Practical instruction is given in Woodilee Asylum, situated within a short distance of Glasgow and having accommodation for 850 patients. Six resident clinical clerks are appointed annually. These clerkships are open to students attending St. Mungo's College.

Clinical Instruction in Fevers.—Classes are conducted by Dr. Johnston, Superintendent, at the City of Glasgow Fever Hospital, Ruchill, and Dr. Brownlee, Superintendent, at the City of Glasgow Fever Hospital, Belvidere.

Clinical Instruction in Midwifery.—The close proximity of the Maternity Hospital enables the Professor of Midwifery to conduct frequent clinical demonstrations there during the summer session.

The classes in St. Mungo's College qualify for the English, Scotch, and Irish Conjoint Boards and, under certain conditions, for the various universities, including the University of London. Students who have fulfilled the conditions of the Carnegie Trust as regards Scottish birth or extraction, age (16 years), and Preliminary Examination, are eligible for the benefits of this Trust during the whole course of their studies at St. Mungo's College.

The fee for each class is £2 2*s.*, except Zoology and Botany, joint fee £3 3*s.*, Anatomy, Winter Session, £4 4*s.*, Pathology, £4 4*s.*, Physics, £2 4*s.* 6*d.*, Public Health Laboratory, £12 12*s.*, and certain extra classes for which the fee is £1 1*s.* The hospital fee (including clinical lectures) is £21 for a perpetual ticket.

The classes in St. Mungo's College are now open to male and female students equally.

The minimum fees for all the lectures, including hospital attendance, necessary for candidates for the Diplomas of the English or Scotch Colleges of Physicians and Surgeons amount to £65. Further particulars can be obtained from a syllabus which may be procured free on application to the Dean, 86, Castle-street, Glasgow.

GLASGOW WESTERN MEDICAL SCHOOL.—This School is situated in University-avenue, close to the University and Western Infirmary. Lectures and Demonstrations are given on Chemistry, on Anatomy, on Surgery, on Physiology, on Midwifery and Gynæcology, on Pathology, on Medicine, and on the Eye. Some of the classes qualify for graduation and for Scotch diplomas.

Class Fees.—For each course of Lectures the fee is £2 2*s.*, or in some cases £1 1*s.* There is no matriculation fee.

Lecturers: Winter Session.—Chemistry (vacant); Anatomy: Dr. Wright Thomson, Tuesday, Wednesday, and Friday, at 4.15 P.M.; Surgery: Dr. Edington, at 12 noon; Midwifery: Dr. Balfour Marshall, at 2 P.M.; Medicine: Dr. Jubb, at 3 P.M.; The Eye: Dr. Fergus, Monday and Thursday, at 4 P.M.

Summer Session.—Chemistry (vacant); Anatomy: Dr. Wright Thomson, Tuesday and Friday, at 3.15 P.M.; Operative Surgery: Dr. Edington, Monday, Wednesday, and Friday, at 1 P.M.; Gynæcology: Dr. Balfour Marshall, at 2 P.M.; Medicine: Dr. Jubb, Monday, Tuesday, and Friday, at 4 P.M.; Ophthalmology: Dr. Fergus, Monday and Thursday, at 11 A.M. and 3 P.M. Some of the above hours are liable to alteration.

QUEEN MARGARET COLLEGE, University of Glasgow.—Queen Margaret College was founded in 1883 by the Glasgow Association for the Higher Education of Women (instituted in 1877), and handsome buildings and grounds near the University were presented to the College in 1884 by Mrs. John Elder. In 1890 a School of Medicine for women was added to its Arts Faculty. In 1892, when the Universities Commissioners issued an ordinance empowering the Scottish University Courts to make provision for the instruction of women, the Council of the College and Mrs. Elder transferred to the University the College, its buildings, grounds, and endowments, on condition that these should be devoted to the maintenance of University classes for women only. The College then became the women's department of the University of Glasgow; its classes are taught by professors of the University and other lecturers appointed by the University Court, and it is governed by the University Court and Senate. The curriculum, regulations, and fees are the same as those of the male students, and the University degrees are open to women on the same conditions as to men. They have access to the University Museum and can borrow books from the University Library, besides having a library of reference in Queen Margaret College. The number of students enrolled in session 1907-1908 was 631, of whom about 70 were studying medicine and the rest arts or science. The School of Medicine is a special feature of the College, and gives full preparation for the medical degrees of the University. In July, 1894, for the first time in the history of any Scottish university, women students graduated in medicine at the "capping" in Glasgow University. 131 women have now taken the degree of M.B., C.M., or M.B., Ch.B. of the University of Glasgow. The women students work in the University laboratories for Physics, Zoology, Botany, Physiology, Pathology, Medical Jurisprudence, and Public Health, and have special laboratories for Chemistry and Anatomy at Queen Margaret College. Excellent facilities for clinical work are given in the Royal Infirmary, in the New Maternity, and other hospitals. By a gift of £5000 granted for the purpose by the Bellahouston Trust the University Court was enabled to add to the College a large building for the study of Anatomy and other medical subjects which was opened in October, 1895. The Arthur Scholarship is open every third year to students of first year; other Bursaries are open in Arts and Medicine; and by an ordinance of the Universities Commissioners women are admitted to certain University bursaries, scholarships, and fellowships. A house of residence for the students of the College coming from a distance was opened by the Queen Margaret Hall Co., Limited, in October of 1894. The Winter Session commences on Oct. 12th.

Lecturers (other than University Professors).—Anatomy: Dr. T. H. Bryce. Chemistry: Dr. H. W. Bolam. Materia Medica: Dr. W. MacLennan. Medicine: Dr. W. K. Hunter.

of the Throat and Nose: Dr. J. Walker Downie. Honorary Consulting Physician for Mental Disorders: Dr. R. L. Oswald. Consulting Medical Electrician: Dr. D. J. Mackintosh, M.V.O. Medical Electricians: Dr. J. G. Tomkinson, Dr. Archd. Hay, and Dr. W. F. Somerville. Pathologist: Dr. Robert Muir. Assistant Pathologists: Dr. J. H. Teacher and Dr. M. L. Taylor. Vaccinator: Dr. J. W. Nicol. Dental Surgeon: Mr. W. D. Woodburn, L.D.S. Superintendent: Dr. Donald J. Mackintosh, M.V.O. Matron: Miss H. Gregory Smith. Secretary and Treasurer: Henry Johnston, 87, Union-street. Assistant Secretary: J. Matheson Johnston, C.A.

Royal Hospital for Sick Children, Glasgow.—The Hospital at Garnethill was opened in December, 1882, and in June, 1903, a country branch consisting of two wards was opened at Drumchapel. The number of beds in the town hospital and country branch together is 100. A specially designed Dispensary, or Out-patient Department, was opened in October, 1888, in West Graham-street. The whole institution is for non-infectious cases and is available to medical students for clinical instruction in the diseases peculiar to childhood. Classes are formed both at Hospital and Dispensary at the beginning of the University session in October. Students may be enrolled at any time. Fee £1 1s. per annum, admitting to both Hospital and Dispensary. Further particulars on applying to the House Surgeon, 45, Scott-street, Garnethill, Glasgow. Physicians: Dr. Samson Gemmell and Dr. George S. Middleton. Surgeons: Mr. T. Kennedy Dalziel and Mr. R. H. Parry.

Glasgow Ophthalmic Institution, 126, West Regent-street (29 beds and six cots).—Clinical and systematic course of lectures for students during the winter and summer sessions. In-patients, 1076; out- or dispensary patients, 11,095. Operations on Wednesdays and Saturdays. Honorary Consulting Surgeon: Dr. D. N. Knox. Surgeon: Dr. A. Maitland Ramsay. Assistant Surgeons: Dr. John Rowan, Dr. H. Wright Thomson, and Dr. John Gilchrist. Pathologist: Dr. Mary Hannay. Bacteriologist: Dr. J. Campbell McClure. Electrician: Dr. John Gilchrist. Anæsthetist: Dr. R. H. Henderson. House Surgeon: Dr. J. R. Kerr. This institution is the Ophthalmic Department of the Royal Infirmary. A post-graduate course is given by Dr. Ramsay and assistants during September. Clinical instruction is given in the summer session to students of the University and Queen Margaret College and in winter to students of St. Mungo's College and to all who take the class.

Glasgow Eye Infirmary, Berkeley-street and Charlotte-street.—This institution, the largest of its kind in Scotland, was founded in 1824. The Infirmary now consists of two large buildings—that in Berkeley-street being occupied as the Infirmary proper, and that in Charlotte-street (new buildings opened June, 1894) as a dispensary. The Infirmary is devoted exclusively to the treatment of Diseases of the Eye, and is intended primarily to provide treatment, and, when necessary, board and lodging, for those who are unable to do so for themselves. The average number of new patients for the last ten years has been 21,773·7, and the total number of cases treated in 1907 was 27,922. The Medical Staff is as follows:—Surgeons: Dr. Thomas S. Meighan, Dr. A. Freeland Fergus, Dr. Andrew Wilson, Dr. James Hinshelwood, Dr. Leslie Buchanan, and Dr. W. Ernest F. Thomson. Assistant Surgeons: Dr. A. Lewis M'Millan, Dr. Henry L. G. Leask, Dr. W. Cochrane Murray, Dr. Brownlow Riddell, Dr. Arthur J. Ballantyne, and Dr. Arthur Yost. Pathologist: Dr. W. B. Inglis Pollock. House Surgeon: Dr. A. Cappie Russell. Assistant House Surgeon: Dr. Wm. Grier.

Regulations as to Attendance of Students.—(1) Gentlemen may attend as students on payment to the treasurer of the following fees:—For six months £1 1s., 12 months £2 2s. (2) All students when duly entered in the Infirmary Register may attend the clinical instruction of any or every member of the medical staff on production of their tickets. The days on which the surgeons respectively attend to receive patients may be ascertained at the Infirmary. Students have the privilege of being present in the Dispensaries at such hours as are arranged. They may enter the wards along with the surgeon whose clinique they are attending when he visits his patients. They may also be present at operations under the sanction of the surgeon operating, but no student may enter the wards or operating-room except under the aforesaid regulation. Students may be allowed the use of the journals and case-books for examination on applying to the House Surgeon. The wards and dispensary are recognised by the University of Glasgow for the purpose of instruction in ophthalmology for graduation in medicine. Joint Secretaries and acting Treasurers: William George Black and Harold John Black, 88, West Regent-street, Glasgow. The medical session opens in October.

IRISH SCHOOLS OF MEDICINE.[1]

Royal College of Surgeons in Ireland (Schools of Surgery).—The schools of surgery are attached by Charter to the Royal College of Surgeons and have existed as a department of the College for over a century. They are carried on within the College buildings and are specially subject to the supervision and control of the Council, who are empowered to appoint and remove the professors and to regulate the methods of teaching pursued. The buildings have been reconstructed, the capacity of the dissecting-room nearly trebled, and special pathological, bacteriological, public health, and pharmaceutical laboratories fitted with the most approved appliances in order that students may have the advantage of the most modern methods of instruction. A refreshment-room is now open where students can have luncheon. There are special rooms set apart for lady students. The entire building is heated by hot-water pipes and lighted throughout by the electric light. Winter Session commences Oct. 15th; Summer Session, April 1st. Prospectuses and guide for medical students can be obtained post free on written application to the Registrar, Royal College of Surgeons, Stephen's-green, W., Dublin.

Queen's College School of Medicine, Belfast.—Ten Junior Scholarships have been founded in the Faculty of Medicine of the annual value of £20 each. Two are tenable by matriculated students of the first, second, third, fourth, and fifth years of their course respectively. The examinations for Scholarships take place at the commencement of the session. A Travelling Medical Scholarship, value £100, will be awarded in the spring of 1909. Class Prizes are awarded at examinations which take place at the close of the session. The Exhibitions, &c., of the Royal University of Ireland are also open to students. Lectures in Medicine at Queen's College, Belfast, will commence on Oct. 20th and end on March 31st. The Summer Medical Classes will begin on May 3rd, except Botany, which begins on March 22nd. The Donald Currie Chemical Buildings contain a lecture theatre, a preparation room, a chemical museum, a large class-room for elementary practical chemistry, laboratories for qualitative and quantitative analysis, rooms for water and gas analysis, dark room for photographic purposes, balance room, &c., provided with all modern appliances. Special facilities are given to those who wish to pursue original research. The Anatomical Department contains a large and well-lighted dissecting-room, a lecture-room, a professor's and demonstrator's room, a bone-room, and a laboratory for microscopic and photographic work. The medical museum is in the same building. The Jaffé Laboratories for Physiology comprise a lecture theatre, laboratories for practical work in chemical physiology, histology, and experimental physiology, and in addition small private research rooms, including balance, galvanometer, and centrifuge rooms. The Musgrave Pathological Laboratory.—In this department opportunity is afforded for research in pathology and bacteriology. The department is in touch with most of the hospitals in Belfast, and there is an ample supply of material for investigation by graduates in morbid histology, clinical pathology, and the bacteriology of infectious diseases. A course in pathology or bacteriology is given to graduates, and members of this class have an opportunity of seeing the methods employed in the various investigations carried out in the department for the Public Health Committee of the corporation in connexion

---

[1] The Irish Universities Bill, if it becomes law, will alter much that here described.

The infirmary has, including the Ophthalmic Department, over 620 beds, the average number occupied in 1905 being 600. When the reconstruction of the infirmary, which was begun three years ago, is completed it will have about 700 beds. There are special beds and wards for diseases of women, of the throat, nose, and ear, venereal diseases, burns, and septic cases. Wards are set apart for the teaching of Women Students. At the Out-door Department the attendances in 1907 numbered over 140,000. In addition to the large medical and surgical departments there are departments for special diseases—viz., diseases of women, of the throat and nose, of the ear, of the eye, of the skin, and of the teeth. Five house physicians and nine house surgeons, having a legal qualification in medicine and surgery, who board in the hospital free of charge, are appointed every six months. Clerks and dressers are appointed by the physicians and surgeons. As a large number of cases of acute diseases and accidents of a varied character are received these appointments are very valuable and desirable. A fully equipped Electrical Pavilion was opened a few years ago and year by year the latest and most approved apparatus for diagnosis and treatment has been added. The fees for hospital attendance, including clinical lectures and tutorial instruction, attendance at the out-door department, at the pathological department, post-mortem examinations, and the use of the museum, which has recently been re-arranged and catalogued, are as follows: For one year, £10 10*s.*; for six months, £6 6*s.*; for three months, £4 4*s.* Students who have paid fees to the amount of £21 to the Glasgow Royal Infirmary shall be permitted to attend in any subsequent year or years one winter and one summer course of instruction in the infirmary without further payment; and students who have paid to any other hospital in the United Kingdom fees, being not less than £21, in virtue of which they are entitled to attend without further payment, shall be admitted as students of the Royal Infirmary on payment of £3 3*s.* for six months or £1 11*s.* 6*d.* for three months.

Staff.—Visiting Physicians: Dr. D. S. Middleton, Dr. T. K. Monro, Dr. W. K. Hunter, Dr. J. M. Cowan, and Dr. J. B. Mackenzie Anderson. Visiting Surgeons: Mr. John Barlow, Mr. J. A. Adams, Mr. David Newman, Mr. Q. McLennan, Mr. J. H. Pringle, Mr. H. Rutherfurd, and Mr. P. Paterson. Consulting Surgeon for Diseases of the Eye: Dr. A. Maitland Ramsay. Surgeon for Diseases of the Throat and Nose and Consulting Medical Electrician: Mr. J. Macintyre. Gynæcologist: Dr. Balfour Marshall. Surgeon for Diseases of the Ear: Mr. J. Kerr Love. Pathologist and Curator of Museum: Dr. Hugh Galt. Assistant Pathologist: Dr. Mary Baird Hannay. Bacteriologist: Mr. David McCrorie. Assistant Bacteriologists: Mr. J. A. Campbell and Dr. Lizzie T. Fraser. Medical Electrician: Mr. J. R. Riddell. Assistant Medical Electricians: Dr. Samuel Capie, Katharine M. Chapman, L.R.C.P. Edin., and Dr. Janie S. McLauchlan. Anæsthetist: Dr. John Donald. Vaccinator: Dr. H. H. Borland. Dispensary Physicians: Mr. David McCrorie, Dr. John Henderson, Dr. Campbell S. Marshall, Dr. James Scott, Dr. J. T. McLachlan, and Dr. A. W. Harrington. Extra Dispensary Physicians: Dr. Archibald Jubb, Dr. Dugald McPhail, and Dr. Wm. H. Brown. Dispensary Surgeons: Mr. A. N. McGregor, Mr. John Patrick, Mr. John A. C. Macewen, Mr. A. C. Faulds, Mr. Thomas Kay, and Mr. Robert Ramsey. Extra Dispensary Surgeons: Mr. James Battersby, Mr. Donald Duff, and Mr. Spencer Mort. Dispensary Specialists:—Diseases of Women: Dr. Peter McBryde, Dr. W. D. Macfarlane, and Dr. A. G. Banks; Diseases of the Ear: Dr. James Adam; Diseases of the Skin: Dr. Alexander Morton and Dr. G. McIntyre; Diseases of the Throat and Nose: Dr. R. Fullerton and Dr. Grant; Diseases of the Eye: Dr. J. Rowan, Dr. H. W. Thomson, and Dr. J. H. McIlroy; Diseases of the Teeth: Mr. W. Taylor and Mr. Taylor, jun. Superintendent: Dr. J. Maxtone Thom.

ROYAL HOSPITAL FOR SICK CHILDREN, Sciennes-road, Edinburgh.—This hospital contains 120 beds, and is fitted with every modern improvement. A fully equipped out-patient department (medical and surgical) is conducted daily in a building adjoining the hospital. Systematic courses of instruction, which qualify for graduation in the Edinburgh University and elsewhere, are given from time to time throughout the year by the staff. Students may enter at any time. Full particulars can be obtained from the Registrar at the hospital.

Staff.—Consulting Physician: Dr. J. Carmichael Consulting Surgeon: Dr. J. Bell. Consulting Surgeon-Dentist: Mr. J. Smith. Pathologist: Dr. S. McDonald. Ordinary Physicians: Dr. G. H. M. Dunlop, Dr. J. Thomson, and Dr. J. S. Fowler. Surgeon: Mr. H. J. Stiles. Ophthalmic Surgeon: Mr. G. A. Berry. Assistant Surgeon: Mr. E. W. S. Carmichael. Medical Electrician: Dr. J. W. Spence. Extra Physicians: Dr. W. B. Drummond, Dr. J. W. Simpson, and Dr. Dingwall Fordyce. Anæsthetists: Dr. D. C. A. M'Allum and Dr. J. Politachi.

EYE, EAR, AND THROAT INFIRMARY OF EDINBURGH, 6, Cambridge-street, Lothian-road.—Clinical Lectures and Instruction are given in this institution, which is open at 1 o'clock daily for outdoor patients for Eye Diseases; Mondays, Thursdays, and Saturdays at 12 noon, and Tuesdays and Fridays at 4 P.M. for out-door Ear, Nose, and Throat Patients. Special Practical Ophthalmoscopic Classes by arrangement. Patients whose diseases require operations or more than ordinary care are accommodated in the house. Consulting Surgeons: Dr. Joseph Bell, Dr. Logan Turner (Ear, Nose, and Throat Department). Surgeons: Dr. William George Sym, Dr. Malcolm Farquharson, Dr. J. V. Paterson, Dr. E. M. Lithgow, and Dr. W. G. Porter. Honorary Anæsthetist: Mr. J. H. Gibbs. Dental Surgeon: Mr. G. W. Watson. Treasurer and Secretary: Mr. J. P. Watson, W.S., 32, Charlotte-square.

GLASGOW WESTERN INFIRMARY.—This hospital adjoins the University of Glasgow. Number of beds upwards of 520. Special wards are set apart for Diseases of Women and for Affections of the Skin. In the out-patient department there are special cliniques for Diseases of Women and for Diseases of the Throat, Ear, and Teeth. The Clinical Courses are given by the physicians and surgeons, each of whom conducts a separate class, and students require to enter their names at the beginning of the session for the class which they propose to attend. Special instruction is given to junior students by tutors or assistants, and clinical clerks and dressers are selected from the members of the class. All the courses of clinical instruction are recognised by the University of Glasgow and the other boards in the kingdom. In the Pathological Department the course is both systematic and practical, also post-graduate courses, and extends through the winter and following summer; these are likewise recognised by the University for graduation. Fourteen resident assistants are appointed annually, without salary, from those who have completed their course. The fee for hospital attendance is £10 10*s.* and the fees for clinical instruction are £3 3*s.* for the Winter Session and £2 2*s.* for the Summer Session.

Staff.—Honorary Consulting Physician: Dr. G. P. Tennant. Honorary Consulting Surgeon: Dr. Alex. Patterson. Honorary Consulting Gynæcologist: Dr. W. L. Reid. Visiting Physicians: Dr. Samson Gemmell, Dr. Ralph Stockman, and Dr. John Lindsay Steven. Visiting Surgeons: Sir Hector C. Cameron, Sir W. Macewen, Dr. J. C. Renton, Dr. George T. Beatson, C.B., Dr. T. K. Dalziel, and Dr. James H. Nicoll. Physicians for Diseases of Women: Dr. Murdoch Cameron and Dr. John M. Munro Kerr. Assistant Physicians: Dr. W. G. Dun, Dr. R. B. Ness, Dr. William MacLennan, and Dr W. R. Jack. Assistant Surgeons: Dr. Duncan Macartney, Dr. Robert Kennedy, Dr. Alfred A. Young, Dr. G. B. Buchanan, Dr. John Morton, and Dr. G. H. Edington. Dispensary Physicians: Dr. John S. M'Kendrick, Dr. Robert Fullarton, Dr. John Gracie, Dr. J. Campbell McClure, Dr. Frank Charteris, and Dr. A. B. Sloan. Dispensary Surgeons: Dr. Farquhar Macrae, Dr. Alex. MacLennan, Dr. Archd. Young, Dr. M. L. Taylor, Dr. W. W. Christie, and Dr. C. C. Cuthbert. Anæsthetists: Dr. James P. Boyd, Dr. Horne Henderson, Dr. Dingwall Kennedy, and Dr. John W. Renton. Dispensary Physician for Diseases of Women: Dr. S. Cameron and Dr. David Dickie. Extra Dispensary Physicians: Dr. Leonard Findlay. Dr. John P. Duncan, Dr. Murray Ross Taylor, Dr. Geo. A. Allan, and Dr. Jas. R. C. Greenlees. Extra Dispensary Surgeons: Dr. A. H. Edwards, Dr. R. B. Carslaw, Dr. Wm. Rankin, Dr. J. Mill Renton, and Dr. John S. Barr. Extra Dispensary Physicians for Diseases of Women: (vacant). Dispensary Surgeon for Diseases of the Ear: Dr. Thomas Barr. Assistant Dispensary Surgeon for Diseases of the Ear: Dr. J. Stoddart Barr. Honorary Consulting Ophthalmic Surgeon: Dr. Thomas Reid. Dispensary Surgeon for Diseases

Elementary Biology: Dr. D. J. Coffey. Elementary Physics: Mr. P. J. Fagan.

HOSPITALS AFFORDING FACILITIES FOR CLINICAL OBSERVATION.

Adelaide Medical and Surgical Hospitals, Peter-street, Dublin.—Fee for nine months' hospital attendance, £12 12*s.*; six months, £8 8*s.* Summer, three months, £5 5*s.*

Staff.—Physicians: Dr. James Little, Dr. Wallace Beatty, and Dr. H. T. Bewley. Surgeons: Mr. F. T. Heuston and Mr. T. E. Gordon. Obstetric Surgeon: Sir W. J. Smyly. Ophthalmic Surgeon: Sir H. R. Swanzy. Throat Surgeon: Dr. S. Horace Law. Pathologists and Bacteriologists: Dr. J. Alfred Scott and Dr. W. Geoffrey Harvey. Dental Surgeons: Dr. Theodore Stack and Mr. John Stanton. Assistant Physician: Dr. G. Peacocke. Assistant Surgeon: Dr. K. E. Levison-Gower Gunn. House Surgeons: Dr. J. L. Phibbs and Dr. W. S. Thacker.

Two resident surgeons are elected yearly and four resident pupils half-yearly. At the termination of the session prizes in Clinical Medicine and Surgery and in Dermatology will be awarded.

Hudson Scholarship.—In addition to the junior prizes the Hudson Scholarship, £30 and a gold medal, as well as a prize of £10, together with a silver medal, will be awarded at the end of the session for proficiency in Clinical Medicine and Medical Pathology, Clinical Surgery and Surgical Pathology, Pathological Histology, Surgical Appliances, including instruments and bandaging, Ophthalmology, Gynæcology, and Dermatology.

The certificates of attendance are recognised by all the Universities and licensing bodies in the United Kingdom. Further particulars may be obtained from Mr. F. T. Heuston.

Coombe Lying-in Hospital and Guinness Dispensary for the Treatment of Diseases Peculiar to Women, Dublin.—This hospital contains nearly 70 beds and consists of two divisions, one of which is devoted to lying-in cases and the other to the treatment of diseases peculiar to women. The practice of this hospital is one of the largest in Ireland; nearly 18,000 cases are treated annually, either as intern or extern patients. Lectures are delivered, practical instruction given, and gynæcological operations are performed in the theatres daily. There is a general dispensary held daily, at which instruction is given on the Diseases of Women and Children. There is a special afternoon dispensary held by the Master and his assistants, at which practical instruction in gynæcology is given. This is the largest dispensary of its kind in Dublin. There is no extra charge for attendance at this dispensary. There is accommodation for intern pupils who enjoy exceptional advantages of acquiring a thorough knowledge of this branch of their profession. Lady medical students can reside in the hospital. Clinical assistants are appointed from amongst the pupils as vacancies occur. Certificates of attendance at this hospital are accepted by all licensing bodies, and the diploma is recognised by the Local Government Board as a full legal midwifery qualification. The resident quarters have been much enlarged. A billiard table has been erected for the use of students. Fees: Extern pupils for full course of six months, £8 8*s.*; three months, £4 4*s.* Intern pupils, one month, £4 4*s.*; each consecutive month, £3 3*s.*; six months, £18 18*s.*; board and lodging in the hospital, 18*s* per week. Lady students' intern, one month, £5 5*s.*; each consecutive month, £4 4*s.* Registration fee, in advance, 10*s.* 6*d.* Students can enter for attendance at any time, but preference is given to those entering from the first day of the month. Further particulars may be had on application to the Master or the Registrar at the hospital.

Staff.—Consulting Physicians: Sir John W. Moore and Dr. J. M. Redmond. Consulting Surgeons: Dr. F. T. Heuston and Dr. F. W. Kidd. Pathologist: Dr. E. J. McWeeney. Pathological Analyst: Sir C. A. Cameron. Master: Dr. M. J. Gibson. Assistant Masters: Dr. W. D S Johnstone and Dr. Victor J. McAllister. Registrar: Fred. A. Heney.

Sir Patrick Dun's Hospital Grand Canal-street, Dublin.—Classes for clinical instruction both in Medicine and Surgery are held each morning from 9 o'clock from Oct. 1st till the end of June. Special classes for students commencing their hospital studies will be held in the wards during the months of October, November, and December. They will embrace the elements of Medicine and Surgery, including note-taking. The surgical operating theatre, which has recently been erected, is equipped upon the most approved principles and is thoroughly in accord with modern surgical requirements. Instruction in the Diseases of Women is given Tuesday and Friday at 10 A.M. by Sir Arthur V. Macan. There is a special wing devoted to fever cases. Pathological and Bacteriological Demonstrations will be given each Friday at 10.30 A.M. during the Winter and Summer Sessions in the new Pathological Laboratory. A new department has been opened for the special treatment of Throat, Nose, and Ear diseases under the direction of Dr. R. H. Woods. Instruction will be given in these subjects and in the use of the Laryngoscope and Otoscope. to senior students on Mondays and Thursdays. Opportunities are given the members of the hospital class of seeing the various applications of the x rays to the diagnosis and treatment of injury and disease Opportunities are also afforded in the out-patient department for the diagnosis and treatment of the numerous minor ailments not met with in the hospital wards. Demonstrations are given upon Diseases of the Skin. A Resident Surgeon, with salary, is appointed annually. The election takes place at the end of December. Four Resident Pupils are appointed each half-year. Six Surgical Dressers and six Clinical Clerks are appointed each month.

Prizes and Medals.—Clinical medals and prizes will be awarded in Medicine and in Surgery respectively in accordance with the will of the late Rev. Samuel Haughton, M.D., S.F.T C.D. Candidates who fail to obtain these medals and prizes will be awarded special certificates in Medicine and in Surgery provided they show sufficient merit. The next examination will be held in April, 1909.

Fees.—Winter and summer session, £12 12*s.*; winter session (six months), £8 8*s.*; and summer session (three months), £5 5*s.* The practice of this hospital is open to students of Medicine in attendance on schools other than the School of Physic, the certificates being recognised by the Royal University and Royal Colleges of Surgeons of England, Ireland, and Scotland.

Consulting Physician: Dr. J. M. Purser. Physicians: Dr. W G. Smith. Dr. J. Magee Finny, Dr. H. C. Drury. and Sir Arthur V. Macan. Assistant Physician: Dr. E. J. Watson Surgeons: Sir Charles B Ball, Dr. E H. Taylor, and Dr C. A. K. Ball. Pathologist: Dr A. C. O'Sullivan.. Department for Throat, Nose, and Ear: Dr. R. H. Woodss Assistant Surgeon: Dr. C. M. Benson. X Ray Department: Dr. E J. Watson. House Surgeon: Dr. R. E. Wright.

Further information will be supplied by the Secretary to the Medical Board, Dr. H. C. Drury.

Mercer's Hospital.—This hospital, founded in 1734, is situated in the centre of Dublin, in the immediate vicinity of the Schools of Surgery of the Royal College of Surgeons, the Catholic University School of Medicine. and within five minutes' walk of Trinity College. It contains 120 beds for medical and surgical cases, and arrangements have been made with the medical officers of Cork-street Fever Hospital whereby all students of this hospital are entitled to attend the clinical instruction of that institution and become eligible for the posts of Resident Pupil, &c. There is a large out-patient department and a special department for diseases peculiar to women. There are also special wards for the treatment and study of children's diseases. During the past few years the hospital has undergone extensive alterations in order to bring it up to modern requirements.

Appointments.—A House Surgeon is appointed annually. Five Resident Pupils, each for six months, and Clinical Clerks and Dressers are appointed monthly from amongst the most deserving members of the class.

Fees.—Winter. six months. £8 8*s.*; Summer, three months, £5 5*s.*; nine months, £12 12*s.*

Consulting Physician: Dr. J. Magee Finny. Consulting Surgeon: Mr. H. Fitzgibbon. Consulting Ophthalmic Surgeon: Mr. J. B. Story. Physicians: Dr. E. L'Estrange Ledwich and Dr. J. Lumsden. Surgeons: Mr. R. C. B Maunsell, Mr. S. S Pringle, and Mr. W. Ireland de C. Wheeler.

with water-supply, sewage disposal, meat- and milk-supply, the diagnosis of cases of infectious diseases, &c. The certificate issued to members of the class in bacteriology qualifies for the D.P.H. degree. The pharmaceutical laboratory is fitted and equipped for the work of practically instructing students in the compounding and dispensing of medicines.

Professors and Lecturers—Natural Philosophy: W. Blair Morton, M.A. Chemistry: E. A. Letts, D.Sc., F.R.S.E. Natural History: Gregg Wilson, D.Sc. Anatomy: Johnson Symington, M.D., F.R.S. Physiology (Dunville): T. Hugh Millroy, M.D. Medicine: J. A. Lindsay, M.D., F.R.C.P. *Surgery: T. Sinclair, F.R.C.S. Midwifery: Sir John W.* Byers, M.D. Pathology (Musgrave): W. St.C. Symmers, M.B. Materia Medica: Sir William Whitla, M.D. Medical Jurisprudence: W. St.C. Symmers, M.B., and T. Houston, M.D. Ophthalmology: C. E. Shaw, M.D. Sanitary Science: E. A. Letts, D.Sc., and W. J. Wilson, M.B. Vaccination: J. McLiesh, M.B., D.P.H.

Clinical instruction is given at the Royal Victoria Hospital, the medical staff of which is as follows:—Physicians: Professor Sir William Whitla, Professor James A. Lindsay, Dr. William Calwell, and Dr. H. L. McKisack. Surgeons: Mr. J. Walton Browne, Professor T. Sinclair, Mr. A. B. Mitchell, and Mr. T. S. Kirk. Gynæcologist: Professor Sir John Byers. Surgeon for Diseases of the Eye, Ear, and Throat: Mr. James A. Craig. Pathologist: Professor W. St.C. Symmers. Physician for Diseases of the Skin: Dr. W. Calwell. Assistant Physicians: Dr. W. B. McQuitty and Dr. J. S. Morrow. Assistant Surgeons: Mr. Robert Campbell and Mr. Andrew Fullerton. Assistant to the Gynæcologist: Mr. R. J. Johnstone. Assistant Surgeon Eye, Ear, and Throat Department: Mr. Henry Hanna. Assistant to the Pathologist: Dr. David Kirkhope. Administrators of Anæsthetics: Dr. V. G. L. Fielden, Dr. M. B. Smith, and Dr. F. C. Smyth. Medical Electrician: Dr. J. C. Rankin. Hæmatologist: Dr. Thomas Houston. Medical Tutor: Dr. S. H. G. Blakely. Surgical Tutor: Mr. Howard Stevenson. Registrars: Dr. J. E. MacIlwaine and Dr. S. T. Irwin. The Belfast Union and Fever Hospitals, the Ulster Hospital for Diseases of Women and Children, the Maternity Hospital, the Ophthalmic Hospital, the Ulster Eye, Ear, and Throat Hospital, the Hospital for Sick Children, and the District Lunatic Asylum are open to students. Full information can be had from the Registrar, Queen's College, Belfast.

QUEEN'S COLLEGE SCHOOL OF MEDICINE, Cork.—The building is provided with a very large, well-ventilated dissecting room supplied with electric light, with physiological, toxicological, pathological, and pharmaceutical laboratories, materia medica, anatomical and pathological museums, as well as a collection of surgical and obstetrical instruments and appliances. There are well-appointed physical, chemical, and biological laboratories, and a large natural history museum in the adjoining building, and part of the College ground is laid out as a botanical garden. The plant houses are well filled with plants and are open to the students in the class of Botany.

Fees.—For Practical Anatomy, Practical Physiology and Histology, and for Practical Chemistry, £3 each course; for Physiology, £3 first course, and £2 for each subsequent course. Other medical classes, £2 first course, and £1 each subsequent course.

Eight scholarships (value about £30 each), as well as several exhibitions and class prizes, are open to students in their first four years and the Blayney Scholarship, value £32, and a Senior Exhibition to students in their fifth year.

Students can attend the North and South Infirmaries, the Cork Union Hospital, the Cork Fever Hospital, the County and City of Cork Lying-in Hospital, the Cork Maternity, the County and City of Cork Hospital for Diseases of Women and Children, the Cork Eye, Ear, and Throat Hospital, and the Cork District Lunatic Asylum.

Staff, North Infirmary.—Physicians: Dr. D. D. Donovan and Dr. E. Magner. Surgeons: Dr. Cotter, Dr. C. Y. Pearson, Dr. N. J. Hobart, and Dr. D. J. O'Mahony. Assistant Physician: Dr. R. B. Dalton. Assistant Surgeons: Dr. J. Dundon and Dr. R. P. Byrne. Pathologist: Dr. Denis Murphy. House Physician: Dr. D. F. Hegarty. House Surgeon: Dr. D. M. Donovan. Surgeon Dentist: Mr. W. Pericho.

Staff, South Charitable Infirmary.—Physicians: Dr. P. T. O'Sullivan and Dr. N. I. Townsend. Surgeons: Dr. H. R. Townsend, Dr. H. Corby, and Dr. T. G. Atkins. Ophthalmic Surgeon: Dr. A. W. Sandford. Extern Physicians: Dr. E. V. Cantillon and Dr. E. W. Allsom. Extern Surgeon: Dr. R. P. Crosbie. House Physician: Dr. M. V. Shanahan. House Surgeon: Dr. J. P. Higgins. Dentist: Mr. T. C. Butterfield.

Professors—Natural Philosophy: W. Bergin, M.A. Chemistry: A. E. Dixon, M.D. Anatomy: B. C. Windle, M.D. Physiology: D. T. Barry, M.D. Medicine: W. E. Ashley Cummins, M.D. Surgery: C. Yelverton Pearson, F.R.C.S. *Materia Medica: John Dundon, M.D. Midwifery:* H. Corby, M.D.

Medical session opens Oct. 20th, 1908.

QUEEN'S COLLEGE SCHOOL OF MEDICINE, Galway.—There are eight Junior Scholarships in Medicine of the annual value of £25 each. Two are tenable by matriculated students of the first, second, third, and fourth years. The Council has power to award exhibitions for distinguished answering. Sessional prizes are offered in each subject. Scholarship examinations are held at the commencement and those for Sessional Prizes at the close of each session. The Medical lectures are recognised by the Royal University of Ireland and the various Licensing Bodies in the United Kingdom. The College contains well lighted and ventilated dissecting room and anatomical lecture theatre; physiological, pharmaceutical, chemical, and physical laboratories; anatomical, pathological, gynæcological, and materia medica museums; as well as a large natural history and geological museum and an extensive library in which students can read and from which they can borrow books. Clinical instruction is given in the Galway Hospital and in the Galway Union and Fever Hospitals. The following constitute the medical staff of the Galway Hospital.—Physicians: Professor Kinkead and Professor Lynham. Surgeons: *Professor* Pye, Professor Colahan, and Professor Brereton. Gynæcologist: Professor Kinkead. House Surgeon: Dr. Rouse. Instruction at the Galway Union and Fever Hospital is given by Professor Colahan and Dr. McDonogh. There are extensive grounds, a portion of which is occupied by a Botanic Garden and a part is at the disposal of the College Athletic Union. A prospectus containing full information as to courses of lectures, scholarships, and fees for classes can be obtained on application to the Registrar, Queen's College, Galway.

Professors—Natural Philosophy: A. Anderson, LL.D. Chemistry: A. Senier, Ph.D. Natural History; R. J. Anderson, M.D. Anatomy and Physiology: J. P. Pye, M.D., D.Sc. Medicine: J. I. Lynham, M.D. Surgery: W. Westropp Brereton, L.R.C.S.I. Materia Medica: N. W. Colahan, M.D. Midwifery: R. J. Kinkead, M.D.

THE MEDICAL SCHOOL OF THE CATHOLIC UNIVERSITY, IRELAND, DUBLIN.—Founded in 1855, it is now the largest medical school in Ireland. It prepares students specially for the examinations of the Royal University and the Conjoint Colleges of Ireland and Edinburgh, but its lectures and practical courses are recognised by all the Licensing Bodies in Great Britain and Ireland. In addition to the ordinary medical examinations it prepares students for the D.P.H. and for the various higher University examinations in Pathology, Physiology, Chemistry, &c. One medical scholarship, six exhibitions, numerous gold and silver medals, and special prizes in anatomy, chemistry, and physics are offered annually for competition. The school opens for dissections on Oct. 1st; the winter lectures begin on Nov. 2nd. The Summer Session commences on April 1st.

Lecturers—Anatomy: Dr. E. P. McLoughlin, assisted by Mr. P. J. Fagan, Dr. G. M. Keating, and Mr. T. T. O'Farrell. Physiology: Dr. D. J. Coffey, M.A., M.B., and Dr. C. Coppinger, M.D., Emeritus Professor. Chemistry: Mr. Hugh Ryan, D.Sc., assisted by Mr. G. Ebrill, B.A. Surgery: Mr. J. S. M'Ardle, assisted by Mr. A. J. Blayney. Medicine: Sir Christopher Nixon, Bart. Midwifery: Dr. Alfred J Smith. Pathology and Bacteriology: Dr. Edmond J. McWeeney. Physics: Mr. J. A. M'Clelland. Biology: Dr. George Sigerson. Practical Biology: Mr. James B. Butler. Ophthalmology: Dr. Louis Werner. Sanitary Science: Dr. E. J. McWeeney (temporary). Materia Medica: Dr. M. J. Dempsey. Medical Jurisprudence: Dr. E. J. McWeeney (temporary). Practical Pharmacy: Mr. M. R. Hayes.

SCHOLARSHIPS GIVEN IN AID OF MEDICAL STUDY.

INSTITUTION.	TITLE OF SCHOLARSHIP, &c.	ANNUAL OR TOTAL VALUE.	HOW LONG TENABLE.	HOW OBTAINABLE.	CONDITIONS ATTACHED TO TENURE.
LONDON UNIVERSITY*	No. 1.	£40 per annum.	1 year.	Awarded to the most meritorious of those candidates, whether internal or external, who, having passed the whole Intermediate Examination in Medicine at one time, have been awarded sufficient marks of distinction in (1) ANATOMY, or (2) PHYSIOLOGY, or (3) PHARMACOLOGY.	No candidate will be allowed to receive the income of more than one scholarship at the same time. They will be awarded in the year 1903 only.
	No. 2.	£40 per annum.	1 year.		
	No. 3.	£30 per annum.	1 year.		
SOCIETY OF APOTHECARIES OF LONDON	Gillson.	£20 per annum.	1 year.	Open to Licentiates of the Society, or to candidates for the Society's Diploma who obtain such Diploma within six months of their election to the scholarship.	Candidates must be under 35 years of age.
ST. BARTHOLOMEW'S MEDICAL SCHOOL	Entrance Scholarships. No. 1.	£75.	—	Open Competitive Examination in not more than three nor fewer than two of CHEMISTRY, PHYSICS, ZOOLOGY, BOTANY, PHYSIOLOGY, ANATOMY.	Full or University Course at St. Bartholomew's Hospital.
	,, No. 2	£75.	—		Ditto.
	,, No. 3	£150.	—	Open Competitive Examination in not fewer than three of the following:—CHEMISTRY, PHYSICS, BOTANY, ZOOLOGY, PHYSIOLOGY.	Full Course at St. Bartholomew's Hospital.
	Entrance Scholarship in Arts.	£100.	—	Open Competitive Examination in LATIN, MATHEMATICS, and GREEK, or FRENCH, or GERMAN.	Ditto.
	Jeaffreson Exhibition.	£50.	—	Open Competitive Examination in LATIN, MATHEMATICS, and GREEK, or FRENCH, or GERMAN.	Ditto.
	Shuter Scholarship.	£50.	—	Competitive Examination among Cambridge Graduates in ANATOMY and PHYSIOLOGY.	Ditto.
	Junior Scholarships. ,, No. 1.	£30.	—	Competitive Examination among Students in ANATOMY and BIOLOGY.	Study at St. Bartholomew's Hospital.
	,, No. 2.	£20.	—	Ditto.	Ditto.
	,, No. 3.	£25.	—	Competitive Examination in CHEMISTRY, PHYSICS, and HISTOLOGY.	Ditto.
	,, No. 4.	£15.	—	Ditto.	Ditto.
	Senior Scholarship.	£50.	—	Competitive Examination among Students in ANATOMY, PHYSIOLOGY, and CHEMISTRY.	Ditto.
	Kirkes Scholarship.	£30 and Medal.	—	Competitive Examination among Students in CLINICAL MEDICINE.	Ditto.
	Brackenbury Scholarships. ,, No. 1.	£39.	—	Competitive Examination among Students in MEDICINE.	Ditto.
	,, No. 2.	£39.	—	Competitive Examination among Students in SURGERY.	Ditto.
	Lawrence Scholarship.	£45 and Medal.	—	Competitive Examination among Students in SURGERY, MEDICINE, and MIDWIFERY.	Ditto.
	Sir Geo. Burrows Prize.	£10.	—	Competitive Examination in PATHOLOGY among Students.	Ditto.
	Skynner Prize.	13 guineas.	—	Competitive Examination in REGIONAL and MORBID ANATOMY among Students.	Ditto.
	Matthews Duncan Medal and Prize.	£20.	—	Competitive Examination among Students in MIDWIFERY and GYNÆCOLOGY.	Ditto.
	Luther Holden Research Scholarship in Surgery. (And other Prizes and Medals of less value.)	£105.	—	By Election.	Ditto.
CHARING CROSS HOSPITAL AND COLLEGE	Entrance Scholarships, open to students at the commencement of curriculum. Livingstone.	75 guineas.	—	All the Scholarships are awarded annually at the commencement of each Winter Session, after a competitive examination in the following groups of subjects:—(1) ENGLISH, including ENGLISH LANGUAGE and LITERATURE, ENGLISH HISTORY with alternative questions on the HISTORY OF THE BRITISH EMPIRE, and GEOGRAPHY, including elementary questions in PHYSICAL GEOGRAPHY; (2) LATIN and any one of the following three languages—GREEK, FRENCH, and GERMAN; (3) MATHEMATICS, including ARITHMETIC, ALGEBRA, and GEOMETRY; with MECHANICS, including STATICS and DYNAMICS; (4) INORGANIC CHEMISTRY, and any three of the following branches of EXPERIMENTAL PHYSICS—ACOUSTICS, HEAT, MAGNETISM, ELECTRICITY, and OPTICS; and (5) ANIMAL and VEGETABLE BIOLOGY. A Candidate may offer himself for examination in not more than three of the above groups of subjects, but group (1) must be one of the three.	Open to all general students.
	Huxley.	50 ,,	—		For sons of medical men.
	—	30 ,,	—		Open to all general students.
	—	20 ,,	—		Open to all general students.
	—	30 ,,	—		For dental students.

---

* In the M.B., B.S. examination a University Medal of value £5 may be awarded to the candidate who has passed with the greatest distinction. In each part of the M.D. and in the M.S. examinations a University Medal of value £25 may be awarded to the candidate who has passed with the greatest distinction.

Gynæcologist: Dr. J. H. Glenn. Pathologist and Radiologist: Dr. W. G. Harvey.

For further particulars apply to Mr. Seton Pringle, Hon. Sec., Medical Board, 27, Lower Baggot-street, Dublin.

Meath Hospital and County Dublin Infirmary.—Physicians: Sir John William Moore, Dr. James Craig, and Dr. Edward E. Lennon. Surgeons: Sir L. H. Ormsby, Mr. W. J. Hepburn, Mr. William Taylor, Mr. R. Lane-Joynt, and Mr. F. Conway Dwyer. Gynæcologist: Dr. F. W. Kidd. Clinical Assistants: Dr. William Boxwell and Dr. Henry Stokes. Pathologist: Professor Arthur H. White. This hospital was founded in 1753 and now contains 160 beds available for clinical teaching. A building containing 40 beds for the isolated treatment of fevers is attached to the Hospital. The certificates of this hospital are recognised by all the universities and licensing bodies of the United Kingdom. Six *Medical Clinical Clerks and Twelve Surgical Resident* Pupils and Dressers are appointed every six months, and a House Surgeon and two Clinical *Assistants* are elected annually. The session will open on Oct. 1st. A prospectus giving the complete arrangements for the Medical and Surgical classes for the coming session may be obtained from the Secretary of the Medical Board, Mr. William Taylor, 47, Fitzwilliam-square, Dublin.

Mater Misericordiæ Hospital, Dublin.[1]—Consulting Physician: Sir Francis R. Cruise. Consulting Surgeon: Mr. Charles Coppinger. Physicians: Sir Christopher Nixon, Bart., Dr. Joseph Redmond, Dr. John Murphy, and Dr. Martin Dempsey. Surgeons: Sir Arthur Chance, Mr. John Lentaigne, and Mr. Alexander Blaney. *Assistant Physician*: Dr. John O'Donnell. Assistant Surgeon: Mr. Curran. Temporary Assistant Surgeon: Mr. D. Farnan. Obstetric Physician: Dr. Robert Farnan. Ophthalmic Surgeon: Mr. Louis Werner. Surgeon for Diseases of Throat and Nose: Mr. Patrick Dempsey. Dental Surgeon: Mr. E. Sheridan. Pathologist: Dr. Edmond McWeeney. Anæsthetist and Surgical Registrar: Dr. Patrick O'Farrell. This hospital, the largest in Dublin, at present containing 345 beds, is open at all hours for the reception of accidents and urgent cases. Clinical instruction will be given by the Physicians and Surgeons at 9 A.M. daily. A course of Clinical Instruction on Fever will be given during the winter and summer sessions. A certificate of attendance upon this course, to meet the requirements of the licensing bodies, may be obtained. *Opportunities are afforded for* the study of Diseases of Women in the ward under the care of the Obstetric Physician, and at the Dispensary held on Tuesdays and Saturdays. Ophthalmic Surgery will be *taught in the* Special Wards *and in the* Dispensary. Surgical Operations will be performed on Mondays, Tuesdays, Fridays, and Saturdays at 11 o'clock. *Connected with* the hospital are extensive Dispensaries, which afford valuable *opportunities for the study of general Medical* and Surgical Diseases, and Accidents. Instruction will be given on Pathology and Bacteriology. Two House Physicians, six House Surgeons, and 16 resident pupils will be elected annually. Dressers and Clinical Clerks will also be appointed, and certificates will be given to those who perform their duties to the satisfaction of the staff. Leonard Prizes will be offered for competition annually. For further particulars see prospectus. Certificates of attendance upon this hospital are recognised by all the Universities and licensing bodies in the United Kingdom. Private Wards have been opened for the reception of Medical and Surgical cases. A Training School and a Home for Trained Nurses have been opened in connexion with the Hospital.

Terms of attendance.—Nine months, £12 12*s.*; six winter months, £8 8*s.*; three summer months, £5 5*s.* Entries can be made with any of the physicians or surgeons, or with the Registrar, Dr. Martin Dempsey, 35, Merrion-square. A prospectus containing in detail the arrangements for Clinical Instruction, Prizes &c., may be obtained from the Secretary, Medical Board.

Richmond, Whitworth, and Hardwicke Hospitals, *North Brunswick-street, Dublin.*—These hospitals contain 270 beds—86 for Surgical cases, 64 for Medical cases, and 120 for Fever and other epidemic Diseases. A Resident Physician and a Resident Surgeon are appointed each half year and are paid for heir services. 12 Resident Clinical Clerks are appointed each quarter and provided with furnished apartments, fuel, &c. These appointments are open not only to advanced Students, but also to those who are qualified in Medicine and Surgery. The Dressers are selected from among the best qualified of the pupils without the payment of any additional fee. For prospectuses apply to Sir W. Thomson, C.B., Hon. Treasurer, 54, Stephen's-green East; or to Dr. Travers Smith, Hon. Secretary, 20, Lower Fitzwilliam-street, Dublin.

Rotunda Hospital, Dublin.—This institution is the longest established gynæcological as well as maternity hospital in the British empire. Qualified men who take out a course of two or three months' duration during the autumn, winter, or spring periods obtain (if they show keenness and capacity) one or more forceps applications and a certain number of minor gynæcological operations. Unqualified students can also enter at any time for the practice of the hospital and have access, not alone to the maternity and gynæcological wards, but also to the pathological laboratory attached to the hospital. The residential quarters have undergone considerable improvement and afford comfortable accommodation. Valuable appointments are periodically filled by qualified students who have obtained the hospital diploma. Master: Dr. E. Hastings Tweedy. Assistants: Dr. J. W. Bell and Dr. G. B. McCaul. Pathologist: Dr. R. J. Rowlette. Resident Extern-Maternity Assistants: Dr. B. A. H. Solomons and Dr. J. R. Freeland. For further particulars apply to Dr. E. Hastings Tweedy, Master.

Royal Society of Medicine.—His Majesty the King has been graciously pleased "to accord his patronage to the Royal Society of Medicine, which has been formed by the amalgamation of the Royal Medical and Chirurgical Society with certain other medical societies." His Majesty has further intimated that on his return to town, in the autumn he will sign the roll of the society. We may add that within the last three months the society has gained two new sections, the Society of Anæsthetists and the Society for the Study of Disease in Children having decided to dissolve and to become joined to the society as sections for the study of these subjects.

Medical Education in London.—Messrs. Ash and Co., Southwark, have published an extremely valuable handbook under this title. The book is issued by the Conference of Deans of the Metropolitan Schools of Medicine as representing the Faculty of Medicine of the University of London, and was projected with the view to give visitors to the Franco-British Exhibition some idea of the vast field for medical education and research *existing in the metropolis. It is the work of* many writers, each a specialist in his particular branch, it is thoroughly well printed and well *illustrated*, and it can hardly fail to prove useful to members of the public who desire to enter the medical profession *or to* place their children in our profession. The book opens with a brief account of the City and the administrative *County* of London, its area and population, and the methods of local government. References are then made to the general hospitals to which medical schools are attached and to the various ancillary schools; and a few words are devoted to the distribution of the three great hospital funds, to the Poor-law infirmaries, and to the hospitals of the Metropolitan Asylums Board, so that the reader may get a general grasp of the medical and hygienic organisation of London. This is followed by a historical summary of the medical corporations and an account of the University of London and its Medical Faculty. The medical societies of London are described and the colleges and schools of the University of London in the Faculty of Medicine are treated in detail. Succeeding chapters are allotted to the Royal Army Medical College, the clinical facilities for the study of special branches of medicine, and the facilities for research and for *post-graduate study. An alphabetical list of the hospitals,* infirmaries, asylums, and dispensaries in London printed under *sub-headings is* appended and there is a good index.

THE NAVAL, MILITARY, AND INDIAN MEDICAL SERVICES.

THE conditions of service in the medical departments of the Navy, Army, and Indian Army, remain practically the same as for 1907. There is no new warrant or important modification of regulations calling for particular comment; and except to lay stress on the fact that the military services now offer a better opening to young medical men than they have ever done we do not propose to make any special reference to them. The terms of the warrants sufficiently explain their advantages.

With regard to the Naval Medical Service a few prefatory words are needed, for we have recently published articles dealing with the considerable amount of dissatisfaction which exists therein, while in summarising communications from our correspondents we came to the inevitable conclusion that some of the unfavourable criticism was just. We would strongly urge on the authorities the advisability of removing legitimate grievances *now;* the reforms could for the most part be effected at the expense of little but tact and a consideration of what is justly due to the naval medical officers. Every naval medical officer who has written to our columns, and this is not a small number, has expressed dissatisfaction with the position in which the cabin question has been left by recent regulations. Allotment to the medical officer of cabin accommodation inferior to that to which he is entitled still takes place, and cannot, at any rate cannot always, be explained by the cramped space on that elaborate box of tricks, a modern man-of-war. Another innovation sadly wanted is a regulation to insure that the senior medical officers in hospitals should have proper disciplinary power over their subordinates and patients. Other points, the supply and use of boats, for example, and the payment in certain grades, might well be settled in accordance with the just desires of the Naval Medical Service, for the Admiralty will be prudent to aim at making the Service more popular. And the same may be said of all three services. For that there is now no competition for commissions in the Naval Medical Service and no keen competition for those in the Army Medical Staff or the Indian Medical Staff seems undeniable, and this is the more unfortunate a position that fewer men are now entering the medical profession as a whole. It is no longer easy for all hospitals to obtain suitable residents, while assistants are scarce and even junior partners are not to be found directly they are wanted. The Services will therefore have to be careful to increase their popularity, and the point is that it may be economical of them to do so now. By small concessions they may be avoiding having later to pay a heavy price to attract men. We would also suggest that it is unwise to let any of these departments run below the normal strength if it is possible to maintain them at par.

An esteemed and shrewd correspondent who has seen many years' service in the Naval Medical Service has sent us a letter on the merits and demerits of the Service, the information in which will be interesting to some of our readers. We regret that limitations of space have prevented us from publishing the communication at length, but we are happy to give its substance as it shows that, though reform may be wanted in the Service, its present state is not without material advantages. At one time not so very long ago, he says, the Naval Medical Service was not looked upon as one in which an educated gentleman could serve with dignity, while complaints were heard of many of the conditions of service. But the old order of things is giving place to the new, and our correspondent, after comparing the lot of the naval medical officer with that of the civil practitioner, comes to the conclusion that the trials of the civil branch of the profession are greater than those of the naval branch, and that probably when all things are considered the naval surgeon is in a far better position than the average lay professional man. In the junior ranks of the Service, he says, the pay is better than the average income of the lay medical man of the same age, and promotion is not always slow. "With £20 a month the young naval surgeon can, if he is not extravagant, get along very comfortably, though he will require at the commencement of his career £100 for outfit. A private income is certainly not necessary though it is eminently desirable. After 20 years of service a naval surgeon is entitled to a pension of £350 a year, which compares very favourably with the prospects of many medical men on the civil side of the profession, and in case of illness there is the half-pay rate, while pensions are provided for widows and children should a married officer die in action or from injuries received while in discharge of his duties." He points out that in this way the young naval officer is relieved of the most serious anxiety which can press upon a married man, but he suggests that he ought not to marry young without due consideration, a warning which, however, applies to most medical men. In comparing the Medical Services of the Army and Indian Army with that of the Navy he says, "though the Army and Indian Service are better paid, expenses are higher and the work more fatiguing, while in the Indian Service there is a greater liability to disease and death." With regard to the position of the young surgeon on board his vessel our correspondent thinks he gets a better chance in the Navy than in the Army. "So long as the new surgeon is moderately good at his profession, is kind and unselfish towards his patients, is not too self-assertive, and has any positive accomplishments or skill at any sport or game, he should get on very well, especially if he is good-humoured and helpful. And if a man has not these qualities and readiness where should he be advised to practise?"

ROYAL NAVY MEDICAL SERVICE.

REGULATIONS FOR THE ENTRY OF CANDIDATES FOR COMMISSIONS IN THE MEDICAL DEPARTMENT OF THE ROYAL NAVY.

Every candidate for admission into the Medical Department of the Royal Navy must be not under 21 nor over 28 years of age on the day of the commencement of the competitive examination. He must produce an extract from the register of the date of his birth; or, in default, a declaration made before a magistrate, from one of his parents or other near relative, stating the date of birth. He must also produce a certificate of moral character, up to date, and a recommendation signed by a clergyman or magistrate, to whom he has been for some years personally known, or by the president or senior professor of the college at which he was educated.

He must be registered under the Medical Act in force, as qualified to practise medicine and surgery in Great Britain and Ireland.

He must declare (1) his age and date and place of birth; (2) that he is of pure European descent and the son either of natural-born British subjects or of parents naturalised in the United Kingdom; (3) that he labours under no mental or constitutional disease or weakness, nor any other imperfection or disability which may interfere with the most efficient discharge of the duties of a medical officer in any climate; (4) that he is ready to engage for general service at home or abroad, as required; (5) whether he holds, or has held, any commission or appointment in the public services; and (6) that he is registered under the Medical Act in force as duly qualified professionally, and what diplomas, &c., he holds.[1]

He must be free from organic or other diseases, and his physical fitness will be determined by a Board of Medical Officers, who are to

which will

e admission of candidates will be

marks gained in the compulsory

qualify in voluntary subjects will have the marks so obtained added to those gained in the compulsory subjects, and their position on the list will be determined by the total of marks for both compulsory and voluntary subjects.

Candidates will be examined by the Examining Board in the following compulsory subjects and the highest number of marks attainable will be distributed as follows (a fee of £1 will have to be paid by each candidate to entitle him to take part in the competition): (*a*) medicine, materia medica, therapeutics and general hygiene, 1200 marks; (*b*) surgery and surgical anatomy, 1200 marks. The examination in medicine and surgery will be in part practical and will include, beyond papers, the examination of patients, the examination of pathological specimens, a knowledge of bacteriology, the performance of operations on the dead body, and the application of surgical apparatus. The attention of candidates is especially drawn to the importance of

Sciences: chemistry (300); physiol

(300); and geology and physical geo

be allowed to present himself for examination in more than two of *these subjects.* French and German (300 each), 600 marks. A number less than one-third of the marks obtainable in each of these *voluntary subjects* will not be allowed to count in favour of the candidate who has qualified in the *compulsory subjects.* The knowledge of modern languages being considered of great importance, all intending competitors are urged *to qualify in French and German.* The examination in chemistry will include the general principles of inorganic and organic chemistry; the preparation and properties of the chief non metallic and metallic elements and their compounds; the preparation, properties and classification of the more important compounds, such as marsh gas, ethylene, acetylene, methyl and ethyl alcohols, glycerin, ether, formic, acetic, lactic and oxalic acids; cyanogen and cyanides, carbohydrates; fats, proteids. The examination in physiology will comprise the minute structure and functions of the various tissues and organs of the body; the physiology of the blood; the nature of food and the processes of its digestion; the mechanics of the circulation and of respiration; the physiology of nutrition, secretion, and excretion; animal heat, the nature of sensation, volition, reflex action, inhibition and influence of the nervous system on other organs and their functions. The examination in zoology will include—the general principles of biology, and a comparison of animals with plants; the distinctive characters of the larger groups of animals—the protozoa, cœlenterata, vermes, arthropoda, mollusca, echinodermata, and vertebrata—as illustrated by common types; the elements of embryology; animal parasites. The examination in botany will comprise the general principles of the morphology and physiology of low forms of life—e.g., torula, bacteria, spirogyra, moss fern; the general morphology of flowering plants; diagnosis of the important British natural orders; medicinal plants. The examination in geology and physical geography will be limited to general principles, such as the relations of the earth to the rest of the solar system, nature of the earth's crust and the chief kinds of rocks, general configuration of land and water, mountains, plains, islands, rivers, lakes, glaciers and icebergs, ocean currents, tides, winds, storms, dew, rain, climate, volcanoes, earthquakes, distribution of animal and vegetable life.

---

[1] If any doubt should arise on this question the burden of clear proof that he is qualified will rest upon the candidate himself.

The appointments announced for competition will be filled from the list of qualified candidates, arranged in order of merit; but should it at any time be considered expedient to grant Commissions beyond those periodically competed for, the Admiralty have power to admit annually (a) two candidates—proposed by the governing bodies of schools of medicine in the United Kingdom—who have satisfactorily filled the office of house surgeon in a large civil hospital for at least six months; and (b) not more than six candidates, according to requirements, specially recommended by the governing bodies of such colonial universities as may be selected and whose qualifications are recognised by the General Medical Council. Candidates so proposed are to be approved by the Director-General of the Medical Department of the Navy and are to be certified by the governing body proposing them as duly qualified according to the regulations in force for the entry of candidates. In cases of colonial nominations, registration of professional qualifications may be deferred until after the arrival in England of a candidate who has been passed on the station, but a Commission as Surgeon will not be granted until the certificate of the Registrar of the Medical Council has been produced at the Medical Department of the Navy. Candidates from schools at home will be required to pass a physical examination in London which will be arranged for by the Medical Director-General. Colonial candidates will have to pass a physical and test examination before a board of Naval Medical Officers on the station. Successful candidates immediately after passing the examination in London will receive commissions as Surgeons in the Royal Navy, and will undergo a course of practical instruction in Naval Hygiene, &c., at Haslar Hospital. Three prizes of the approximate value of £10 each will be awarded at the close of each session at Haslar to the students who have shown the greatest proficiency.

Surgeons on entry are only required to provide themselves with a pocket case of instruments, a stethoscope, and three clinical thermometers. All other instruments are provided at the public expense.

Promotion.

An Inspector General of Hospitals and Fleets will be selected from amongst Deputy Inspectors-General who have in that rank three years' full pay service and who have not at any time declined foreign service except for reasons which the Lords Commissioners of the Admiralty regard as good and sufficient.

A Deputy Inspector-General of Hospitals and Fleets will be selected for ability and merit from amongst Fleet Surgeons.

(a) Subject to the approval of the Lords Commissioners of the Admiralty rank as Fleet Surgeon will be granted to Staff Surgeons at the expiration of eight years from the date of promotion to Staff Surgeon, provided they are recommended by the Medical Director-General and have not declined service except for reasons which in the opinion of the Lords Commissioners of the Admiralty are satisfactory. (b) Special promotions from the rank of Staff Surgeon to that of Fleet Surgeon will be made at their Lordships' discretion in cases of distinguished service or conspicuous professional merit. Such promotions will be exceptional and will not exceed the rate of one in two years; the total number at any one time of Fleet Surgeons holding that rank by such special promotions will not exceed six.

(a) Rank as Staff Surgeon will be granted, subject to their Lordships' approval, to surgeons at the expiration of eight years from the date of entry, provided they are recommended by the Medical Director-General, and have passed such examination as may be required after completion of five years from the date of entry in the rank of surgeon. (b) Special promotions will be made at their Lordships' discretion to the rank of Staff Surgeon in cases of distinguished service or conspicuous professional merit. Such promotions will be exceptional and not exceed the rate of one a year. The total number at any one time of Staff Surgeons holding that rank by such special promotions will not exceed eight. No officer will be so promoted unless he passes the examination prescribed for other surgeons, but in such a case the requirement of five years' time in rank of surgeon will be dispensed with. (c) When a surgeon's promotion to the rank of Staff Surgeon has been retarded by failure to pass the qualifying examination he will, should he pass and be promoted, be dealt with as follows. He will be granted the seniority as Staff Surgeon he would have received had he passed in ordinary course. He will reckon service for increase of full and half pay only from the date of appointment to full pay as Staff Surgeon. If on half pay, or if placed on half pay when promoted, he will receive the lowest rate of half pay of the new rank from the date of passing the qualifying examination. Where delay in passing the qualifying examination may be due to unavoidable circumstances special consideration will be given. (d) The seniority of surgeons on entry will be determined by the sum total of the marks they obtain at the London examination and those at the conclusion of the Haslar course and their names will then be placed in the official navy list, except in the case of candidates who hold, or are about to hold, a post as resident medical officer or surgical officer to a recognised civil hospital. These candidates will retain the position in the list which they obtained on entry, and when their period of service as resident officer is over they will join the next Haslar course and will be required to obtain qualifying marks. Surgeons entered without competition will take seniority next after the last surgeon entered at the same time by competition. (e) The examination for promotion to the rank of staff surgeon will be held by the Examining Board, to which a naval medical officer will be attached to conduct the examination in naval hygiene. The subjects of examination will be in writing and will include medicine, surgery, pathology, general hygiene, naval hygiene. Earlier promotion to the rank of staff surgeon may be granted to those surgeons who, before entry, have held the post of legally qualified resident medical or surgical officer to a civil hospital of not less than 100 beds for a period of not less than six months, provided their conduct and professional abilities have been favourably reported on during the time they have served in the Navy. They may be granted from six months to one year's seniority, according to the time they have held their civil appointments, but in no case will more than one year's seniority be granted. This only applies to officers who enter by competition (Para. 4 (f)). A candidate who at the time of passing the examination for entry into the medical branch of the Royal Navy holds, or is about to hold, an appointment as resident medical or surgical officer in a recognised civil hospital, may be allowed to serve in such civil appointment provided that the period of such service after the date of entry into the Royal Navy does not exceed *one year*. Pay from naval funds will be withheld from officers while thus serving, but the time concerned will reckon for increase of full and half pay while on the active list, and retired pay or gratuity on retirement or withdrawal, except that no officer will be allowed to retire on a gratuity until he has completed four years' service exclusive of the time spent as resident medical or surgical officer. The eligibility of this appointment will also be decided by the Medical Director-General.

Staff Surgeons of under 4 years' seniority and Surgeons...	39	103*

* Except at Malta, where the allowance will be £70, but servants will be provided at the public expense. These allowances are also granted to medical officers of marine divisions and dockyards.

An allowance of 5s. a day, in addition to full pay, is granted to the senior medical officer, being a Fleet or Staff Surgeon, of a flag ship bearing the flag of a Commander-in-Chief. An allowance of 2s. 6d. a day is granted to the senior medical officer, being a Fleet or Staff Surgeon, of the ship bearing other flags or broad pendants. The following charge allowances may be granted to medical officers in charge of hospital ships: if above the rank of fleet surgeon, 5s. a day; and if of the rank of fleet surgeon or junior, 2s. 6d. a day. The Fleet and Staff Surgeons serving in the Admiralty and the Marine Rendezvous will be granted the Hospital allowance of £55 a year in addition to the usual lodging money. Medical officers conducting the course of instruction at Haslar Hospital will receive the following allowances: two senior officers employed upon this duty, £150 a year each, the junior officer assisting, £50 a year, and the junior officer instructing the Sick Berth Staff, £20 a year. The junior officer instructing the Sick Berth Staff at Plymouth, £50 a year. Medical officers employed elsewhere than at a hospital, and not victualled in kind, receive an allowance of 1s. 6d. a day in lieu of provisions, fuel, and lights. The travelling allowances, extra pay, lodging money, and compensation for losses are fixed for naval medical officers according to their relative rank in the service.

Candidates will do well to notice that the regulations issued to applicants do not put any limit on the amount of half pay service which they may be compelled to undergo.

Retirement.

Compulsory retirement will be as follows —

Inspector and Deputy Inspector-General of Hospitals and Fleets.	At the age of 60, or at any age, if he has had three years' non-employment in any one rank, or after four years' continuous non employment in any two ranks combined. Except that if in any particular case the Lords Commissioners of the Admiralty may consider that the interests of the public service will be materially advanced by the further retention of an Inspector-General of Hospitals and Fleets on the active list, the age for the retirement of such Inspector-General may be extended to 62.	To be retired irrespective of age if found physically unfit for service.
Fleet Surgeon, Staff Surgeon, and Surgeon.	At the age of 55 or at any age, if he has had three years' non employment in any one rank, or after four years continuous non employment in any two ranks combined	

The special attention of candidates is directed to the following rules under which officers are allowed to withdraw from the service after four years' full pay service in the Royal Navy, with the advantage of joining the Reserve of Naval Medical Officers —

After four years' service in the Royal Navy, an officer, if he wishes,
f Naval Medical Officers,
passing into the Reserve
y List, he will retain his
naval rank and be entitled to wear his naval uniform under the regulations applying to officers on the retired and reserved lists of His Majesty's Navy

(3) If he agree to remain in the Reserve for four years he will receive a retaining fee of £25 per annum. If at the expiration of this period he agree to remain in the Reserve for a further period of four years he will continue to receive the same retaining fee

Should an officer prefer it, howeve
for a period not exceeding eight ye
notice of his intention to resign his
he will receive no retaining fee)
Reserve service after the expiration of four years served under the conditions referred to in (3), by renouncing his retaining fee for his last four years' service in the Reserve

No officer will be allowed to remain in the Reserve for a longer period than eight years

Officers of the Reserve will be liable to serve in the Royal Navy in time of war or emergency When called up for such service they will receive the rate of pay—viz, 17s a day and allowances—to which they

a most unjust one.

in the following: (1) the medical and surgical practice of the hospital, including instruction in anæsthetics; (2) a course of operative surgery on the dead body; (3) a course of bacteriology; (4) a course of ophthalmic surgery, particular attention being paid to the diagnosis of errors of refraction; and (5) a practical course of skiagraphy. Relative rank is accorded to medical officers as laid down in the King's Regulations and Admiralty Instructions.

The Admiralty has made a considerable effort to make the Medical Service attractive to men of a good professional stamp. The new regulations promulgated on Oct. 31st, 1903, are of course included in the above account of the Naval Medical Service. By these regulations promotion was accelerated, special promotion in the lower grades was made possible in cases of distinguished service or conspicuous professional merit, and encouragement to enter the service, in the shape of earlier promotion, was given to men who have held resident posts in recognised hospitals. A feature of the latest regulations is the permission to withdraw at the end of four years with a gratuity of £500. The pay has been increased but, in respect of allowances, the medical officers of the navy, up to the senior ranks, are not as well off as those of the Royal Army Medical Corps. In spite of the steps taken by the Admiralty there is still much discontent among naval medical officers, and such discontent will exist until the medical officers are unhampered in the performance of their important work by the executive officers. The medical officers should have control over the sick bay staff in ships, and over nurses and other attendants in hospitals, and executive officers should no longer figure as presidents of "medical surveys." The authority of the Director-General must be made adequate. More care must also be taken that medical officers are assigned fitting cabin accommodation. To make the service thoroughly efficient the medical officers must be given authority and position commensurate with their responsibilities.

THE ARMY.

Consequent upon the issue of the Royal Warrant published in Army Orders dated July 1st, 1898, the Army Medical Staff and the Medical Staff Corps were formed into the Royal Army Medical Corps. Medical officers also have been placed. as regards sick leave of absence on full pay, on the same footing as that laid down for regimental officers. By a Royal Warrant dated Nov. 10th, 1891, Art. 1208*b* of the Pay Warrant was revised by inserting the words "an officer of our Royal Army Medical Corps" after the words "combatant officer," thus giving medical officers an equal title with combatant officers to reckon time on half-pay towards retirement when the half-pay has been due to ill health contracted in the performance of military duty. Under the Royal Warrant of July, 1895, time on half-pay not exceeding a year may in similar circumstances also reckon towards promotion. In the New Royal Warrant it was announced that the late Queen had been pleased to approve of the following ranks for the officers of the Royal Army Medical Corps: Colonel, Lieutenant-Colonel, Major, Captain, and Lieutenant. The Warrant also states that the Medical Staff of the Army shall in future consist of Surgeon-Generals (ranking as Major-Generals). Officers of the Royal Army Medical Corps holding appointments in the Household Troops are to be borne as seconded officers on the establishment of the Royal Army Medical Corps.

REGULATIONS FOR ADMISSION TO THE ROYAL ARMY MEDICAL CORPS (PROMULGATED BY ARMY ORDERS DATED MAY 1ST, 1902).

A candidate for a commission in the Royal Army Medical Corps must be 21 years and not over 28 years of age at the date of the commencement of the entrance examination. He must, at the time of his appointment, be registered under the Medical Acts in force in the United Kingdom. A candidate must complete the subjoined form of application and declaration and submit it to the Director-General, A.M.S., in sufficient time to permit of reference to the medical school in which the candidate completed his course as a medical student.

*Application of a Candidate for a Commission in the Royal Army Medical Corps.**

1. Name in full... ... ...
2. Address ... ...
3. Date of birth † ... ...
4. Qualifications ... ...
5. Academic and other distinctions ... ...
6 Name of the Dean or other responsible authority of the school in which the candidate completed his course as a medical student ... ...
7. Particulars of any commission or appointment held in the public services ... ...
8. Date of examination at which the candidate proposes to present himself ... ...

Declaration.

(N.B.—A mis-statement by the candidate will invalidate any subsequent appointment and cause forfeiture of all privileges for services rendered.)

I hereby declare upon my honour that the above statements are true to the best of my knowledge and belief and further:—

1. That I am a British subject of unmixed European blood.

2. That I am not, as far as I know, at present suffering from any mental or bodily infirmity, or physical imperfection or disability that is likely to preclude me from efficiently discharging the duties of an officer in any climate.

3. That I will fully reveal to the Medical Board, when physically examined, all circumstances within my knowledge that concern my health.

I also declare that my vision is good with either eye (with or without the aid of glasses as the case may be).

Signature ....
Date..

---

* All communications to be addressed to the Secretary, War Office, Whitehall, S.W.

† A certificate of registration of birth or other satisfactory evidence of age, such as a declaration made before a magistrate by one of his parents or guardians, giving the date of his birth, to be furnished.

The dean of the candidate's school will be requested by the Director-General to render a confidential report as to his character, conduct, professional ability, and fitness to hold a commission in the corps. A candidate whose application is regarded as satisfactory will be directed to appear before the Director-General, Army Medical Service, a few days (usually on the fourth Thursday of the month) preceding the examination. The Director-General will decide if the candidate may be allowed to compete for a commission. If approved, he will then be examined as to his physical fitness by a board of medical officers. The following is the order of the examinations:—

1. A candidate for a commission in the Royal Army Medical Corps must be in good mental and bodily health and free from any physical defect likely to interfere with the efficient performance of military duty.

2. The attention of the board will be directed to the following points: (*a*) That the correlation of age, height, weight, and chest girth is equal or superior to that which is given in the following table:—

Physical Equivalents.

Age.	Height without shoes.	Chest.	
		Girth when expanded.	Range of expansion.
	Inches.		
21 and upwards.	62½ and under 65	35 inches.	2 inches.
	65 " 68	35½ "	2 "
	68 " 70	36 "	2 "
	70 " 72	36½ "	2½ "
	72 and upwards.	37 "	2½ "

(*b*) Measurement of height. The candidate will be placed against the standard with his feet together and the weight thrown on the heels and not on the toes or outside of the feet. He will stand erect without rigidity and with the heels, calves, buttocks, and shoulders touching the standard; the chin will be depressed to bring the vertex of the head level under the horizontal bar and the height will be noted in parts of an inch to eighths.

(*c*) Measurement of chest. The candidate will be made to stand erect with his feet together and to raise his hands above his head. The tape will be carefully adjusted round the chest with its posterior upper edge touching the inferior angles of the shoulder blades and its anterior lower edge the upper part of the nipples. The arms will then be lowered to hang loosely by the side and care will be taken that the shoulders are not thrown upwards or backwards so as to displace the tape.

(*d*) Weight. The candidate will also be weighed and his weight recorded in the proceedings of the Board.

The regulations regarding the examination of eyesight are as follows:—

1. If a candidate can read D.=6 at 6 metres (20 English feet) and D.=0·6 at any distance selected by himself, with each eye without glasses, he will be considered *fit*.

2. If a candidate can only read D.=24 at 6 metres (20 English feet) with each eye without glasses, his visual deficiency being due to faulty refraction which can be corrected by glasses which enable him to read D.=6 at 6 metres (20 English feet) with one eye, and D.=12, at the same distance with the other eye, and can also read D.=0·8 with each eye without glasses, at any distance selected by himself, he will be considered *fit*.

3. If a candidate can read D.=6 at 6 metres (20 English feet) with one eye, a higher defect than D.=24 will be accepted in the other; and if he can read D=36 with the defective eye at the required distance, the defect being due to error in refraction which can be remedied by glasses so that he can read, at least, D.=12, he will be considered *fit*.

4. If a candidate cannot read D.=24 at 6 metres (20 English feet) with each eye without glasses, notwithstanding he can read D.=0·8, he will be considered unfit. The candidate must be able to read the tests without hesitation in ordinary daylight. (N.B.—Snellen's test types will be used for determining the acuteness of vision.) Squint, or any morbid conditions, subject to the risk of aggravation or recur
in either eye, will cause the rejection of a candidate. (1)
distinguish the principal colours will not be regard
rejection, but the fact will be noted in the report,
date will be informed. (2) The degree of acuteness

Half Pay.

Rank.	Daily.	Yearly.
urgeon—	£ s. d.	£ s d
Under 2 years' full pay service	0 6 0	109 10 0
After 2 years' full pay service	0 7 0	127 15 0

" 4 " "	1 9 0	529 5 0
Inspector-General	1 18 0	693 10 0

Candidates will do well to notice that the regulations issued to applicants do not put any limit on the amount of half pay service which they may be compelled to undergo

Retirement.

Compulsory retirement will be as follows —

Inspector and Deputy Inspector-General of Hospitals and Fleets	At the age of 60, or at any age, if he has had three years' non-employment in any one rank, or after four years' continuous non-employment in any two ranks combined. Except that if in any particular case the Lords Commissioners of the Admiralty may consider that the interests of the public service will be materially advanced by the further retention of an Inspector General of Hospitals and Fleets on the active list, the age for the retirement of such Inspector General may be extended to 62.	To be retired irrespective of age if found physically unfit for service.
Fleet Surgeon, Staff Surgeon, and Surgeon.	At the age of 55 or at any age, if he has had three years' non-employment in any one rank, or after four years' continuous non employment in any two ranks combined	

The special attention of candidates is directed to the following rules under which officers are allowed to withdraw from the service after four years' full pay service in the Royal Navy, with the advantage of joining the Reserve of Naval Medical Officers —

After four years' service in the Royal Navy, an officer, if he wishes, may [illegible] f Naval Medical Officers, when [illegible] —

(1) [illegible] passing into the Reserve

(2) [illegible] y List, he will retain his naval rank and be entitled to wear his naval uniform under the regulations applying to officers on the retired and reserved lists of His Majesty's Navy.

(3) If he agree to remain in the Reserve for four years he will receive a retaining fee of £25 per annum If at the expiration of this period he agree to remain in the Reserve for a further period of four years he will continue to receive the same retaining fee

Should an officer prefer it, however, he may simply enter the Reserve for a period not exceeding eight years, with power to give six months' notice of his intention to resign his position at any time (in which case he will receive no retaining fee) He may also adopt this method of Reserve service after the expiration of four years served under the conditions referred to in (3), by renouncing his retaining fee for his last four years' service in the Reserve

No officer will be allowed to remain in the Reserve for a longer period than eight years

Officers of the Reserve will be liable to serve in the Royal Navy in time of war or emergency When called up for such service they will receive the rate of pay—viz, 17*s* [illegible] they would have been entitled after four [illegible]

Voluntary retirement and with [illegible] lows (*a*) Every officer will have the [illegible] hips' approval, of retiring after 20 years' full pay service on the scale of retired pay provided in Paragraph 16 or with a gratuity on the scale provided in that paragra [illegible] eight 12 [illegible]

16 The name of an officer [illegible] will then be severed, except in of the Navy, with which all connexion the case of officers who withdraw after four years who are liable to serve in the Reserve (*c*) Voluntary retirement and withdrawal at the discretion of their Lordships will be allowed, as a rule, only when an officer is unemployed or serving at home Under very special circumstances, however, it may be permitted in the case of an officer serving abroad, provided he pays his passage home, and, if necessary, that of his successor (*d*) Applications from officers to retire or withdraw or resign their commissions will receive every consideration, but no officer will, as a rule, be permitted to resign under three years from the date of entry.* In order that arrangements may, as far as possible, be made for the relief of officers who may wish to withdraw on a gratuity it is desirable that six months' notice of their wish should be forwarded for the consideration of their lordships

* The Admiralty reserve to themselves power to remove any officer from the list for misconduct

Gratuities and retired pay will be awarded on retirement and withdrawal on the under mentioned scale (Paragraph 16) —

Rank.	Gratuities	Daily.	Yearly.
Surgeon, Staff Surgeon, and Fleet Surgeon—	£ s d	£ s. d	£ s d
After 4 years' full-pay service	500 0 0	—	—
After 8 years' full-pay service (including service allowed by Para 4 (*f*)) ...	1000 0 0	—	—
After 12 years' full pay service (including service allowed by Para 4 (*f*))	1500 0 0	—	—
After 16 years' full pay service (including service allowed by Para 4 (*f*)) ..	2250 0 0	—	—
Fleet Surgeon—			
After 20 years' service (including proportion of half-pay time)	—	*1 0 0	365 0 0
After 24 years' service (in- [illegible]	—	*1 2	410 12 6
[illegible] cluding proportion of half pay time)	—	*1 5 0	456 5 0
After 30 years' service (including proportion of half-pay time)	—	*1 10 0	547 10 0
Deputy Inspector General ...	—	1 15 0	638 15 0
Inspector-General	—	2 0 0	730 0 0

* To obtain this rate an officer must hold the commission of Fleet Surgeon.

An officer retired with less than 20 years' service on account of disability, contracted in and attributable to the Service, will receive the half pay of his rank, or, with the consent of their Lordships, a gratuity on the scales given in Paragraphs 16 and 18 (*b*), but such officer will not be entitled to receive any special compensation for the disability in addition to the gratuity as above (Paragraph 17) [2]

An officer retired with less than 20 years' service on account of disability, contracted in but not attributable to the Service, will receive—(*a*) if he has over eight years full-pay service, either a gratuity on the scale given in Paragraph 16 or half pay according as their Lordships think fit, (*b*) if he has less than eight years' full pay service, such gratuity as their Lordships think fit, not exceeding the rate of £125 for each year of full pay service (Paragraph 18) In circumstances other than those specified in Paragraphs 17 and 18, and other than misconduct, neglect of duty, &c., an officer retired with less than 20 years' service will not be allowed half pay or retired pay, but will receive a gratuity on the scale laid down in Paragraph 16 if he has eight years' full pay service, and on that provided in Paragraph 18 (*b*) should his full pay service not amount to eight years The power vested in their Lordships of granting reduced rates of half pay and retired pay in cases of misconduct is extended to the award of gratuities on retirement, and the gratuity awarded will be reduced to such an amount as is thought fit An officer retiring after 20 years' full pay service will be eligible, if recommended by the Medical Director General for distinguished or meritorious service, to receive a step of honorary rank, such step to be awarded at their Lordships' discretion, and not to confer any claim to increase of retired pay or of widow's pension. All retired officers will be liable, till the age of 55, to serve in time of declared national emergency, in a rank not lower than that held on retirement This liability does not exist in cases of officers who withdraw from the Naval Service receiving a gratuity after 8, 12, or 16 years' full pay service Retired officers will receive special consideration as regards appointments on shore connected with the Admiralty now filled by civilians

Widow's Pension

When an officer retires or withdraws *on a gratuity* his widow and children will have no claim to pension or compassionate allowance Officers servi [illegible] are injured on duty, or lo [illegible] , or under the san [illegible] -en, pensions and [illegible] as officers of the same rank on the permanent Active List

Miscellaneous.

A special cabin will be appropriated to the Fleet or Staff Surgeon or the Surgeon in charge of the medical duties in each ship Special regulations have been made as regards the mess expenses of medical officers appointed to the several divisions of Royal Marines for limited periods Every medical officer will be required to undergo a post- [illegible] s' duration at a Metropolitan Hospital [illegible] the exigencies of the Service permit), [illegible] ng his Surgeon's, Staff Surgeon's, and Fleet Surgeon's peri [illegible] this course the medical officer will b [illegible] pay and will be granted lodging and [illegible] expenses as for service under the Re [illegible] r port, the fees for each course (not exceeding £25) will be paid by the Admiralty on the production of vouchers at the end of the course The medical officer will be required to produce separate certificates of efficient attendance district in which the officer is serving. The subjects of this examination, which are detailed in the King's Regulations, are as follows: (1) squad, company, and corps drills and exercises; (2) the duties of wardmasters and stewards in military hospitals, and the preparation of returns, accounts, and requisitions connected therewith; (3) duties of executive medical officers; and (4) military law.

---

[2] If the health of a surgeon breaks down before he completes 20 years' service, even if his disability be contracted in the Service or be due to climatic causes, he is liable at once to be placed on the retired list, receiving only a gratuity. This point should be well noted, as it is a most unjust one.

Captains before Promotion to Major.—(For Captains promoted to that rank after July 27th, 1895.) Captains will be examined under the rules laid down in Paragraph 23 and will be eligible for acceleration in their promotion to the rank of Major under Article 352 of the Pay Warrant.

A Captain promoted to that rank in January, 1893, can gain the full acceleration. In all cases an officer who gains accelerated promotion will be placed for precedence after the last officer (whether subject to acceleration or not) promoted approximately 3, 6, 12, or 18 months before him.

This examination, which may be taken at any time after completing five years' service, will be held on the termination of a period of special study at such times and under such arrangements as the Director-General A.M.S. may determine. The examination will consist of written papers, essays, oral and practical examinations in the following subjects, which are detailed in the King's Regulations: (1) medicine; (2) surgery; (3) hygiene; (4) bacteriology and tropical disease; and (5) one special subject from the subjoined list to which additions may from time to time be mad [illegible] tropical diseases; (b) dental surgery; (c) [illegible] venereal diseases; (d) midwifery and gyn [illegible] surgery, advanced; (f) [illegible], including laryngology and rhinology; [illegible] ne; and (i) State medicine. Captains ser [illegible] 27th, 1895, will be promoted under the [illegible] in Appendix I., Regulations for Army [illegible] not be eligible for acceleration.

Majors before Promotion to Lieutenant-Colonel (for Majors promoted to the rank after March 31st, 1895).—This examination, which may be taken at any time after three years in the rank of Major, will be held in the military district in which the officer is serving at times which will be duly notified. The subjects of this examination, which are detailed in the King's Regulations, are as follows: 1. Military law. 2. Army medical organisation in peace and war. 3. Sanitation of towns, camps, transports, and all places likely *to be occupied by troops* in peace and war; epidemiology, and the management of epidemics. 4. (*a*) Medical history of the more important campaigns and the lessons to be learnt therefrom; (*b*) a knowledge of the Army Medical Services of the more important Powers; and (*c*) the laws and customs of war, so far as they relate to the sick and wounded.

PAY.

The following shall be the rates of pay, additional pay, and charge pay of the Army Medical Staff and Royal Army Medical Corps:—

Army Medical Service.	Inclusive of all allowances except field and travelling allowances (yearly).
At Headquarters.	£
Director-General	2000
Deputy Director-General	1500
Assistant Director-General...	850
Deputy Assistant Director-General	750
	Exclusive of allowances (daily).
At Other Stations.	£ s. d.
Surgeon-General	3 0 0
Colonel	2 5 0
Lieutenant-Colonel	1 10 0
Lieutenant-Colonel promoted to the rank on or after Jan. 9th, 1907, after three years as such	1 15 0
Major	1 3 6
After three years as such...	1 6 0
Captain	0 15 6
After seven years' total full-pay service	0 17 0
After ten years' total full pay service	1 1 0
Lieutenant on probation and Lieutenant	0 14 0
Adjutant of the Royal Army Medical Corps (Volunteers)	The pay of his rank.

A Captain of the Royal Army Medical Corps, holding the brevet rank of Major, shall receive pay at 2*s.* a day, in addition to the rates laid down.

Additional Pay.

An officer not serving on the Headquarters Staff appointed a member of the Advisory Board, £150 a year. An officer serving as secretary of the Advisory Board and Nursing Board, £100 a year. An officer under the rank of Lieutenant-Colonel holding an appointment as specialist, 2*s.* 6*d.* daily.

Charge Pay.

(*a*) An officer in charge of a general or other hospital, or of a division of a general hospital—

	Daily. s. d.
If in charge of at least 50 beds	2 6
,, ,, 100 ,, ...	5 0
,, ,, 200 ,, ...	7 6
,, ,, 300 ,, ...	10 0
(*b*) Senior medical officer, Royal Arsenal, not exceeding	10 0
(*c*) Officer in command of the Depôt, Royal Army Medical Corps	5 0
(*d*) The Senior officer of the Army Medical Service with an army in the field— A rate to be fixed by the Secretary of State, according to the magnitude of the charge.	
(*e*) In a command abroad— The senior medical officer, if under the substantive rank of colonel, if the number of soldiers is 1500 or upwards	Daily. 5 0

Extra-duty Pay.

An officer of the Royal Army Medical Corps, appointed to act as adjutant or quartermaster of the Royal Army Medical Corps (Militia) during preliminary drill or training shall receive extra-duty pay at the following rates:—

	Daily. s. d.
Acting Adjutant	2 6
Acting Quartermaster	2 0

Reserve of Officers.

An officer of our Royal Army Medical Corps with at least three, but not more than six, years' service may be permitted by our Army Council to become an Army Reserve Officer for a period of seven years, and while so serving he shall receive pay at the rate of £25 a year. With the sanction of our Army Council such officer may be allowed to return to the active list, and if the period he has been in our Reserve of Officers amounts to at least one year, and not more than three years, he shall be allowed to reckon one-third of such period towards promotion, gratuity, and pension.

Seconded Officers.

A Lieutenant on probation who at the time of passing the examination for admission to the Royal Army Medical Corps holds, or is about to hold, a resident appointment in a recognised civil hospital may be seconded for a period not exceeding one year during which he holds the appointment. While seconded he shall not receive pay from army funds, but his service shall reckon towards promotion, increase of pay, gratuity, and pension.

PROMOTION.

Every promotion of a medical or departmental officer shall be made with the approval of our Secretary of State. Promotion by selection shall be given on the ground of ability and merit, due consideration being given, however, to length of efficient service.

An officer shall be eligible for promotion to the rank of Captain on the completion of three and a half years' service, and to the rank of Major on the completion of 12 years' service, provided that in each case he has previously qualified in such manner as may be prescribed by the Army Council.

Promotion to the rank of Lieutenant-Colonel to complete an establishment shall be made by selection from Majors who have qualified in such manner as may be prescribed by the Army Council.

If an officer has passed with distinction the examination qualifying for promotion to the rank of Major, the period of service required to render him eligible for the rank of Major or Lieutenant-Colonel may be reduced as follows:—

	Months.
If he obtained a "special certificate"	18
,, passed in the 1st Class	12
,, ,, ,, 2nd ,, ...	6
,, ,, ,, 3rd ,, ...	3

Promotion to the rank of Colonel to complete an establishment shall be made by selection from Lieutenant-Colonels and from Lieutenant-Colonels or Surgeon-Lieutenant-Colonels of the Household Troops specially recommended to the Army Council for distinguished service in the field. Promotion to the rank of Surgeon-General shall be made by selection from Colonels. A Colonel may also be promoted to the rank of Surgeon-General for distinguished service in the field. In cases of distinguished service in the field a departmental officer may, with the concurrence of the Lords Commissioners of the Treasury, be promoted from any rank or class to the next above it and shall, if promoted to a rank or class having a fixed establishment, remain supernumerary in such rank or class until the occurrence of the vacancy to which in the ordinary course he would have been promoted. An officer of the Royal Army Medical Corps is eligible for promotion to brevet rank. A Captain after at least 6 years' service, a Major or Lieutenant-Colonel, may be promoted to the next higher rank by brevet for distinguished service in the field or for distinguished service of an exceptional nature other than in the field. If the officer dies before the date on which the notification of his promotion for distinguished service in the field appears in the *London Gazette* the promotion shall bear the date which it would have borne had the officer not died. Distinction in original investigation or research may, in the case of officers of the Royal Army Medical Corps, be regarded as "distinguished service of an exceptional nature other than in the field." An officer who does not qualify for promotion to the rank of Captain or Major within the periods specified shall be placed on a special list with pay equal to half-pay until the da of the next succeeding examination, provided a period of eight mo ths is not thereby exceeded. An officer who may in the opinion of the Army Council have been prevented, in very special circumstances, from qualifying for promotion, or who, having failed to qualify, may have been debarred from further opportunity of qualifying, may be provisionally promoted. If, however, he fails to qualify on the first available opportunity his promotion shall be cancelled and he shall be retired from the service. An officer shall reckon towards his promotion any time, not exceeding one year, during which he may have been on half-pay on account of ill-health caused by military service; and also any time not exceeding two years during which he may have been on half-pay on reduction. An officer while seconded shall continue to be eligible for selection for promotion as if he had remained on the establishment, and his service while seconded shall reckon towards such promotion.

RANK.

The Director-General of the Army Medical Service shall hold the substantive rank of Surgeon-General and shall rank in relation to combatant officers as a Lieutenant-General if recommended by the Army Council. All other Surgeon-Generals shall rank as Major-Generals in relation to combatant officers.

RETIREMENT.

An officer of the Army Medical Service will be permitted to retire in candidates for commissions (including preliminary examinations) will be entered in their reports in the following manner:—

Sufficient ... ... { Right eye ... V =
{ Left eye ... V =
Defective ... ... { Right eye ... V =
{ Left eye ... V =

No relaxation of the standard of vision will ever be allowed.

The following additional points will then be observed. (b) That his hearing is good. (c) That his speech is without impediment. (d) That his teeth are in good order. Loss or decay of the teeth will be considered a disqualification Decayed teeth if well filled will be considered as sound. (e) That his chest is well formed and that his heart and lungs are sound. (f) That he is not ruptured. (g) That he does not suffer from varicocele or varicose veins in a severe degree, *or other disease likely to cause inefficiency. A slight defect if successfully* cured by operation is not a disqualification. A definition of severe varicocele may be obtained from the Director-General Army Medical Service, War Office, Whitehall, S.W. (h) That his limbs are well formed and developed. (i) That there is free and perfect motion of all the joints. (j) That his feet and toes are well formed. (k) That he does not suffer from any inveterate skin disease. (l) That he has no congenital malformation or defect. (m) That he does not bear traces of previous acute or [illegible] to an impaired constitution. In any doubtful [illegible] further state: (n) Whether he is in their op[illegible] descent. If a candidate be pronounced physically fit for service at home and abroad he will be eligible to present himself at the next entrance examination which will be held twice in the year, usually in January and July.

The Army Council reserves the right of rejecting any candidate who may show a deficiency in his general education.

An entrance fee of £1 is required from each candidate admitted to the examination and is payable at the conclusion of his physical examination, if pronounced fit.

Candidates who have been specially employed in consequence of a national emergency, either as an officer or in a position usually filled by an officer, will [illegible]rvice towards retired pay and gratuity, and [illegible] age at the date of commencement of th[illegible] shall be permitted to deduct from their actual age any period of that service, if such reduction will bring them within the age limit. The duration of service is to be reckoned from the date on which the candidate commenced such service, except in the case of candidates who have served for two or more periods at short intervals. In such cases the total period of service to be considered in granting marks at the entrance examination shall be specially determined.

A candidate successful at the entrance examination will be appointed a Lieutenant on probation and will be required to pass through such courses of instruction as the Army Council shall decide and, after passing the examinations in the subjects taught and satisfying the Director-General that he possesses the necessary skill, knowledge, and character for permanent appointment to the Royal Army Medical Corps, his commission as Lieutenant will be confirmed. The commission shall bear the date of passing the entrance examination.

Before the commission of a Lieutenant on probation is confirmed he must be registered under the Medical Acts in force in the United Kingdom at the time of his appointment.

The precedence of Lieutenants among each other shall be in order of merit as determined by the combined results of the entrance examination and the examinations undergone while on probation, except that the position on the list of a lieutenant on probation, seconded to hold a resident appointment in a recognised civil hospital shall be determined by the place he has gained at the entrance examination. A lieutenant so seconded will be required, at the conclusion of his hospital appointment, to attend the course of instruction at the Royal Army Medical College; but the subsequent examinations will be of a qualifying character and will not influence his position on the seniority list of the Corps.

Lieutenants when appointed on probation will receive instructions as to the provision of uniform.

EXAMINATIONS.

Subjects for the Entrance Examination.

Candidates will be examined by the examining board in medicine and surgery. The examination will be of a clinical and practical character, partly written and partly oral, marks being allotted under the following scheme.

Medicine (written).	Maximum marks.
A. Examination and report upon a medical case	125
B. Commentary upon a case in medicine	100
(Two periods of 45 minutes—total, one a half hours—for A and one and a half hours for B.)	
Medicine (oral).	
A. Clinical cases	100
B. Medical pathology	75
(Ten minutes to examine case and ten minutes *viva voce*—total, 20 minutes—for A; 30 minutes to examine specimens and ten minutes *viva voce*—total, 40 minutes—for B.)	
Surgery (written).	
A. Examination and report upon a surgical case	100
B. Commentary upon a case in surgery	125
(Two periods of 45 minutes—*total, one and a half* hours—for A and one and a half hours for B.)	
Surgery (oral).	
A. Clinical surgery and pathology (including diseases of the eye)	75
B. Operative surgery and bandaging (including surgical instruments and appliances)	100
(Ten minutes to examine case and ten minutes *viva voce*—total, 20 minutes—for A, and about 30 minutes for B.)	
Total marks	800

The following headings are published as a guide to candidates in drawing up their reports on cases:—(a) A brief history of the case as given by the patient, including such points only (if any) in the family or personal history as have a distinct bearing upon the present illness or incapacity. (b) A detailed account of the subjective symptoms and physical signs elicited by the candidate's personal examination of the patient, noting the absence of any which might be expected to be present in a similar case. (c) Where there is any reasonable doubt in the mind of the candidate as to an exact diagnosis he is to give the alternatives, with his reasons for making the selection. (d) A commentary upon the case as a whole, pointing out the symptoms which [illegible] and those which appear to be [illegible] (e) Suggestions as to treatment [illegible]ary at a later date. (f) A for[illegible]ation of the case.

Similarly the commentary on the report of a case submitted to the candidate should discuss: (a) The family and personal history and other conditions preceding the development of the condition described. (b) The relative significance of the physical signs, symptoms, other indications of disease noted, and the general clinical aspects of the case. (c) The diagnosis, with reasons for selection of the most probable, when a positive diagnosis cannot be attained. (d) The treatment, dietetic, medicinal, operative, &c., including a criticism of the plan adopted, and alternative schemes of treatment in case of disagreement. (e) The morbid appearances and an account of the post-mortem examination (if any).

The examination will be held in London and will occupy about four days.

The appointments announced for the competition will be filled up from the list of qualified candidates arranged in the order of merit, as determined by the total number of marks each has obtained. Having gained a place in this entrance examination the successful candidates will be ordered to proceed to the Royal Army Medical College for instruction in recruiting duties, at the termination of which they will join the Royal Army Medical Corps School of Instruction at Aldershot for a two months' course in the technical duties of the corps and at the end of the course will be examined in the subjects taught. The maximum number of marks obtainable at this examination will be 100. On completion of the above course lieutenants on probation will rejoin the Royal Army Medical College to undergo two months' instruction in Hygiene, Pathology, Tropical Medicine, Military Surgery, and Military Medical Administration, after which they will be examined in these subjects. The maximum number of marks obtainable at this examination will be 700. At the present time the professors at the Royal Army Medical College are Major C. G. Spencer, M.B., F.R.C.S., in the department of military surgery; Lieutenant-Colonel Robert J. S. Simpson, M.B., C.M.G., in the department of military medicine; Major W. B. Leishman, M.B., in the department of pathology; and Lieutenant-Colonel A. M. Davies in that of hygiene, Major W. S. Harrison, M.B., and Major C. E. P. Fowler, F.R.C.S., both of the Royal Army Medical Corps, being the respective assistant professors. Colonel H. R. James, F.R.C.S., the commandant of the Royal Army Medical College, instructs in hospital and corps administration, in the duties of officers on transports, and in the examination of recruits, and Brevet-Colonel F. J. Lambkin lectures on Syphilology. The course of hygiene has hitherto comprised the examinations of water and air, the general principles of diet with the quality and adulterations of food and beverages, the sanitary requirements of barracks, hospitals, and camps, the consideration of the clothing, duties, and exercises of the soldier, and the circumstances affecting his health, with the best means of preventing disease and instruction in the mode of preparing the various statistical and other returns required of the medical officer. The pathological course has up to the present time included bacteriology and demonstrations in physiological chemistry. The surgical course consists of lectures and demonstrations in military surgery and lectures on errors of refraction from a military point of view. On completion of the above course Lieutenants on probation will be ordered to proceed to the depôt of the Royal Army Medical Corps at Aldershot for a three months' course of instruction in the technical duties of the corps, and at the end of the course will be examined in the subjects taught. A Lieutenant on probation who fails to qualify in either of these examinations will be allowed a second trial, and, should he qualify, will be placed at the bottom of the list. Should he again fail in either examination his commission will not be confirmed. Illiteracy on the part of a candidate as evinced by inaccurate spelling, poor composition, or grammatical errors in the oral examination, at the entrance examination, or at the examinations undergone while on probation will be regarded as disqualifying for appointment.

EXAMINATIONS FOR PROMOTION IN THE ROYAL ARMY MEDICAL CORPS.

These examinations are intended to test the progress and proficiency of officers in those branches of knowledge which are essential to their continued efficiency.

Lieutenant before Promotion to Captain.—(For Lieutenants appointed after March 31st, 1901.) This examination may be taken at any time after completing 18 months' service and will be held in the military

WIDOWS' PENSIONS.

Widows' pensions and compassionate allowances for children and other relatives of deceased officers are given under certain conditions specified in the Royal Warrant for Pay and Promotion. There is also an Army Medical Officers' Widows' Annuity Fund on mutual assurance principles.

ROYAL ARMY MEDICAL CORPS IN INDIA.

Under the Indian commands reorganisation scheme it is ordered that: (*a*) The appointments of principal medical officer, personal assistant to the principal medical officer, sanitary officer, and staff officer, Army Bearer Corps, in each command, and of sanitary officer and staff officer. Army Bearer Corps, in the Secunderabad Division and Burma, will be abolished. (*b*) The principal medical officers of the three divisions will be surgeon-generals, their pay being fixed at 2200 rupees per mensem, consolidated. (*c*) Two temporary administrative posts will be created. each to be held by a colonel—viz.: one for the Allahabad and the second for the Secunderabad brigades, infantry and cavalry. (*d*) A colonel will be appointed deputy to the principal medical officer of His Majesty's forces in India, his pay being fixed at 1800 rupees a month, consolidated. (*e*) A sanitary officer will be appointed in each office of the nine divisions and in Burma, the staff pay being fixed at 300 rupees per mensem. (*f*) A staff officer for medical mobilisation stores will be appointed in each of the nine divisions (excluding Burma). the staff pay being fixed at 300 rupees per mensem. (*g*) Owing to the above changes the establishments of medical services in India will be reduced by a number of officers corresponding to the number of cadre appointments abolished. (*h*) Existing lady superintendents will, under the orders of the principal medical officer of His Majesty's forces in India, be distributed to the charge of four circles, as follows: First Circle, comprising Peshawar, Rawul Pindi, and Lahore Divisions; Second Circle, comprising Meerut and Lucknow Divisions; Third Circle, comprising Quetta, Mhow, and Poona Divisions: Fourth Circle, comprising Secunderabad Division and Burma. (*i*) Orders regarding the disposal of clerks and establishments of the medical division officers at command headquarters will be issued by the principal medical officer, His Majesty's forces in India.

REGULATIONS FOR ADMISSION TO THE ARMY MEDICAL RESERVE.

CANDIDATES FOR COMMISSIONS.

Qualifications.

1. A candidate for a commission in the Army Medical Reserve must not be over 30 years of age at the date of his appointment.

2. He must be registered under the Medical Acts in force in the United Kingdom at the time of his appointment.

3. He must complete the form of application and declaration shown hereafter.

Appointment and Promotion.

4. If his application is approved the candidate will be directed to present himself at a military station convenient to his place of residence, in order that he may be examined by an *officer of the Royal Army Medical Corps* as to his physical fitness for a commission.

5. The standard of physique required will be that laid down for candidates for the Royal Army Medical Corps.

6. If selected, he will be appointed a Lieutenant on probation, and will be required to undergo a course of instruction at the Depôt, Royal Army Medical Corps, at Aldershot, for *two months*. *Classes* will begin about 1st February, 1st July, and 1st September in each year, and a candidate will, as far as possible, be permitted to select the class most convenient to him. At the conclusion of this course he will be examined as to his fitness to have his commission confirmed.

7. Commissions will date from time of joining the class of instruction at the Depôt.

8. Lieutenants when appointed will be required to provide the following articles of uniform, towards the expense of which an allowance of £5 will be issued:—

Cap, field service, khaki.
Frock, khaki.
Pants, khaki, 1 pair.
Puttees, khaki, 1 pair.
Boots, regulation, brown, 1 pair.
Sam Browne belt and sword.

9. Before becoming eligible for promotion to Captain, a Lieutenant will be required to undergo a second course of instruction for one month, at the conclusion of which he will be examined as to his fitness for such promotion.

Conditions of Service.

10. Officers of the Army Medical Reserve will be liable to be called to army service at home or abroad at a time of emergency.

11. Officers of the Army Medical Reserve who are willing to offer their services in times of peace will be considered for employment with troops in the locality in which they reside.

12. *Extracts from the Royal Warrant for Pay and Promotion.*

The following extracts are given for the information of candidates:—

Commissions as Lieutenants in Our Army Medical Reserve may be given to persons, not over 30 years of age, who may be duly qualified under regulations approved by Our Army Council. (Art. 654.)

The ranks of officers of Our Army Medical Reserve shall be those o Captain and Lieutenant, and the total period of service in the Reserve shall be limited to seven years. On the completion of three and a half years' service a Lieutenant shall be eligible for promotion to the rank o Captain, if recommended for that rank. (Art. 655.)

Appointments to commissions will be made on probation, and persons so appointed will undergo an initial training of two months, on the expiration of which, should their work and conduct be considered satisfactory, their commissions will be confirmed. Officers of the Reserve before promotion to the rank of Captain shall fulfil such conditions as Our Army Council may determine, and shall undergo one month's further training. (Art. 655.)

When called to army service, or while undergoing training, officers o the Reserve shall receive the pay and allowances of officers of similar rank in the Royal Army Medical Corps. After the first year's service an officer shall, in addition to any such pay and allowances for days of actual service, receive pay at the rate of £20 a year. This rate shall be increased to £25 a year if the Officer is promoted to the rank of Captain. (Art. 657.)

Officers of the Army Medical Reserve will be subject to the general regulations applicable to Army Reserve Officers as laid down in the *following extracts from the Pay Warrant*, so *far* as such regulations do not conflict with those laid down in the foregoing Articles.

Officers who volunteer for service in the Reserve of Officers, and whose services are *accepted*, shall *receive commissions from Us as* officers in Our Land Forces. (Art. 660.)

An Army Reserve Officer shall report himself at the commencement of each year, in writing, to Our Army Council. Should he fail to do so he shall (unless he is an *officer* retired from Our Regular Forces, with liability for further service in case of emergency) be removed from Our Reserve of Officers at the end of the year in which he fails to report himself. (Art. 662.)

An Army Reserve Officer shall, if his services have been of a special character and if recommended to Us by Our Army Council, be eligible on retirement for a step of substantive or *honorary* rank, or of brevet rank for distinguished service. (Art. 664.)

An Army Reserve Officer may, with his own consent and the sanction of Our Army Council, be employed on Army Service at any time. Art. 667.)

Application of a Candidate for a Commission in the Army Medical Reserve.

1. Name in full ... ...
2. Address ... ...
3. Date of birth* ... ...
4. Qualifications ... ...
5. Academic and other distinctions ....
6. Medical school in which the candidate completed his course as a medical student ... ...
7. Name of a person of position and responsibility who can be referred to as to candidate's character, conduct, and fitness to hold His Majesty's Commission ... ...

Declaration.

I hereby declare upon my honour that the above statements are true to the best of my knowledge and belief, and further—

1. That I am a British subject of unmixed European blood.

2. That I am not, as far as I know, at present suffering from any mental or bodily infirmity, or physical imperfection or disability that is likely to preclude me from efficiently discharging the duties of an officer in any climate.

3. That I will fully reveal when physically examined all circumstances within my knowledge that concern my health.

I also declare that my vision is good with either eye (with or without the aid of glasses as the case may be).

Signature..

Date..

(N.B.—A misstatement by the candidate will invalidate any subsequent appointment and cause forfeiture of all privileges for services rendered.)

All communications to be addressed to the Secretary, London, S.W.

* A certificate of registration of birth or other satisfactory evidence of age, such as a declaration made before a magistrate by one of his parents or guardians, giving the date of his birth, to be furnished.

INDIAN MEDICAL SERVICE.

The grades of officers in the Indian Medical Service are the same as those of the Army Medical Service and Royal Army Medical Corps. The Director-General will rank either as Major-General or Lieutenant-General as may be decided in each case by the Secretary of State for India in Council.

REGULATIONS FOR THE EXAMINATION OF CANDIDATES FOR ADMISSION TO THE INDIAN MEDICAL SERVICE.

Candidates must be natural born subjects of His Majesty, of European or East Indian descent, between 21 and 28 years of age at the date of the examination, of sound bodily health, and in the opinion of the Secretary of State for India in Council in all respects suitable to hold commissions in the Indian Medical Service. They may be married or unmarried. They must possess a diploma or diplomas entitling them under the Medical Acts to practise both medicine and surgery in Great Britain and Ireland. Examinations for admission to the service usually take place twice in the year—in January and July.

They must subscribe and send in to the Military Secretary, India Office, Westminster, so as to reach *that address by the date fixed in the advertisement of the examination*, a declaration according to the annexed form.

cases in which such retirement may be deemed expedient by the Secretary of State.

Scale of Retired Pay.

	Yearly. £
Director General after 3 years' service in the appointment (with 30 years' service)	1125
Under 3 years' service as Director General and after not less than 30 years' service	875
	Daily. £ s d.
Surgeon General	2 0 0
Colonel promoted on, or after, the 9th January, 1907—	
Under 4 years' service as such, but with 30 years' total service	1 15 0
After 4 years' service as such	1 10 0
If not qualified as above	the rate for a lieutenant-colonel.
Surgeon-Lieutenant-Colonel of the Household Troops—	£ s d.
After 20 years' service	1 0 0
" 25 "	1 2 6
" 30 "	1 5 0
Lieutenant-Colonel, *promoted on, or after, the* 9th January, 1907—	
After 20 years' service	1 0 0

After 15 years' service	1800
" 18 "	2500

Except in the case of a Colonel promoted after the 9th January, 1907, or a Lieutenant Colonel, an officer of our Army Medical Service, who, on voluntary retirement, has served for less than three years in the rank from which he retires, shall be entitled only to the gratuity *or* retired pay assigned to the next lower rank.

Retirement on Account of Age or Limitation of Period of Service.

The Director General of the Army Medical Service shall retire on completion of the term of his appointment, and the retirement of other officers of the Army Medical Service except Quartermasters) shall be compulsory at the following ages Surgeon General, 60, *Colonel,* 57, *and other officers,* 55 *A Major shall retire on completion of* 25 years' service if he has been superseded for promotion; or, if he fails to qualify for promotion, on completion of 20 years' service. A Lieutenant placed on the special list shall be *retired* if he fails to qualify at the next succeeding examination. A Captain placed on the special list under Article 361 shall, if he fails to qualify at the next succeeding examination, be retired at once on any gratuity for which he may be eligible, and if not so eligible shall be retired as soon as he completes five years' service in the rank of Captain It shall be competent to the Secretary of State to place a medical officer on the retired list after 30 years' service.

Retirement on Account of Medical Unfitness.

An officer of the Army Medical Service or a medical officer of the Royal Malta Artillery placed on the half pay list on account of medical unfitness shall, if not previously retired, be retired from the Army at *the expiration of five years from the date on which he was placed on* the half pay list, or, if reported by the regulated medical authority to be permanently unfit for duty, on the officer's application, at such earlier date as may be decided by the Army Council

An officer, whether on full pay or half pay, who, to the satisfaction of the regulated medical authority has been pronounced insane, shall be retired from the Army with the retired pay to which he would be entitled if reported by the regulated medical authority to be permanently unfit for duty If his disability was not caused by military service and he is not entitled to permanent retired pay by length of s[illegible] l pay equivalent to the half pa[illegible] ich he would have received .f [illegible] y.

Rates for Officers not qualified for Retired Pay on Voluntary Retirement

If the unfitness was caused by military service retired pay equal to the half pay of his rank If not so caused, provided the officer has at least 12 years' service, retired pay equal to the half pay of his rank for such period only, not exceeding five years from the date of the officer's retirement from the Army, after five years on half pay under Article 306, as the *Secretary of State shall determine according to the* merits of the case

King's Honorary Physicians and Honorary Surgeons

Six of the most meritorious officers of the Army Medical Service on the active list shall be named Honorary Physicians and six Honorary Surgeons. *On appointment as* Honorary Physician or Honorary Surgeon an officer under the rank of Colonel in the Army Medical Service may be promoted to the brevet rank of Colonel A Lieutenant-Colonel ap pointed Honorary Physician or Honorary Surgeon shall receive pay at the rate laid down for a Colonel of the *Royal Army Medical Corps* when qualified for promotion to that rank An officer shall relinquish the appointment of Honorary Physician or Honorary Surgeon on etirement.

Medical Officers of the Regiments of Household Troops.

Household Cavalry

Commissions as surgeon lieutenants in our Household Cavalry shall be given, on the nomination of the titular colonels of the regiments, to persons approved by our Army Council

Promotion.

Household Cavalry.

A Surgeon-Lieutenant shall be eligible for promotion to the rank of Surgeon Captain on completing three and a half years' service and a *Surgeon-Major for promotion* to the rank of Surgeon Lieutenant Colonel on completing 20 years' service Promotion from Surgeon Captain to Surgeon-Major *shall be by seniority on the medical* establishment of the brigade, *but only on a vacancy occurring for* such promotion

A S[illegible] L[illegible]tenant, S[illegible]geon Captain, or Surgeon Major of our [illegible] omoted for distinguished service in the [illegible] down in Article 327.

Pay.

	Daily £ s d
Surgeon-Lieutenant Colonel	1 10 0
Surgeon-Major	1 3 6
After three years' service as such	1 6 0
Surgeon Captain	0 15 6
After seven years' service	0 17 0
After ten years' service	1 1 0
Surgeon Lieutenant	0 14 0

Promotion

A medical officer of our Household Troops shall be eligible for extra pay under the provisions of Articles 367 and 368.

General Regulations

In all matters not provided for by Articles 382 to 387 and 555 to 562 the medical officers of our Household Troops shall be governed by the general regulations for regimental officers of our army.

Exchanges and Transfers.

An officer of the Royal Army Medical Corps shall be permitted to exchange with another officer of such corps, or with a medical officer of the *Household* Troops, under such conditions and regulations as may from time to time be made

A medical officer of the Household Troops may be permitted to exchange with an officer of the Royal Army Medical Corps, provided that an officer exchanging into the Royal Army Medical Corps has fulfilled any conditions as to service abroad required of officers of such corps

Exchanges between officers of the Royal Army Medical Corps under the rank of Major and medical officers of the Indian Army, and *transfers of such officers from either of the above services to the other,* shall only be permitted subject to the approval of the Secretary of State for India in Council and on the following conditions (1) That the officers have less than seven years' service, (2) that the senior officer exchanging takes the place of the junior on the list and shall not be promoted until the officer next above him has been so promoted, (3) that the junior officer exchanging is placed for seniority next below all medical officers whose commissions have the same *date* as *his own*, and (4) that the officer transferred is placed for seniority below all *medical officers* holding the same rank at the time of his transfer and shall not be promoted until the officer next *above him* has been promoted.

An officer of the Royal Army Medical Corps who has exchanged or *been transferred from the Indian Army* shall reckon, subject to the conditions of *Article 364*, his previous *service with* the said forces towards promotion, increase of pay, gratuity, and pension.

Leave of Absence.

Full pay during ordinary leave of absence for the period admissible in the case of a staff officer may be granted to a medical officer provided that no additional expense is incurred thereby.

When the periods of leave referred to in Article 457 have been exhausted or exceeded in consequence of sickness no further pay during ordinary leave shall remain due

Sick Leave

An officer of the Army Medical Service may be allowed full pay during *sick leave of absence on the same conditions as those* laid down for regimental officers

A regimental officer may draw full pay for the undermentioned periods during sick leave granted on the recommendation of the regulated medical authority, provided there is reasonable probability that he will ultimately be fit to return to duty —

1 In *ordinary* cases for a *period not exceeding* 12 months
2 In very special cases, such as loss of health due to tropical service or to active operations, the period may be extended, but it shall not exceed 18 months in all. (Article 298)

When a medical officer is sick at his station, whether in hospital, quarters, *or lodgings, his absence from duty on account of sickness,* if not exceeding 30 days in duration, and if duly certified by a medical officer, shall not be included in the period of absence on leave to which the issue of pay is limited by Article 457, provided the general officer commanding at the station considers that the circumstances of the case warrant such a concession. Any excess of such *leave of absence* on account *of sickness* at an *officer's station beyond the period* of 30 days shall come under the provisions of Article 458

Service on the West Coast of Africa.

An officer volunteering for, or ordered to, the *West Coast of Africa* shall receive double pay while actually serving on the coast, and for any time spent at Madeira or the *Canary* Islands on sick leave, or on ordinary leave not exceeding 61 *days in a year*

For each year's service on the coast a medical officer shall be entitled to full pay during 183 days' leave at home and for every additional *period beyond a year* he shall have a proportionate extension of full pay during leave

Each year or portion of a year served on the West Coast of Africa by an officer of the Royal Army Medical Corps shall reckon double towards voluntary retirement or retired pay, *provided that* he has served 12 months on the coast In ordinary cases the 12 months may be made up of two separate periods of not less than six months each, and if an *officer leaves the coast on account* of sickness he may reckon any period *of* service on the coast, however short in order to make up the 12 months' coast service which is required to entitle him to count his service double. Except when the officer has been invalided, any broken period, if amounting to less than six *months'* of service on the coast, and leave on full pay, shall not reckon double under this article now set aside to be competed for by the lieutenants-on-probation of the Royal Army Medical Corps, while the Webb prize and the Pathology prize are competed for by the young officers of both services. The two Montefiore prizes are open to the competition of the lieutenants-on-probation of the Indian Medical Service, and the Martin Memorial Gold Medal is competed for by the lieutenants-on-probation for the same service after the course in Military Medicine. The Maclean prize was withdrawn on the abolition of the Army Medical School and foundation of the Medical Staff College. The Herbert Prize of £20 is awarded to the lieutenant-on-probation who has obtained the highest number of marks at the Staff College examination in London; the Parkes Memorial Bronze Medal to the one who gains the highest number of marks in the examination in hygiene; the de Chaumont prize of books to the one who takes second place in Hygiene; the Montefiore Medal and £21 are awarded for Military Surgery; the Montefiore Second Prize, a cheque to the lieutenant-on-probation who obtains the second highest number of marks in this branch; a prize of books is given for the highest number of marks gained in Pathology; and the Marshall Webb prize of £5 and a bronze medal is awarded for Hospital Administration.

At the close of the session those lieutenants-on-probation who have obtained one-third of the possible total of marks and have satisfied the authorities that they possess the necessary skill, knowledge, and character for permanent appointment are recommended for commissions as Lieutenants in the Indian Medical Service.[4]

Officers on appointment are, when possible, provided with passage to India by troop transport; when such accommodation is not available passage at the public expense is provided by steamer, or a passage allowance granted if preferred. A charge for messing during the voyage is made at the rate of *2s.* a day. This payment does not include the cost of liquors, which are charged for as extras. Any officer who may neglect or refuse to proceed to India under the orders of the Secretary of State for India within two months from the date of terminating his course of instruction, or within 14 days of the termination of his hospital appointment if the Secretary of State has permitted him to hold one will be considered as having forfeited his commission unless special circumstances shall justify a departure from this regulation.

APPENDIX I.

CERTIFICATES OF AGE AND NATIONALITY REQUIRED BY NATIVES OF INDIA.

MEDICAL DEPARTMENT.

he Governor-General in Council is pleased to publish the following es under which certificates of age and nationality will be issued to lives of India who are candidates for the examinations for the Indian dical Service held in England:—

General Rules applicable to all Candidates.

A candidate for admission to compete in England for the Indian dical Service is required before leaving India to obtain a certificate age and nationality, signed, should he be a resident in British India, the Secretary to the Government of the Province or the Commissioner of the Division within which his family resides, or, should he side in a native State, by the highest Political Officer accredited to e State in which his family resides.

Note.—In the case of a candidate who has proceeded to England ithout obtaining a certificate the certificate may be granted to his ther or guardian, provided that the latter produces the requisite idence, and, when making the application, states when the candidate ent to England and where he has been residing during his stay in at country.

In order to obtain a certificate, a candidate is required, if resident in British India, to prove the date and place of his birth before the magistrate of the district in which his family resides, or, if resident in a native State, before the Political Officer of the State in which his family resides.

A candidate must, if resident in British India, signify to the Secretary to the Government of the Province or the Commissioner of the Division in which his family resides his desire to compete not less than three months before the date on which he proposes to go to England. If resident within a Native State, he must signify his desire in like manner to the highest Political Officer accredited to the State within which his family resides.

The officer to whom the application is made shall forward it for the purpose of inquiry to the Magistrate of the district or Political Officer of the State in which the applicant's family resides.

The Magistrate or Political Officer to whom such application has been forwarded shall call upon the candidate to appear and give evidence of the date and place of his birth and of his nationality within one month. He will carefully examine into the value of the evidence given and forward a summary of it, with certified copies of all documents tendered, and his comments and opinion, to the officer who forwarded the application to him for inquiry.

The documentary evidence which a candidate may be expected to produce comprises—(*a*) the horoscope; (*b*) family books; (*c*) tradesmen's account books showing entries relating to the birth; (*d*) the record of admission in the registers of the school in which the candidate was educated and the record of the candidate's age at various periodical school examinations; and (*e*) if the candidate is matriculated a certified copy of his application to the Registrar.

Oral testimony of persons acquainted with the candidate's family or otherwise able to give relevant evidence, will also be taken; and the candidate is required to comply to the best of his power with any requisition the Magistrate or Political Officer, as the case may be, may make in order to clear up any doubt as to the purport of the documentary proof.

Any declaration of age made after the application of these rules on the occasion of seeking admission to any university examination, educational institution, or Government office, or otherwise recorded in a formal and deliberate manner, will be taken as conclusive evidence in disproof of the subsequent assertion by the same person that he is of different age to that so declared or recorded.

Rules to apply to Candidates Born in His Majesty's Dominions.

If the Secretary to Government, Commissioner of a Division, or the highest Political Officer accredited to the State, as the case may be, shall be satisfied by the papers submitted that the candidate has stated the date and place of his birth correctly, he will issue a certificate declaring that the candidate has submitted the proofs of his birth to the Magistrate of the district or the Political Officer of the State, as the case may be, and has satisfied him that he was actually born on or about the dates stated by him, viz., the day of , at , a place within His Majesty's Dominions. The nature of the evidence produced by the candidate must be stated in the certificate, which shall be given in the following form:—

> I hereby certify that , who is a candidate for the Indian Medical Service, has submitted the proofs of his birth detailed below, and has satisfactorily shown that he was actually born on or about the date stated, viz., the day of , at , a place within His Majesty's Dominions.
>
> (Here enter details.)

* * * * * * *

If the Secretary to Government, Commissioner of a Division, or the highest Political Officer accredited to the State, as the case may be, finds reason to disbelieve that the candidate was born on the day or at the place asserted by him, the certificate will be refused and the candidate will be unable to obtain admission to the competitive examination for the Indian Medical Service.

Where the date and place of the birth have been formally registered in a register kept by any public officer in British India, an extract from the register, duly certified by the proper official, shall be accepted as sufficient proof of the date and place of the birth.

Rules to apply to Candidates not Born within His Majesty's Dominions.

In addition to the particulars required by Rule 2, a candidate not born in His Majesty's Dominions must also prove that he is the son or grandson of a person born in those dominions.

If the Secretary to Government, Commissioner of a Division, or the highest Political Officer accredited to the State, as the case may be, shall be satisfied by the papers submitted that the candidate has stated the date and place of his birth correctly, and has established the fact that, though born without the limits of His Majesty's dominions, he is the son or grandson of a person born in those dominions, he will issue a certificate in the following form, stating the nature of the evidence produced regarding the candidate's birth:—

> I hereby certify that , who is a candidate for the Indian Medical Service, has submitted the proofs of his birth detailed below and has satisfactorily shown that he was actually born on or about the date stated, viz., the day of , and that he was born at , a place without His Majesty's Dominions, but that he is the $\frac{\text{son}}{\text{grandson}}$ of a person born in those dominions.
>
> (Here enter details.)

* * * * * * *

If the Secretary to Government, Commissioner of a Division, or the highest Political Officer accredited to the State, as the case may be, finds reason to doubt that the candidate was born on the day asserted by him, or that he is the son or grandson of a person born in His Majesty's Dominions, the certificate will be refused and the candidate will be unable to obtain admission to the competitive examination for the Indian Medical Service.

A course of instruction in sanitary methods, rules, and regulations as carried out in Indian cantonments was instituted last winter for young officers of the Indian Medical

---

[4] A lieutenant who, within a reasonable period before the date at hich he would otherwise sail for India, furnishes proof of his election a resident appointment at a recognised civil hospital, may be seconded r a period not exceeding one year from the date on which he takes p such appointment, provided that he joins it within three months f passing his final examination and that he holds himself in readiness o sail for India within 14 days of the termination of the appointment. While seconded he will receive no pay from Indian funds, but his ervice towards promotion, increase of pay, and pension will reckon rom the date borne on his commission. In special cases permission may be granted to lieutenants to delay their departure for India, in rder to sit for some further medical examination. Lieutenants remaining in England under such circumstances will receive no pay for any eriod beyond two months from the date of leaving the Royal Army Medical College, unless the period elapsing before the day on which the majority of the lieutenants of the same seniority sail to India exceeds two months, in which case lieutenants allowed to remain in England will receive pay up to that day. In such cases pay will re-commence on the day of embarkation for India. All the provisions of this clause are subject to the general exigencies of the service. Before the commission of a lieutenant-on-probation is confirmed he must be registered under the Medical Acts in force at the time of his appointment. Candidates who have been specially employed in consequence of a national emergency, either as an officer, or in a position usually filled by an officer, will be allowed, under certain circumstances, to reckon such service towards pension.

Declaration and Schedule of Qualifications to be Filled up by Candidates.

1. Name in full... ... ...

7. Medical School in which the candidate completed his course as a medical student, and name of the Dean or other responsible authority ... ...
8. Degrees of B.A. or M.A.; details as to any prizes, university honours, &c. ... ...
9. Registrable qualification ... ...
10. Date of examination at which the candidate proposes to present himself ... ...
11. Date of any previous occasions on which the candidate may have presented himself for examination for admission to the Indian Medical Service, or other examination for the Public Services... ... ...
12. Particulars of any commission or appointment held in the Public Services... ... ...

I, , a candidate for empl ce, do hereby attest my r ceed on duty immediately on being gazetted.

I declare that I labour under no mental or constitutional disease, nor any imperfection or disability that can interfere with the most efficient discharge of the duties of a medical officer.

I hereby declare upon my honour that the above statements are true to the best of my knowledge and belief.

I inclose, in accordance with Paragraph 4 of the Regulations, (*a*) proof of age; (*b*) two certificates of character; (*c*) certificate of having attended a course of ophthalmic instruction; (*d*) evidence of a registrable qualification; (*e*) *in case of natives of India or others educated in that country only*, a certificate from the Director-General, Indian Medical Service.

Signature ....

Date ...., 19 .

Candidates for the Indian Medical Service may, if they like, undergo a preliminary examination by the Medical Board which meets at the lying to the Under Secretary of State, guineas. They must pay their own must be understood, however, not to either direction by the Examining Medical Board immediately prior to the Professional Examination.

The declaration following documents:—*a*. *Proof of age* certificate, or, where such certificate i lidate's own statutory declaration, form of which can be obtained at the India Office, supported, if required by the Secretary of State, by such evidence as he may consider satisfactory. A certificate of baptism which does not afford proof of age will be useless. *b*. A recommendation and certificate of moral character from two responsible persons—not a member of his own family—to the effect that he is of regular and steady habits and likely in every respect to prove creditable to the service if admitted. *c*. A certificate of having attended a course of instruction for not less than three months at an ophthalmic hospital or the ophthalmic department of a general hospital, which course shall include instruction in the errors of refraction. *d*. Some evidence of having obtained a registrable qualification. *e*. In the case of natives of India or others educated in that country the candidate will be required to by the Director-General, Indian Medical person to hold a commission in the Indian

The Secretary of State for India reserves the right of deciding whether the candidate may be allowed to compete for a commission in His Majesty's Indian Medical Service.

The physical fitness of each candidate will be determined by a Board of Medical Officers who are required to certify that his vision is sufficiently good to enable him to pass the tests laid down by the regulations. Every candidate must also be free from all other organic disease and from constitutional weakness or other disability likely to unfit him for military service in India. The standard of eyesight is the same as for the Royal Army Medical Corps and the physical examination is in all respects the same (see under Royal Army Medical Corps). Candidates who pass the physical examination will be required to pay a fee of £1 before b candidate will be permitted to compe detailed regulations as to the physical application to the India Office.

On proving possession of the foregoing qualifications the candidate will be examined by the Examining Board in the following subjects and the highest number of marks attainable will be distributed as follows:—

		Marks.
1.	Medicine, including therapeutics...	1200
2.	Surgery, including diseases of the eye	1200
3.	Applied anatomy and physiology...	600
4.	Pathology and bacteriology	900
5.	Midwifery and diseases of women and children	600
6.	Materia medica, pharmacology, and toxicology	600

N.B.—The examination in medicine and surgery will be in part practical and will include operations on the dead body, the application of surgical apparatus, and the examination of medical and surgical patients at the bedside No syllabus is issued in the subjects of pharmacology and toxicology, but the examination will be conducted so as to test the general knowledge of the candidate. No candidate shall be considered eligible who shall not have obtained at least one *third* of the marks obtainable in each of the above subjects and one *half* of the aggregate marks for all the subjects.

For the clinical examinations each candidate should provide himself with notebook, pencil, e. In drawing up reports on cases the ved, viz.: (*a*) A brief history of the cas such points in the family or personal history as have a distinct bearing on patient's case. (*b*) A detailed account of the subjective symptoms and physical signs elicited by the candidate's personal examination of the patient, noting the absence of any which might be expected to be present in a similar case. (*c*) Where there is any reasonable doubt in the mind of the candidate as to the exact diagnosis he is to give the alternatives, with his reasons for making the selection. (*d*) A commentary upon the case as a whole, pointing out the symptoms which may be considered typical and those which appear to be unusual or only accidental complications. (*e*) Suggestions as to treatment, both immediate and possibly necessary at a later date. (*f*) A forecast of the progress and probable termination of the case.

After passing this examination the successful candidates will be granted about a month's leave and will then be required to attend two successive courses of two months each at Aldershot and at the Royal Army Medical College, Millbank.

The course at Aldershot will include instruction in (1) internal economy, (2) Indian military la stretcher and ambulance drill, (5) c

The course at the Royal Army M (2) military and tropical medicine, logy of diseases and injuries incidental to military and tropical service.

From the day on which the result of the examination is announced lieutenants on probation will receive an allowance of 14*s*. per diem, with quarters (where quarters are not provided, with the usual allowances of a subaltern in lieu thereof), to cover all costs of maintenance, and he will be required to provide himself with uniform (viz., the regulation undress uniform and mess dress of a Lieutenant of the Indian Medical Service, as described in Indian Army Regulations, Vol. VII., with Sam Browne belt, but without the sword).

A lieutenant-on-pr pletion of his course c receive furlough pay sick leave.

Candidates will be required to conform to such rules of discipline as may from time to time be laid down.

At the conclusion of the course candidates will be required to pass an examination on the subjects taught during the course of instruction.

Officers appointed to the Indian Medical Service will be placed on one list, their position on it being determined by the combined results of the preliminary and final examinations. They will be liable for military employment in any part of India, but in view to future transfers to civil employment, they will stand posted to one of the following civil areas:—(1) Madras and Burma; (2) Bombay with Aden; (3) Upper Provinces—i.e., United Provinces, Punjab, and Central Provinces; and (4) Lower Provinces—i.e., Bengal, and Eastern Bengal and Assam. The allocation of officers to these areas of employment will be determined upon a consideration of all the circumstances, including, as far as possible, the candidate's own wishes. Officers transferred to civil employment, though ordinarily employed within the area to which they may have been assigned, will remain liable to employment elsewhere according to the exigencies of the service.

The prizes formerly open to competition in the old Army Medical School at Netley have been transferred to the Medical Staff College in London and at present they are re-distributed as follows (but the arrangements as regards all the prizes are to be re-made now that all the course is to be attended in London): The Herbert Prize, the Parkes Memorial Bronze Medal, and the de Chaumont prize are

---

[3] In our opinion as long as the lieutenants-on-probation of the Indian Medical Service receive their instruction at the College, the post of Professor of Medicine in the College should be held by a distinguished officer of the Indian Medical Service and not as at present by an officer of the Royal Army Medical Corps who has had no training as a teacher and does not possess any special knowledge of tropical diseases. The lectures on Military Medicine treat of tropical and other diseases to which soldiers are exposed in the course of their service, the mortality and invaliding by disease, in peace and war, at home and abroad, the management of lunatics under the conditions of military service, &c. The lieutenants-on-probation of both services will attend the New Millbank Hospital where they will be taught practically the details of the management of patients in a military hospital, and the registration of their diseases, the duties of invaliding, the modes of filling up the regulation statistical returns, and other service documents. No provision for instruction in lunacy has as yet been made in London. While in London the lieutenants-on-probation for both services now reside at the St. Ermin's Hotel, Westminster. The candidate's commission as lieutenant will bear the date on which the result of the examination is announced, but his ank will not be gazetted until he has passed the final examination.

officers of the Indian Medical Service. Officers are required to perform two years' regimental duty in India before they can be considered eligible for civil employment. The principal appointments, together with the salaries attached to each, are stated in the following table:—

Description of appointment.	Approximate number of appointments in each class.	Salary per mensem.			
		When held by a Lieutenant-Colonel.	When held by a Major.	When held by a Captain.	When held by a Lieutenant.
		Rs.	Rs.	Rs.	Rs.
Inspectors-General of Civil Hospitals	6	2250–2500	—	—	—
Sanitary Commissioner with Government of India	1	2000–2500	—	—	—
Inspectors-General of Prisons	8	1500–2000	—	—	—
Principals of Medical Colleges	2	1650–1800	1200–1300	—	—
Professorial Appointments	23	1500–1650	1050–1150	800–950	750
Sanitary Commissioners ...	6	1500–1800	—	—	—
Deputy Sanitary Commissioners...	13	1350–1500	900–1000	650–800	600
Bacteriological Appointments	5	1500–1600	1050–1150	700–900	650
Superintendents of Central Lunatic Asylums	6	1400–1550	1050–1150	700–900	650
Superintendents of First Class Central Jails	5	1400–1550	950–1050	700–850	650
Superintendents of Second Class Central Jails	5	1300–1450	850–950	600–750	550
Civil Surgeoncies (First Class)	37	1300–1450	850–950	600–750	550
Civil Surgeoncies (Second Class)	171	1200–1350	750–850	500–650	450
Probationary Chemical Examiner	1	—	—	600–750	550

There are also six Chemical Examiners with Rs. 800–1650 per mensem and a number of Port Health Officers with Rs 750–1950 per mensem. Other appointments of Resident Surgeons and Physicians at hospitals, &c., are on salaries ranging from Rs. 700 to 1650 per mensem. There are also a certain number of appointments under the Political Department on salaries ranging from Rs. 450 to 1450 per mensem, exclusive of local allowances.

23. Qualified officers of the Medical Service are also eligible for appointments in the Assay and Mint Departments. The salaries of these appointments are from Rs. 600–2250 per mensem.

TENURE OF OFFICE IN ADMINISTRATIVE GRADES.

The tenure of office of Surgeon-Generals and Colonels is limited to five years. Colonels, if not disqualified by age, are eligible either for employment for a second tour of duty in the same grade or for employment in the higher grade of Surgeon-General by promotion thereto.

Absence on leave in excess of eight months during a five years' tour of duty involves forfeiture of appointment.

Surgeon-Generals and Colonels, on vacating office at the expiration of the five years' tour of duty, are permitted to draw *in India* an unemployed salary of Rs. 1350 per mensem in the former, and Rs. 1000 in the latter case, for a period of six months from the date of their vacating office, after which they are placed while unemployed on the following scale of pay:—

—	Surgeon-General. Per diem.	Colonel. Per diem.
	£ s. d.	£ s. d.
After 30 years' service on full pay	2 5 0	1 14 0
" 25 " " "	2 5 0	1 10 0
" 20 " " " or on promotion, should this period of service not be completed...	2 0 0	1 8 0

A Surgeon-General or Colonel who has completed his term of service and has reverted to British pay may reside in Europe, at the same time qualifying for higher pension.

RETIRING PENSIONS AND HALF-PAY.

Officers of the Indian Medical Service will be allowed to retire on the following scale of pension on completion of the required periods of service:—

After 30 years' service for pension ...	£700 per annum + £350 after three years' active employment in India as a Surgeon-General, or + £250 per annum after five years' active employment as a Colonel or £125 after three years as a *Colonel*. Eight months' absence on leave is allowed to count towards actual service in those grades.
" 25 " " "	£500 per annum.
" 20 " " "	£400 "
" 17 " " "	£300 "

Service for pension reckons from date of first commission and includes all leave taken under the leave rules.

Time (not exceeding one year) passed on temporary half-pay reckons as service for promotion and pension, in the case of an officer placed on half-pay on account of ill-health contracted in the performance of military duty.

Officers of the Indian Medical Service are liable after retirement on pension before completing 30 years' service to recall to military duty in case of any great emergency arising up to 55 years of age.

All officers of the rank of Lieutenant-Colonel and Major are placed on the retired list at the age of 55, and all Surgeons-General and Colonels at the age of 60, but the Director-General is allowed to serve until he has attained the age of 62 years. If a Lieutenant-Colonel has been especially selected for increased pay and he attains the age of 55 years before he becomes entitled to the pension of 30 years' service he may be retained until the completion of such service, and in any special case, where it would appear to be for the good of the Service that an officer should continue in employment, he may be so continued, subject in each case to the sanction of the Secretary of State for India in Council.

Officers placed on temporary or permanent half-pay are granted half-pay at the following rates.

—	Rates of Half-pay.*	
	Per diem.	Per annum.
	£ s. d.	£ s. d.
Under 5 years' service	0 6 0	109 10 0
After 5 "	0 8 0	146 0 0
" 10 "	0 10 0	182 10 0
" 15 "	0 13 6	246 7 6
Lieutenant-Colonel, under 3 years' service as such	1 0 0	365 0 0
Lieutenant-Colonel, over 3 years' service as such	1 7 6	501 17 6

* Officers cannot retire *in India* on half-pay (No. 45, Feb. 28th, 1865).

An officer of less than three years' service, although he may be transferred to the half-pay list under the general conditions of transfer, will not be granted any half-pay unless his unfitness has been caused by service.

INVALID PENSIONS

An officer who has become incapacitated for further service in India on account of unfitness caused by duty may, after he has been two years on temporary half-pay, be granted an Invalid Pension on the following scale:—

	Per annum.
After 16 years' pension service	£272
" 15 " " "	252
" 14 " " "	232
" 13 " " "	212
" 12 " " "	192

WOUND PENSIONS.

Officers are entitled to the same allowances on account of wounds received in action and injuries sustained through the performance of military duty as are granted to combatant officers of His Majesty's Indian Military Forces holding the corresponding military rank.

FAMILY PENSIONS.

The claims to pension of widows and families of officers are treated under the provisions of such Royal Warrant regulating the grant of pensions to the widows and families of British officers as may be in force at the time being.

The widows and families of officers are also entitled to pensions under the Indian Service Family Pension Regulations, for the benefits of which all officers must, as a condition of their appointment, subscribe from the date of their arrival in India, except in the case of natives of India, for whom it is optional.

HONOURS AND REWARDS.

Officers of the Indian Medical Service are eligible for the military distinction of the Order of the Bath and for other Orders, British and Indian, and for good service pensions. Six of the most meritorious officers are named Honorary Physicians and six are named Honorary Surgeons to His Majesty. On appointment as Honorary Physician or Surgeon an officer below the rank of Colonel is promoted to that rank, remaining supernumerary until absorbed. A retired officer appointed Honorary Physician or Surgeon to the King is granted the honorary rank of Colonel, if on retirement he had not attained to that rank.

NOTE.—The following is a list of recognised Civil Hospitals.—England and Wales.—London: St. Bartholomew's Hospital, Charing Cross Hospital, Guy's Hospital, King's College Hospital, London Hospital, Middlesex Hospital, St. George's Hospital, St. Mary's Hospital, St. Thomas's Hospital, University College Hospital, and Westminster Hospital. Birmingham: General Hospital and Queen's Hospital. Bristol: Royal Infirmary and General Hospital. Cambridge: Addenbrooke's Hospital. Cardiff: Cardiff Infirmary. Leeds: General Infirmary. Liverpool: Royal Infirmary and Southern Infirmary. Manchester: Royal Infirmary. Newcastle-on-Tyne: Royal Infirmary. Oxford: Radcliffe Infirmary. Sheffield: Royal Infirmary and Royal Hospital. Scotland.—Aberdeen: Royal Infirmary. Dundee: Royal Infirmary. Edinburgh: Royal Infirmary. Glasgow: Royal Infirmary and Western Infirmary. Ireland.—Belfast: Royal Victoria Hospital. Cork: North Infirmary and South Infirmary. Dublin: the Adelaide Hospital, the City of Dublin Hospital, the Jervis Street Hospital, the Mater Misericordiæ Hospital, the Meath Hospital, Mercer's Hospital, the Richmond, Whitworth, and Hardwicke Hospital, St. Vincent's Hospital, Sir Patrick Dun's Hospital, and Dr. Steeven's Hospital. Galway: The County Hospital and the Union Hospital.

The Royal Army Medical Corps is at the present time, we believe, a contented service, though the Director-General A.M.S. is excluded from the Army Council, before which he will, however, be summoned whenever his advice and specialist knowledge are required. The relationship of the Director-General to the War Council should be direct and

Service and the Royal Army Medical Corps on first arrival in the country. The nature of the diseases to be combated, the social and religious customs and prejudices of the various races, and the limited resources of money and material make large modifications from European methods necessary. Lieutenants of both services are now posted on arrival either to Rawal Pindi, Poona, Lucknow, or Bangalore for one month for this course, which is carried out under the supervision of the senior medical officer and sanitary officer. The instructors are medical officers nominated by the principal medical officer, India, and demonstrations on various subjects have been given by other officers, staff, engineer, and medical. The course consists of demonstrations and inspections in all parts of the lines of British and Indian troops, bazaars, Government dairies, bakeries, slaughter-houses, trade premises of dairymen, bakers, butchers, and aerated water manufacturers and hobies' houses, market and water-supplies, methods of washing clothes, surface drainage, removal and disposal of sewage and refuse, antimalarial measures, disinfection, cantonment hospitals, control of venereal diseases, plague prevention, methods of hospital administration, &c. The officers under instruction thus have an opportunity of learning something of native customs and are encouraged to learn the vernacular, so as to be less dependent upon their subordinates when first put in responsible positions.

A Lieutenant may be promoted to the rank of Captain on completing three years' full-pay service from the date of first commission, but after completing 18 months' service and before promotion to the rank of Captain he will be required to pass an examination in military law and military medical organisation, the result of which may affect his promotion. With reference to the extract from the *Gazette of India*, Medical Department, No. 1047, dated Oct. 24th, 1903, paragraph 4, it is notified that the Government of India has decided that the scope of the examination which lieutenants of the Indian Medical Service will be required to pass after completion of 18 months' service will be as follows: Subject (*h*) Text-books, the relevant portions of the Army Regulations of India, vols. ii. and vi., and the Field Service Departmental Code (Medical). Subhead (*a*) (2): The duties of the subordinate *personnel* of native military hospitals and the preparation of returns and requisitions connected therewith. Subhead (3): The duties of executive medical officers of the Indian Medical Service. Subject (*d*), subhead (2): Indian military law and Indian articles of war as laid down for officers of the Supply and Transport Corps in G.O.C.C. 897 of 1902. One paper will be set in each of subheads (2) and (3) of subject (*h*). The time allowed for each paper will be three hours. The examinations will take place at district headquarters twice annually, on March 1st and Oct. 1st, simultaneously with those for other officers, commencing on Oct. 1st, 1904. The standard required will be for a pass 5 in (*h*) and 5 in law: for special certificate 8 in (*h*) and 8 in law. An officer may present himself for examination in the above subjects either separately or conjointly. The above rules apply only to officers appointed to the Indian Medical Service on or after Jan. 31st, 1900. The names of candidates for examination will be submitted by general officers commanding districts to the Director of Military Education in India so as to reach that officer by Sept. 1st and Feb. 1st annually. Captains are promoted to the rank of Major after 12 years' full-pay service, but this promotion is accelerated by six months in the case of officers who fulfil certain specified conditions. A Major is promoted to Lieutenant-Colonel on completion of of eight years' full-pay service in the rank of Major. All promotions to higher grades are given by selection for ability and merit. In case of distinguished service in the field a medical officer may receive substantive or brevet rank. The ages for compulsory retirement are the same as those for the Royal Army Medical Corps. Officers of the Indian Medical Service below the rank of Colonel may be granted: 1. Privilege leave under such regulations as may from time to time be in force. 2. Leave out of India for no longer period than one year, capable of extension to two years' absence from duty, on the following pay for officers in military employment (officers in civil employment are entitled to higher rates):—After arrival in India, on first appointment, £250 a year; after the commencement of the tenth year's service for pension, £300 a year; after the commencement of the fifteenth year's service for pension, £450 a year; after the commencement of the twentieth year's service for pension, £600 a year; and after the commencement of the twenty-fifth year's service for pension, £700 a year. 3. Leave in India, but for the period of one year only, on full military pay and half the staff salary of appointment. No extension of leave involving absence from duty for more than two years, whether taken in or out of India, can be granted except on specially urgent grounds and without pay. An officer unable on account of the state of his health to return to duty within the maximum period of two years' absence, unless he is specially granted an extension of leave without pay, is placed on temporary half-pay or the retired list, as the circumstances of the case may require. An officer is also liable to be placed on half-pay or the retired list should his health require an undue amount of leave, whether in or out of India. Leave may be granted at any time, but solely at the discretion of the civil or military authorities in India under whom an officer may be serving. Officers of the Administrative grades may be granted one period of leave not exceeding eight months during their tenure of appointment. Extra furlough may be granted to officers desirous of pursuing special courses of study at the rate of one month's furlough for each year's service up to 12 months in all. During such leave the ordinary furlough pay will be given with lodging allowances of 4*s.*, 6*s.*, and 8*s.* a day for Lieutenants, Captains, and field officers respectively. An officer on leave is required to join at once on being recalled to duty unless certified by a medical board *as unfit to do so.*

PAY AND ALLOWANCES.

The rate of pay drawn by Lieutenants of the Indian Medical Service previous to arrival in India is 14*s.* a day, but a Lieutenant (1) who has been permitted by the Secretary of State to hold a hospital appointment will receive no pay while holding it; (2) who is detained by illness in this country will be paid at the rate of £250 a year from the date on which he would otherwise have embarked until the date of embarkation, and at the rate of 14*s.* a day during the voyage to India.

Pay at the above rate is issued in this country up to the date of embarkation, and an advance of two months' pay at the same rate is also made prior to embarkation, which is adjusted in India.

The following are the monthly rates of Indian pay drawn by officers of the Indian Medical Service from the date of their arrival in India:—

Rank.	Unemployed pay.	Grade pay.	Staff pay.	In officiating medical charge of a regiment.	In permanent medical charge of a regiment.
	Rs.	Rs.	Rs.	Rs.	Rs.
Lieutenant	420	350	150	425	500
Captain	475	400	150	475	550
,, after 5 years' service ...	475	450	150	525	600
,, after 7 years' service ...	—	500	150	575	650
,, after 10 years' service ...	—	550	150	625	700
Major	—	650	150	725	800
,, after 15 years' service ...	—	750	150	825	900
Lieutenant-Colonel	—	900	350	1075	1250
,, ,, after 25 years' service ...	—	900	400	1100	1300
,, ,, specially selected for increased pay	—	1000	400	1200	1400

NOTES.—(*a*) Unemployed pay is drawn by officers of less than seven years' service who are not holding officiating or substantive charge of native regiments. Officers of more than seven years' service draw grade pay alone when unemployed. Staff pay is the pay of a command and is drawn in addition to grade pay.

(*b*) Horse allowance is granted to officers in charge of cavalry regiments at the rate of Rs. 90 a month to Lieutenant-Colonels and Majors, and Rs. 60 a month Captains and Lieutenants.

Note to paras. 16 to 20.—Under present arrangements, officers of the Indian Medical Service who are not statutory natives of India receive exchange compensation allowance to compensate them for the fall of the value of the rupee. The allowance consists of an addition to their salaries (subject to certain limitations) equal to half the difference between their salaries converted at (1) 1*s.* 6*d.* the rupee, and (2) the standard Government rate, which has been fixed at 1*s.* 4*d.* the rupee until further notice.

Officers holding the principal administrative appointments and substantive military charges of the Indian Medical Service receive at present the following consolidated salaries:—

	Rs. per mensem.
Colonel, 16 (some in civil employ) from	1800 to 2500
Surgeon-General, 1 @	2200
,, 2 @	2500
,, (the Director-General I.M.S.) 1 @	3000

Specialist pay at the rate of Rs. 60 a mont below
the rank of Lieutenant-Colonel who may be

Qualified officers of the Medical Service
ments in the Assay Department. The sal
are from Rs. 600 to Rs. 2250 per mensem.

Officers are required to perform two years' regimental duty in India before they can be considered eligible for civil employment.

Except in the administrative grades and in certain special appointments officers are not debarred from taking private practice as long as it does not interfere with their proper duties.

POSTS IN CIVIL EMPLOY.

A large number of posts in civil employ are ordinarily filled up from

officers of the Indian Medical Service. Officers are required to perform two years' regimental duty in India before they can be considered eligible for civil employment. The principal appointments, together with the salaries attached to each, are stated in the following table:—

Description of appointment.	Approximate number of appointments in each class.	Salary per mensem. When held by a Lieutenant-Colonel.	When held by a Major.	When held by a Captain.	When held by a Lieutenant.
		Rs.	Rs.	Rs.	Rs.
Inspectors-General of Civil Hospitals	6	2250–2500	—	—	—
Sanitary Commissioner with Government of India	1	2000–2500	—	—	—
Inspectors-General of Prisons	8	1500–2000	—	—	—
Principals of Medical Colleges	2	1650–1800	1200–1300	—	—
Professorial Appointments	23	1500–1650	1050–1150	800–950	750
Sanitary Commissioners ...	6	1500–1800	—	—	—
Deputy Sanitary Commissioners...	13	1350–1500	900–1000	650–800	600
Bacteriological Appointments	5	1500–1600	1050–1150	700–900	650
Superintendents of Central Lunatic Asylums	6	1400–1550	1050–1150	700–900	650
Superintendents of First Class Central Jails	5	1400–1550	950–1050	700–850	650
Superintendents of Second Class Central Jails	5	1300–1450	850–950	600–750	550
Civil Surgeoncies (First Class)	37	1300–1450	850–950	600–750	550
Civil Surgeoncies (Second Class)	171	1200–1350	750–850	500–650	450
Probationary Chemical Examiner	1	—	—	600–750	550

There are also six Chemical Examiners with Rs. 800–1650 per mensem and a number of Port Health Officers with Rs 750–1950 per mensem. Other appointments of Resident Surgeons and Physicians at hospitals, &c., are on salaries ranging from Rs. 700 to 1650 per mensem. There are also a certain number of appointments under the Political Department on salaries ranging from Rs. 450 to 1450 per mensem, exclusive of local allowances.

23. Qualified officers of the Medical Service are also eligible for appointments in the Assay and Mint Departments. The salaries of these appointments are from Rs. 600–2250 per mensem.

TENURE OF OFFICE IN ADMINISTRATIVE GRADES.

The tenure of office of Surgeon-Generals and Colonels is limited to five years. Colonels, if not disqualified by age, are eligible either for employment for a second tour of duty in the same grade or for employment in the higher grade of Surgeon-General by promotion thereto.

Absence on leave in excess of eight months during a five years' tour of duty involves forfeiture of appointment.

Surgeon-Generals and Colonels, on vacating office at the expiration of the five years' tour of duty, are permitted to draw *in India* an unemployed salary of Rs. 1350 per mensem in the former, and Rs. 1000 in the latter case, for a period of six months from the date of their vacating office, after which they are placed while unemployed on the following scale of pay:—

—	Surgeon-General. Per diem.	Colonel. Per diem.
	£ s. d.	£ s. d.
After 30 years' service on full pay	2 5 0	1 14 0
" 25 " " "	2 5 0	1 10 0
" 20 " " " or on promotion, should this period of service not be completed...	2 0 0	1 8 0

A Surgeon-General or Colonel who has completed his term of service and has reverted to British pay may reside in Europe, at the same time qualifying for higher pension.

RETIRING PENSIONS AND HALF-PAY.

Officers of the Indian Medical Service will be allowed to retire on the following scale of pension on completion of the required periods of service:—

After 30 years' service for pension...	£700 per annum + £350 after three years' active employment in India as a Surgeon-General, or + £250 per annum after five years' active employment as a Colonel or £125 after three years as a Colonel. Eight months' absence on leave is allowed to count towards actual service in those grades.
" 25 " " "	£500 per annum.
" 20 " " "	£400 "
" 17 " " "	£300 "

Service for pension reckons from date of first commission and includes all leave taken under the leave rules.

Time (not exceeding one year) passed on temporary half-pay reckons as service for promotion and pension, in the case of an officer placed on half-pay on account of ill-health contracted in the performance of military duty.

Officers of the Indian Medical Service are liable after retirement on pension before completing 30 years' service to recall to military duty in case of any great emergency arising up to 55 years of age.

All officers of the rank of Lieutenant-Colonel and Major are placed on the retired list at the age of 55, and all Surgeons-General and Colonels at the age of 60, but the Director-General is allowed to serve until he has attained the age of 62 years. If a Lieutenant-Colonel has been especially selected for increased pay and he attains the age of 55 years before he becomes entitled to the pension of 30 years' service he may be retained until the completion of such service, and in any special case, where it would appear to be for the good of the Service that an officer should continue in employment, he may be so continued, subject in each case to the sanction of the Secretary of State for India in Council.

Officers placed on temporary or permanent half-pay are granted half-pay at the following rates.

—	Rates of Half-pay.* Per diem.	Per annum.
	£ s. d.	£ s. d.
Under 5 years' service	0 6 0	109 10 0
After 5 "	0 8 0	146 0 0
" 10 "	0 10 0	182 10 0
" 15 "	0 13 6	246 7 6
Lieutenant-Colonel, under 3 years' service as such	1 0 0	365 0 0
Lieutenant-Colonel, over 3 years' service as such	1 7 6	501 17 6

* Officers cannot retire *in India* on half-pay (No. 45, Feb. 28th, 1865).

An officer of less than three years' service, although he may be transferred to the half-pay list under the general conditions of transfer, will not be granted any half-pay unless his unfitness has been caused by service.

INVALID PENSIONS

An officer who has become incapacitated for further service in India on account of unfitness caused by duty may, after he has been two years on temporary half-pay, be granted an Invalid Pension on the following scale:—

	Per annum.
After 16 years' pension service	£272
" 15 " " "	252
" 14 " " "	232
" 13 " " "	212
" 12 " " "	192

WOUND PENSIONS.

Officers are entitled to the same allowances on account of wounds received in action and injuries sustained through the performance of military duty as are granted to combatant officers of His Majesty's Indian Military Forces holding the corresponding military rank.

FAMILY PENSIONS.

The claims to pension of widows and families of officers are treated under the provisions of such Royal Warrant regulating the grant of pensions to the widows and families of British officers as may be in force at the time being.

The widows and families of officers are also entitled to pensions under the Indian Service Family Pension Regulations, for the benefits of which all officers must, as a condition of their appointment, subscribe from the date of their arrival in India, except in the case of natives of India, for whom it is optional.

HONOURS AND REWARDS.

Officers of the Indian Medical Service are eligible for the military distinction of the Order of the Bath and for other Orders, British and Indian, and for good service pensions. Six of the most meritorious officers are named Honorary Physicians and six are named Honorary Surgeons to His Majesty. On appointment as Honorary Physician or Surgeon an officer below the rank of Colonel is promoted to that rank, remaining supernumerary until absorbed. A retired officer appointed Honorary Physician or Surgeon to the King is granted the honorary rank of Colonel, if on retirement he had not attained to that rank.

NOTE.—The following is a list of recognised Civil Hospitals.—England and Wales.—London: St. Bartholomew's Hospital, Charing Cross Hospital, Guy's Hospital, King's College Hospital, London Hospital, Middlesex Hospital, St. George's Hospital, St. Mary's Hospital, St. Thomas's Hospital, University College Hospital, and Westminster Hospital. Birmingham: General Hospital and Queen's Hospital. Bristol: Royal Infirmary and General Hospital. Cambridge: Addenbrooke's Hospital. Cardiff: Cardiff Infirmary. Leeds: General Infirmary. Liverpool: Royal Infirmary and Southern Infirmary. Manchester: Royal Infirmary. Newcastle-on-Tyne: Royal Infirmary. Oxford: Radcliffe Infirmary. Sheffield: Royal Infirmary and Royal Hospital. Scotland.—Aberdeen: Royal Infirmary. Dundee: Royal Infirmary. Edinburgh: Royal Infirmary. Glasgow: Royal Infirmary and Western Infirmary. Ireland.—Belfast: Royal Victoria Hospital. Cork: North Infirmary and South Infirmary. Dublin: the Adelaide Hospital, the City of Dublin Hospital, the Jervis Street Hospital, the Mater Misericordiæ Hospital, the Meath Hospital, Mercer's Hospital, the Richmond, Whitworth, and Hardwicke Hospital, St. Vincent's Hospital, Sir Patrick Dun's Hospital, and Dr. Steeven's Hospital. Galway: The County Hospital and the Union Hospital.

The Royal Army Medical Corps is at the present time, we believe, a contented service, though the Director-General A.M.S. is excluded from the Army Council, before which he will, however, be summoned whenever his advice and specialist knowledge are required. The relationship of the Director-General to the War Council should be direct and

Service and the Royal Army Medical Corps on first arrival in the country. The nature of the diseases to be combated, the social and religious customs and prejudices of the various races, and the limited resources of money and material make large modifications from European methods necessary. Lieutenants of both services are now posted on arrival either to Rawal Pindi, Poona, Lucknow, or Bangalore for one month for this course, which is carried out under the supervision of the senior medical officer and sanitary officer. The instructors are medical officers nominated by the principal medical officer, India, and demonstrations on various subjects have been given by other officers, staff, engineer, and medical. The course consists of demonstrations and inspections in all parts of the lines of British and Indian troops, bazaars, Government dairies, bakeries, slaughter-houses, trade premises of dairymen, bakers, butchers, and aerated water manufacturers and hobies' houses, market and water-supplies, methods of washing clothes, surface drainage, removal and disposal of sewage and refuse, antimalarial measures, disinfection, cantonment hospitals, control of venereal diseases, plague prevention, methods of hospital administration, &c. The officers under instruction thus have an opportunity of learning something of native customs and are encouraged to learn the vernacular, so as to be less dependent upon their subordinates when first put in responsible positions.

A Lieutenant may be promoted to the rank of Captain on completing three years' full-pay service from the date of first commission, but after completing 18 months' service and before promotion to the rank of Captain he will be required to pass an examination in military law and military medical organisation, the result of which may affect his promotion. With reference to the extract from the *Gazette of India*, Medical Department, No. 1047, dated Oct. 24th, 1903, paragraph 4, it is notified that the Government of India has decided that the scope of the examination which lieutenants of the Indian Medical Service will be required to pass after completion of 18 months' service will be as follows: Subject (*h*) Text-books, the relevant portions of the Army Regulations of India, vols. ii. and vi., and the Field Service Departmental Code (Medical). Subhead (*a*) (2): The duties of the subordinate *personnel* of native military hospitals and the preparation of returns and requisitions connected therewith. Subhead (3): The duties of executive medical officers of the Indian Medical Service. Subject (*d*), subhead (2): Indian military law and Indian articles of war as laid down for officers of the Supply and Transport Corps in G.O.C.C. 897 of 1902. One paper will be set in each of subheads (2) and (3) of subject (*h*). The time allowed for each paper will be three hours. The examinations will take place at district headquarters twice annually, on March 1st and Oct. 1st, simultaneously with those for other officers, commencing on Oct. 1st, 1904. The standard required will be for a pass 5 in (*h*) and 5 in law: for special certificate 8 in (*h*) and 8 in law. An officer may present himself for examination in the above subjects either separately or conjointly. The above rules apply only to officers appointed to the Indian Medical Service on or after Jan. 31st, 1900. The names of candidates for examination will be submitted by general officers commanding districts to the Director of Military Education in India so as to reach that officer by Sept. 1st and Feb. 1st annually. Captains are promoted to the rank of Major after 12 years' full-pay service, but this promotion is accelerated by six months in the case of officers who fulfil certain specified conditions. A Major is promoted to Lieutenant-Colonel on completion of of eight years' full-pay service in the rank of Major. All promotions to higher grades are given by selection for ability and merit. In case of distinguished service in the field a medical officer may receive substantive or brevet rank. The ages for compulsory retirement are the same as those for the Royal Army Medical Corps. Officers of the Indian Medical Service below the rank of Colonel may be granted: 1. Privilege leave under such regulations as may from time to time be in force. 2. Leave out of India for no longer period than one year, capable of extension to two years' absence from duty, on the following pay for officers in military employment (officers in civil employment are entitled to higher rates):—After arrival in India, on first appointment, £250 a year; after the commencement of the tenth year's service for pension, £300 a year; after the commencement of the fifteenth year's service for pension, £450 a year; after the commencement of the twentieth year's service for pension, £600 a year; and after the commencement of the twenty-fifth year's service for pension, £700 a year. 3. Leave in India, but for the period of one year only, on full military pay and half the staff salary of appointment. No extension of leave involving absence from duty for more than two years, whether taken in or out of India, can be granted except on specially urgent grounds and without pay. An officer unable on account of the state of his health to return to duty within the maximum period of two years' absence, unless he is specially granted an extension of leave without pay, is placed on temporary half-pay or the retired list, as the circumstances of the case may require. An officer is also liable to be placed on half-pay or the retired list should his health require an undue amount of leave, whether in or out of India. Leave may be granted at any time, but solely at the discretion of the civil or military authorities in India under whom an officer may be serving. Officers of the Administrative grades may be granted one period of leave not exceeding eight months during their tenure of appointment. Extra furlough may be granted to officers desirous of pursuing special courses of study at the rate of one month's furlough for each year's service up to 12 months in all. During such leave the ordinary furlough pay will be given with lodging allowances of 4*s.*, 6*s.*, and 8*s.* a day for Lieutenants, Captains, and field officers respectively. An officer on leave is required to join at once on being recalled to duty unless certified by a medical board as unfit to do so.

PAY AND ALLOWANCES.

The rate of pay drawn by Lieutenants of the Indian Medical Service previous to arrival in India is 14*s.* a day, but a Lieutenant (1) who has been permitted by the Secretary of State to hold a hospital appointment will receive no pay while holding it; (2) who is detained by illness in this country will be paid at the rate of £250 a year from the date on which he would otherwise have embarked until the date of embarkation, and at the rate of 14*s.* a day during the voyage to India.

Pay at the above rate is issued in this country up to the date of embarkation, and an advance of two months' pay at the same rate is also made prior to embarkation, which is adjusted in India.

The following are the monthly rates of Indian pay drawn by officers of the Indian Medical Service from the date of their arrival in India:—

Rank.	Unemployed pay.	Grade pay.	Staff pay.	In officiating medical charge of a regiment.	In permanent medical charge of a regiment.
	Rs.	Rs.	Rs.	Rs.	Rs.
Lieutenant	420	350	150	425	500
Captain	475	400	150	475	550
" after 5 years' service ...	475	450	150	525	600
" after 7 years' service ...	—	500	150	575	650
" after 10 years' service ...	—	550	150	625	700
Major	—	650	150	725	800
" after 15 years' service ...	—	750	150	825	900
Lieutenant-Colonel	—	900	350	1075	1250
" " after 25 years' service ...	—	900	400	1100	1300
" " specially selected for increased pay	—	1000	400	1200	1400

NOTES.—(*a*) Unemployed pay is drawn by officers of less than seven years' service who are not holding officiating or substantive charge of native regiments. Officers of more than seven years' service draw grade pay alone when unemployed. Staff pay is the pay of a command and is drawn in addition to grade pay.

(*b*) Horse allowance is granted to officers in charge of cavalry regiments at the rate of Rs. 90 a month to Lieutenant-Colonels and Majors, and Rs. 60 a month Captains and Lieutenants.

Note to paras. 16 to 20.—Under present arrangements, officers of the Indian Medical Service who are not statutory natives of India receive exchange compensation allowance to compensate them for the fall of the value of the rupee. The allowance consists of an addition to their salaries (subject to certain limitations) equal to half the difference between their salaries converted at (1) 1*s.* 6*d.* the rupee, and (2) the standard Government rate, which has been fixed at 1*s.* 4*d.* the rupee until further notice.

Officers holding the principal administrative appointments and substantive military charges of the Indian Medical Service receive at present the following consolidated salaries:—

	Rs. per mensem.
Colonel, 16 (some in civil employ) from	1800 to 2500
Surgeon-General, 1 @	2200
" 2 @	2500
" (the Director-General I.M.S.) 1 @	3000

Specialist pay at the rate of Rs. 60 a month is granted to officers below the rank of Lieutenant-Colonel who may be appointed to certain posts.

Qualified officers of the Medical Service are also eligible for appointments in the Assay Department. The salaries of these appointments are from Rs. 600 to Rs. 2250 per mensem.

Officers are required to perform two years' regimental duty in India before they can be considered eligible for civil employment.

Except in the administrative grades and in certain special appointments officers are not debarred from taking private practice as long as it does not interfere with their proper duties.

POSTS IN CIVIL EMPLOY.

A large number of posts in civil employ are ordinarily filled up from

officers of the Indian Medical Service. Officers are required to perform two years' regimental duty in India before they can be considered ligible for civil employment. The principal appointments, together ith the salaries attached to each, are stated in the following table:—

Description of appointment.	Approximate number of appointments in each class.	Salary per mensem.			
		When held by a Lieutenant-Colonel.	When held by a Major.	When held by a Captain.	When held by a Lieutenant.
		Rs.	Rs.	Rs.	Rs.
Inspectors-General of Civil Hospitals	6	2250–2500	—	—	—
Sanitary Commissioner with Government of India	1	2000–2500	—	—	—
Inspectors-General of Prisons	8	1500–2000	—	—	—
Principals of Medical Colleges	2	1650–1800	1200–1300	—	—
Professorial Appointments	23	1500–1650	1050–1150	800–950	750
Sanitary Commissioners ...	6	1500–1800	—	—	—
Deputy Sanitary Commissioners...	13	1350–1500	900–1000	650–800	600
Bacteriological Appointments	5	1500–1600	1050–1150	700–900	650
Superintendents of Central Lunatic Asylums	6	1400–1550	1050–1150	700–900	650
Superintendents of First Class Central Jails	5	1400–1550	950–1050	700–850	650
Superintendents of Second Class Central Jails	5	1300–1450	850–950	600–750	550
Civil Surgeoncies (First Class)	37	1300–1450	850–950	600–750	550
Civil Surgeoncies (Second Class)	171	1200–1350	750–850	500–650	450
Probationary Chemical Examiner	1	—	—	600–750	550

There are also six Chemical Examiners with Rs. 800–1650 per mensem and a number of Port Health Officers with Rs. 750–1950 per mensem. Other appointments of Resident Surgeons and Physicians at hospitals, &c., are on salaries ranging from Rs. 700 to 1650 per mensem. There are also a certain number of appointments under the Political Department on salaries ranging from Rs. 450 to 1450 per mensem, exclusive of local allowances.

23. Qualified officers of the Medical Service are also eligible for appointments in the Assay and Mint Departments. The salaries of these appointments are from Rs. 600–2250 per mensem.

Tenure of Office in Administrative Grades.

The tenure of office of Surgeon-Generals and Colonels is limited to five years. Colonels, if not disqualified by age, are eligible either for employment for a second tour of duty in the same grade or for employment in the higher grade of Surgeon-General by promotion thereto.

Absence on leave in excess of eight months during a five years' tour of duty involves forfeiture of appointment.

Surgeon-Generals and Colonels, on vacating office at the expiration of the five years' tour of duty, are permitted to draw *in India* an unemployed salary of Rs. 1350 per mensem in the former, and Rs. 1000 in the latter case, for a period of six months from the date of their vacating office, after which they are placed while unemployed on the following scale of pay:—

—	Surgeon-General. Per diem.	Colonel. Per diem.
	£ *s.* *d.*	£ *s.* *d.*
After 30 years' service on full pay	2 5 0	1 14 0
,, 25 ,, ,, ,, ...	2 5 0	1 10 0
,, 20 ,, ,, ,, or on promotion, should this period of service not be completed...	2 0 0	1 8 0

A S[illegible] Colonel who has completed his term of service [illegible] pay may reside in Europe, at the same time [illegible] ion.

Retiring Pensions and Half-pay.

Officers of the Indian Medical Service will be allowed to retire on the following scale of pension on completion of the required periods of service:—

After 30 years' service for pension ...	£700 per annum + £350 after three years' active employment in India as a Surgeon-General, or + £250 per annum after five years' active employment as a Colonel or £125 after three years as a Colonel. Eight months' absence on leave is allowed to count towards actual service in those grades.
,, 25 ,, ,, ,,	£500 per annum.
,, 20 ,, ,, ,,	£400 ,,
,, 17 ,, ,, ,,	£300 ,,

Service for pension reckons from date of first commission and includes all leave taken under the leave rules.

Time (not exceeding one year) passed on temporary half-pay reckons as service for promotion and pension, in the case of an officer placed on half-pay on account of ill-health contracted in the performance of military duty.

Officers of the Indian Medical Service are liable after retirement on pension before completing 30 years' service to recall to military duty in case of any great emergency arising up to 55 years of age.

All officers of the rank of Lieutenant-Colonel and Major are placed on the retired list at the age of 55, and all Surgeons-General and Colonels at the age of 60, but the Director-General is allowed to serve until he has attained the age of 62 years. If a Lieutenant-Colonel has been especially selected for increased pay and he attains the age of 55 years before he becomes entitled to the pension of 30 years' service he may be retained until the completion of such service, and in any special case, where it would appear to be for the good of the Service that an officer should continue in employment, he may be so continued, subject in each case to the sanction of the Secretary of State for India in Council.

Officers placed on temporary or permanent half-pay are granted half-pay at the following rates.

—	Rates of Half-pay.*	
	Per diem.	Per annum.
	£ *s.* *d.*	£ *s.* *d.*
Under 5 years' service	0 6 0	109 10 0
After 5 ,, ...	0 8 0	146 0 0
,, 10 ,, ...	0 10 0	182 10 0
,, 15 ,, ...	0 13 6	246 7 6
Lieutenant-Colonel, under 3 years' service as such	1 0 0	365 0 0
Lieutenant-Colonel, over 3 years' service as such	1 7 6	501 17 6

* Officers cannot retire *in India* on half-pay (No. 45, Feb. 28th, 1865).

An officer of less than three years' service, although he may be transferred to the half-pay list under the general conditions of transfer, will not be granted any half-pay unless his unfitness has been caused by service.

Invalid Pensions.

An officer who has become incapacitated for further service in India on account of unfitness caused by duty may, after he has been two years on temporary half-pay, be granted an Invalid Pension on the following scale:—

	Per annum.
After 16 years' pension service	£272
,, 15 ,, ,, ,, ...	252
,, 14 ,, ,, ,, ...	232
,, 13 ,, ,, ,, ...	212
,, 12 ,, ,, ,, ...	192

Wound Pensions.

Officers are entitled to the same allowances on account of wounds received in action and injuries sustained through the performance of military duty as are granted to combatant officers of His Majesty's Indian Military Forces holding the corresponding military rank.

Family Pensions.

The claims to pension of widows and families of officers are treated under the provisions of such Royal Warrant regulating the grant of pensions to the widows and families of British officers as may be in force at the time being.

The widows and families of officers are also entitled to pensions under the Indian Service Family Pension Regulations, for the benefits of which all officers must, as a condition of their appointment, subscribe from the date of their arrival in India, except in the case of natives of India, for whom it is optional.

Honours and Rewards.

Officers of the Indian Medical Service are eligible for the military distinction of the Order of the Bath and for other Orders, British and Indian, and for good service pensions. Six of the most meritorious officers are named Honorary Physicians and six are named Honorary Surgeons to His Majesty. On appointment as Honorary Physician or Surgeon an officer below the rank of Colonel is promoted to that rank, remaining supernumerary until absorbed. A retired officer appointed Honorary Physician or Surgeon to the King is granted the honorary rank of Colonel, if on retirement he had not attained to that rank.

Note.—The following is a list of recognised Civil Hospitals.—England and Wales.—London: St. Bartholomew's Hospital, Charing Cross Hospital, Guy's Hospital, King's College Hospital, London Hospital, Middlesex Hospital, St. George's Hospital, St. Mary's Hospital, St. Thomas's Hospital, University College Hospital, and Westminster Hospital. Birmingham: General Hospital and Queen's Hospital. Bristol: Royal Infirmary and General Hospital. Cambridge: Addenbrooke's Hospital. Cardiff: Cardiff Infirmary. Leeds: General Infirmary. Liverpool: Royal Infirmary and Southern Infirmary. Manchester: Royal Infirmary. Newcastle-on-Tyne: Royal Infirmary. Oxford: Radcliffe Infirmary. Sheffield: Royal Infirmary and Royal Hospital. Scotland.—Aberdeen: Royal Infirmary. Dundee: Royal Infirmary. Edinburgh: Royal Infirmary. Glasgow: Royal Infirmary and Western Infirmary. Ireland.—Belfast: Royal Victoria Hospital. Cork: North Infirmary and South Infirmary. Dublin: the Adelaide Hospital, the City of Dublin Hospital, the Jervis Street Hospital, the Mater Misericordiæ Hospital, the Meath Hospital, Mercer's Hospital, the Richmond, Whitworth, and Hardwicke Hospital, St. Vincent's Hospital, Sir Patrick Dun's Hospital, and Dr. Steeven's Hospital. Galway: The County Hospital and the Union Hospital.

The Royal Army Medical Corps is at the present time, we believe, a contented service, though the Director-General A.M.S. is excluded from the Army Council, before which he will, however, be summoned whenever his advice and specialist knowledge are required. The relationship of the Director-General to the War Council should be direct and

Service and the Royal Army Medical Corps on first arrival in the country. The nature of the diseases to be combated, the social and religious customs and prejudices of the various races, and the limited resources of money and material make large modifications from European methods necessary. Lieutenants of both services are now posted on arrival either to Rawal Pindi, Poona, Lucknow, or Bangalore for one month for this course, which is carried out under the supervision of the senior medical officer and sanitary officer. The instructors are medical officers nominated by the principal medical officer, India, and demonstrations on various subjects have been given by other officers, staff, engineer, and medical. The course consists of demonstrations and inspections in all parts of the lines of British and Indian troops, bazaars, Government dairies, bakeries, slaughter-houses, trade premises of dairymen, bakers, butchers, and aerated water manufacturers and hobies' houses, market and water-supplies, methods of washing clothes, surface drainage, removal and disposal of sewage and refuse, antimalarial measures, disinfection, cantonment hospitals, control of venereal diseases, plague prevention, methods of hospital administration, &c. The officers under instruction thus have an opportunity of learning something of native customs and are encouraged to learn the vernacular, so as to be less dependent upon their subordinates when first put in responsible positions.

A Lieutenant may be promoted to the rank of Captain on completing three years' full-pay service from the date of first commission, but after completing 18 months' service and before promotion to the rank of Captain he will be required to pass an examination in military law and military medical organisation, the result of which may affect his promotion. With reference to the extract from the *Gazette of India*, Medical Department, No. 1047, dated Oct. 24th, 1903, paragraph 4, it is notified that the Government of India has decided that the scope of the examination which lieutenants of the Indian Medical Service will be required to pass after completion of 18 months' service will be as follows: Subject (*h*) Text-books, the relevant portions of the Army Regulations of India, vols. ii. and vi., and the Field Service Departmental Code (Medical). Subhead (*a*) (2): The duties of the subordinate *personnel* of native military hospitals and the preparation of returns and requisitions connected therewith. Subhead (3): The duties of executive medical officers of the Indian Medical Service. Subject (*d*), subhead (2): Indian military law and Indian articles of war as laid down for officers of the Supply and Transport Corps in G.O.C.C. 897 of 1902. One paper will be set in each of subheads (2) and (3) of subject (*h*). The time allowed for each paper will be three hours. The examinations will take place at district headquarters twice annually, on March 1st and Oct. 1st, simultaneously with those for other officers, commencing on Oct. 1st, 1904. The standard required will be for a pass 5 in (*h*) and 5 in law: for special certificate 8 in (*h*) and 8 in law. An officer may present himself for examination in the above subjects either separately or conjointly. The above rules apply only to officers appointed to the Indian Medical Service on or after Jan. 31st, 1900. The names of candidates for examination will be submitted by general officers commanding districts to the Director of Military Education in India so as to reach that officer by Sept. 1st and Feb. 1st annually. Captains are promoted to the rank of Major after 12 years' full-pay service, but this promotion is accelerated by six months in the case of officers who fulfil certain specified conditions. A Major is promoted to Lieutenant-Colonel on completion of of eight years' full-pay service in the rank of Major. All promotions to higher grades are given by selection for ability and merit. In case of distinguished service in the field a medical officer may receive substantive or brevet rank. The ages for compulsory retirement are the same as those for the Royal Army Medical Corps. Officers of the Indian Medical Service below the rank of Colonel may be granted: 1. Privilege leave under such regulations as may from time to time be in force. 2. Leave out of India for no longer period than one year, capable of extension to two years' absence from duty, on the following pay for officers in military employment (officers in civil employment are entitled to higher rates):—After arrival in India, on first appointment, £250 a year; after the commencement of the tenth year's service for pension, £300 a year; after the commencement of the fifteenth year's service for pension, £450 a year; after the commencement of the twentieth year's service for pension, £600 a year; and after the commencement of the twenty-fifth year's service for pension, £700 a year. 3. Leave in India, but for the period of one year only, on full military pay and half the staff salary of appointment. No extension of leave involving absence from duty for more than two years, whether taken in or out of India, can be granted except on specially urgent grounds and without pay. An officer unable on account of the state of his health to return to duty within the maximum period of two years' absence, unless he is specially granted an extension of leave without pay, is placed on temporary half-pay or the retired list, as the circumstances of the case may require. An officer is also liable to be placed on half-pay or the retired list should his health require an undue amount of leave, whether in or out of India. Leave may be granted at any time, but solely at the discretion of the civil or military authorities in India under whom an officer may be serving. Officers of the Administrative grades may be granted one period of leave not exceeding eight months during their tenure of appointment. Extra furlough may be granted to officers desirous of pursuing special courses of study at the rate of one month's furlough for each year's service up to 12 months in all. During such leave the ordinary furlough pay will be given with lodging allowances of 4*s*., 6*s*., and 8*s*. a day for Lieutenants, Captains, and field officers respectively. An officer on leave is required to join at once on being recalled to duty unless certified by a medical board as unfit to do so.

PAY AND ALLOWANCES.

The rate of pay drawn by Lieutenants of the Indian Medical Service previous to arrival in India is 14*s*. a day, but a Lieutenant (*l*) who has [illegible] hospital appoint- [illegible] tained by illness [illegible] from the date on [illegible] of embarkation, and at the rate of 14*s*. a day during the voyage to India.

Pay at the above rate is issued in this country up to the date of embarkation, and an advance of two months' pay at the same rate is also made prior to embarkation, which is adjusted in India.

The following are the monthly rates of Indian pay drawn by officers of the Indian Medical Service from the date of their arrival in India:—

Rank.	Unemployed pay.	Grade pay.	Staff pay.	In officiating medical charge of a regiment.	In permanent medical charge of a regiment.
	Rs.	Rs.	Rs.	Rs.	Rs.
Lieutenant	420	350	150	425	500
Captain	475	400	150	475	550
" after 5 years' service ...	475	450	150	525	600
" after 7 years' service ...	—	500	150	575	650
" after 10 years' service ...	—	550	150	625	700
Major	—	650	150	725	800
" after 15 years' service ...	—	750	150	825	900
Lieutenant-Colonel	—	900	350	1075	1250
" " after 25 years' service ...	—	900	400	1100	1300
" " specially selected for increased pay	—	1000	400	1200	1400

NOTES.—(*a*) Unemployed pay is drawn by officers of less than seven years' service who are not holding officiating or substantive charge of native regiments. Officers of more than seven years' service draw grade pay alone when unemployed. Staff pay is the pay of a command [illegible] officers in charge of cavalry regi- [illegible] Lieutenant-Colonels and Majors, and Rs. 60 a month Captains and Lieutenants.

Note to paras. 16 to 20.—Under present arrangements, officers of the Indian Medical Service who are not statutory natives of India receive exchange compensation allowance to compensate them for the fall of the value of the rupee. The allowance consists of an addition to their salaries (subject to certain limitations) equal to half the difference between their salaries converted at (1) 1*s*. 6*d*. the rupee, and (2) the standard Government rate, which has been fixed at 1*s*. 4*d*. the rupee until further notice.

Officers holding the principal administrative appointments and substantive military charges of the Indian Medical Service receive at present the following consolidated salaries:—

	Rs. per mensem.
Colonel, 16 (some in civil employ) from	1800 to 2500
Surgeon-General, 1 @	2200
" 2 @	2500
" (the Director-General I.M.S.) 1 @	3000

Specialist pay at the rate of Rs. 60 a month is granted to officers below the rank of Lieutenant-Colonel [illegible] to certain posts.

Qualified officers of the Medi[illegible] appoint- [illegible] ments in the Assay Department. [illegible] are from Rs. 600 to Rs. 2250 per mensem.

Officers are required to perform two years' regimental duty in India before they can be considered eligible for civil employment.

Except in the administrative grades and in certain special appointments officers are not debarred from taking private practice as long as it does not interfere with their proper duties.

POSTS IN CIVIL EMPLOY.

A large number of posts in civil employ are ordinarily filled up from

personal. The limitation of the number of lieutenant-colonels has, of course, affected adversely some officers who are well worthy of promotion to the highest ranks, and we look to the Director-General to arrange that really deserving officers may not suffer through the introduction of a regulation which would rob the service of officers who have done some of the best work for the Royal Army Medical Corps.

The blots on the present regulations for the Indian Medical Service are as follows :—

1. That no officer, however employed, can receive any staff allowance unless he has passed the lower standard examination in Hindustani.

2. That an officer who enters the service after his 25th birthday forfeits almost to a certainty his chance of ever reaching a higher pension than £500 per annum.

3. The order of the present Government of India that an officer of the Indian Medical Service must refer the question of the amount of his fees when above a certain low limit to the civil authority. The recent orders might necessitate the violation of professional secrecy.

4. The neglect of the rule that the office of principal medical officer to His Majesty's forces may be held by an officer of the Indian Medical Service.

SPECIALIST PAY FOR OFFICERS OF THE ROYAL ARMY MEDICAL CORPS AND INDIAN MEDICAL SERVICE IN INDIA.

The Government of India has just approved of revised rules in connexion with specialist appointments in India. 55 of '' will be allotted to the Royal Army Medical Corps anc Medical Service in military employment The Speci month) is an allowance to officers below the rank of Lieutenant-Colonel for special sanitary, surgical, or medical work done for the State. The following is a list of appointments :—

	Rs.
(a) Prevention of disease (including parasitology, bacteriology, and preventive inoculation	40
(b) Dermatology (including the prophylaxis, treatment of, and instructional measures in connexion with, venereal diseases)	10
(c) Advanced operative surgery	20
(d) Ophthalmology	10
(e) Electrical science (including skiagraphy)	10
(f) Mental science	2
(g) Otology, laryngology, and rhinology	3
(h) Midwifery and diseases of women and children ...	10

Selections for appointments and the distribution throughout the several divisions and brigades will be made under the orders of His Excellency the Commander-in-Chief, the guiding principle, however, being that *officers will be located in those stations where their services* are likely to be of the greatest utility to the army.

It does not appear probable to us that the above rules will attract many men to the rank of the so-called specialist or that the Government can regard with much esteem a status for which it can frame such regulations.

PUBLIC HEALTH.

INSTRUCTION FOR DIPLOMAS IN STATE MEDICINE.

THE following resolutions, designed with a view of ensuring "the possession of a distinctively high proficiency, scientific and practical, in all the branches of study which concern the public health," were adopted by the General Medical Council from 1902 to 1905. The regulations require that—"(1) A period of not less than twelve months shall elapse between the attainment of a registrable qualification in Medicine, Surgery, and Midwifery and the examination for a diploma in Sanitary Science, Public Health or State Medicine; (2) every candidate shall produce evidence of having attended, after obtaining a registrable qualification, during a period of six months, practical instruction in a laboratory, British or foreign, approved of by the body granting the diploma and in which chemistry, bacteriology, and the pathology of diseases of animals transmissible to man are taught; (3) every candidate shall produce evidence that, after having obtained a registrable qualification, he has for six months (of which at least three months shall be distinct and separate from the period of laboratory instruction) practically studied the duties, routine and special, of Public Health administration either under a whole-time medical officer of health or a medical officer of health who is also a teacher in public health in a recognised school, or in England and Wales under the medical officer of health of a county or of a single sanitary district of 50,000, or in one or more districts of 30,000 in Scotland or Ireland, or under a sanitary staff officer of the Royal Army Medical Corps having charge of an army corps, district, or command recognised by the General Medical Council, provided that the six months may be reduced to three if a candidate produces evidence that after obtaining a registrable qualification he has for three months attended a course of recognised instruction in sanitary law, sanitary engineering, vital statistics, and other subjects bearing on Public Health administration; (4) every candidate shall produce evidence that after having obtained a registrable qualification he has attended *during* three months the practice of a hospital for infectious diseases at which opportunities are afforded for the study of methods of administration; (5) the examination shall have been conducted by examiners specially qualified, and shall comprise laboratory work as well as written and oral examination; (6) the rules as to study shall not apply to medical practitioners registered, or entitled to be registered, on or before Jan. 1st, 1890." It was enacted by Section 18 (2) of the Local Government Act [England and Wales], 1888, that after Jan. 1st, 1892, no such appointment (that of medical officer of health) may be made in any county, or in any district or combination of districts with a population of 50,000 or upwards, *unless the officer—having, of course, qualifications* in Medicine, Surgery, and Midwifery—is registered as the holder of a diploma in Sanitary Science, Public Health, or State Medicine under Section 21 of the Medical Act, 1886, or has during any three consecutive years pre- 1892 been medical officer of a district or combina- f districts with a population of 20,000 at least, or has for three years previously to August 13th, 1888, been a medical officer or inspector of the Local Government Board With the sanction of the Local Government Board the same person may be appointed medical officer for two or more districts.

The regulations in question as to study may be procured at the office of the General Medical Council in London.

University of London.—Sanitary Science is included under the head of State Medicine in the M.D. degree, and a certificate *has to be produced showing* that a course of practical instruction has been attended for the prescribed period, and *that* the course has *included such* chemical, microscopical, and meteorological work and exercises as more especially relate to sanitation. The attendance includes six months' practical instruction in a laboratory and six months' instruction in public health administration under the supervision of a medical officer of health, and three months' attendance on the practice of a hospital for infectious diseases.

University of Oxford.—An examination, conducted partly in writing, *partly vivâ voce, and in each* subject partly practical, is held in Michaelmas Term in the following subjects :—*General Hygiene, General* Pathology (with special relation to Infectious Diseases), the Laws relating to Public Health, Sanitary Engineering, Vital Statistics. The examination is in two parts, which may be taken together or separately; but Part I. must be passed either before, or at the same examination as Part II. The fee for admission to the examination is £5 for each part. Successful candidates are entitled to receive the Diploma in Public Health. Any person whose name is on the Medical Register is admissible as a candidate for this examination provided (1) a period of not less than twelve months shall have elapsed between *the* attainment of *registrable* qualification and the time when he presents himself for either part of the examination; (2) he *produce* evidence of having, after obtaining a registrable qualification, attended during *three months* the *practice of a hospital* for infectious diseases at which opportunities are afforded for the study *of methods of* administration; (3) he produce evidence of having, after obtaining a registrable qualification, *attended during* a period *of six months on one* or more courses, approved by the Syndicate, of practical laboratory instruction in Chemistry, *Bacteriology, and the Pathology* of those diseases of animals that are transmissible to man; and (4) he produce evidence of *having, after obtaining* a registrable qualification, for *six* months (of which at least three months shall be distinct and *separate from the period* of laboratory instruction) been associated day by day in the duty, routine and special, of *public health administration* under the supervision of: (*a*) in England and Wales either the medical officer of health *of* a county or of a *single* sanitary district having a population of not less than 50,000 or a medical officer of health *devoting* his whole *time to*

Guy's Hospital; Samuel Lewis Trevithan, Middlesex and National Dental Hospitals; John Eric Wheeler, Charing Cross and Royal Dental Hospitals; and William Frederick White [illegible], Guy's Hospital.

FOREIGN UNIVERSITY INTELLIGENCE.—*Baltimore (Johns Hopkins University)*: Dr. Joseph T. Smith has been appointed to the chair of Midwifery.—*Cincinnati*: Dr. Archibald Carson has been appointed Professor of Anatomy in succession to Dr. Oliver V. Holt.—*Cleveland (Western Reserve University)*: Dr. Hadley W. Blackmann has been appointed Lecturer on Histology.—*Jena*: The present professor of zoology, Dr. Ernst Haeckel, is resigning the chair which he has held for more than 40 years. He is making over to the university on the occasion of the 350th anniversary of its foundation his unique "Phylogenetic Museum." The collection of the materials for it has been his [illegible] and he proposes to employ his leisure after his retirement in completing it. The professorship is to be offered to Professor Lang of Zürich.—*Kharkoff*: Dr. V. Voskresenski has been promoted to the chair of Operative Medicine.—*Kiel*: The title of Professor has been granted to Dr. H. Piper, privat-docent of Physiology.—*Munich*: Dr. John Seemann, formerly of Giessen, has been recognised as privat-docent of Physiology.—*Nantes*: Dr. M. Duran, Professor of Therapeutics, has been transferred at his own request to the chair of Hygiene and Forensic Medicine in place of Dr. Mirallié.—*Odessa*: Dr. V. [illegible] of Moscow has been appointed Extraordinary Professor of General Pathology.—*Paris*: Dr. Unna of Hamburg and Dr. Pick of Prague have been elected foreign corresponding members of the Academy of Medicine. Dr Quénu, Professor of Surgical Operations and Appliances, has been transferred by his own request to the chair of Clinical Surgery and has been elected a member of the Academy of Medicine.—*Prague (Bohemian University)*: The title of Extraordinary Professor has been granted to Dr. Karl Svehla, privat-docent of Children's Diseases, and to Dr. Wenzel Mayr, privat-docent of Ophthalmology. *German University*: Dr. Karl Kreibich, Extraordinary Professor of Dermatology, has been promoted to an Ordinary Professorship.—*St. Petersburg (Women's Medical Institute)*: Dr. L. T. Levin has been recognised as privat-docent of Laryngology and Otology.—*Vienna*: The College of Professors has at last decided to fill up the chair to which the Third Medical Clinic is attached, which has been vacant since the death of Professor Nothnagel. Although several of the members were very anxious to obtain a colleague of Austrian nationality—such as Dr. von Jaksch of Prague, Dr. Ortner of Innsbruck, Dr. Chvostek or Dr. Pal of Vienna, whose names have been proposed—the final choice has fallen upon a non-Austrian, Dr. Adolf von Strümpell, now Professor of Medicine in the University of Breslau, who has accepted the invitation. He will not, however, take up his new duties until after the conclusion of the winter semester. At the Jubilee Hospital Dr. Linsmayer has been appointed Director, Dr. Paponac Director of the Surgical Department, and Dr. Maresch Prosector. Dr. Rudolf Maresch has been recognised as privat-docent of Pathological Anatomy.

INFRINGING THE PHARMACY ACT.—The Council of the Pharmaceutical Society of Great Britain proceeded against Mrs. R. J. Johnson, of High-street, Selsey, in the Chichester county court, on Dec. 8th, for an infringement of the Pharmacy Act. Mrs. Johnson traded under the name of "R. J. Johnson and Sons, photographic and dispensing chemists," while on the fanlight of her shop was "Roberts, Drug Stores." On Sept. 14th threepennyworth of paregoric was purchased and on being analysed was found to contain one grain of opium. The defendant was thus liable under the provisions of the Pharmacy Act, and, moreover, she was not registered as a member of the Pharmaceutical Society. The defence was that only a technical offence had been committed, that Mrs. Johnson did at one time employ a properly qualified chemist, but that latterly she had arranged with a gentleman living at Selsey to do her dispensing, not realising that by so doing she was infringing the law. The Pharmacy Act, however, is very clear: the person controlling the business, it says, must be duly qualified. His honour Judge Scully, in giving judgment for the Pharmaceutical Society for the amount claimed, namely £10—£5 for having kept open a shop for retailing, dispensing, or compounding a poison, and £5 for taking, using, and exhibiting the title of chemist, contrary to the provisions of the Pharmacy Act—said that the mischief which the Act was intended to remedy was very serious indeed, for it was a most dangerous thing to allow anyone who was not qualified to sell poisons which were often sold in the form of an elixir, mostly intended for the use of children. His honour allowed costs on the higher scale on the ground that the case was one of general public importance.

LONDON HOSPITAL MEDICAL CLUB.—The annual meeting of this club was held at the Café Royal on Dec. 11th. Dr. F. J. Smith, physician to the hospital, occupied the chair at the dinner which followed. The speeches were few and short and several of the guests favoured the company with music, songs, and short stories. The club is one of the oldest of the medical clubs in the metropolis and has now a benevolent fund in connexion with it.

LIVINGSTONE COLLEGE.—The annual report and statement of accounts, which were presented at the annual general meeting of the members of Livingstone College on Dec. 8th, were of a very satisfactory nature. Livingstone College gives elementary medical training to missionaries without reference to denominational or national prejudice. The number of students who entered during the past year is by far the largest on record, being an average of 30 for each of the three terms. The financial statement is particularly satisfactory, the year commencing with a deficiency of £444, which has all been paid off with the exception of £28, and in addition to the ordinary receipts a legacy of £50 has been placed to the capital account. The working expenses of the year have been practically met by the fees of students. Contributions are, however, still needed for the general fund or to pay off the mortgage of £2500 which still exists upon the property. Contributions will be gratefully acknowledged by the Principal, Dr. C. F. Harford, Livingstone College, Leyton, E.

MEDICAL AND DENTAL DEFENCE UNION OF SCOTLAND (LIMITED).—The annual general meeting of the union was held in Glasgow on Nov. 5th in the registered office. Sir Hector C. Cameron (Glasgow) occupied the chair and there was a large attendance of members. In moving the adoption of the annual report and statement of accounts the chairman remarked that the accounts disclosed more marked progress than in any previous year. He referred to the statement submitted by the council that a large proportion of threatened actions on being taken up by the union were departed from, and expressed the view that this illustrated the benefit of such an association. He pointed out that the number of claims against dentists by dissatisfied patients was more in proportion to relative numbers than in the case of medical men. The membership at the close of the previous year was 958, and 240 new members were admitted during the year under review, being an increase of one-fourth. The union had invested funds amounting to £1234 and the income for the year was £553, with an expenditure of only £270. Reference was made to the printed forms issued by the union for the use of practitioners, being an indemnity form to be granted by friends of patients in respect of lunacy certificates and an agreement for use between a practitioner and his assistant. The chairman commented upon the usefulness of these documents to members of the professions interested. Dr. J. Crawford Renton seconded the adoption of the report and statement of accounts and this was unanimously agreed to. Sir A. R. Simpson (Edinburgh), Professor W. Stephenson (Aberdeen), Sir Hector Cameron (Glasgow), and Professor J. A. C. Kynoch (Dundee), were re-elected presidents of the union, and a number of medical and dental practitioners were re-elected as vice-presidents. Dr. John Gordon (Aberdeen), Professor Kynoch, and Dr. G. Balfour Marshall (Glasgow) were unanimously re-elected as members of the general council. The present auditors were re-elected and the meeting closed with a vote of thanks to the chairman. The sixth annual report of the union prints a number of illustrative cases showing the varied manner in which advice and legal assistance have been afforded to its members. The value of such societies is shown in one sentence of this report, "but of the large number of cases presented to the council, involving the

was shown in recent years by his vigorous opposition to the "fish hypothesis" of Sir Jonathan Hutchinson. The absolute non-existence of the disease in Catholic Ireland, along the borders of which badly kept and badly cooked fish are so largely consumed, gave him a strong weapon of controversy ready to hand. His general and specialised activities were shown by work as physician to the Dublin Throat and Ear Hospital, and papers on Lesions of the Throat in Leprosy and Tuberculous Laryngitis. He was an ex-vice-president of the British Laryngological Society and his high attainments in general culture procured his election to membership of the Royal Irish Academy—a body which severely scrutinises the attainments of medical men. Mr. Hillis was twice married and leaves a widow (and two families) to deplore their loss.

HUGH MAYER MONTGOMERIE, M.D., C.M. EDIN.,

SENIOR PHYSICIAN, WEST CORNWALL DISPENSARY AND INFIRMARY, PENZANCE.

Dr. Hugh Mayer Montgomerie died at his residence, 5, Clarence-place, Penzance, on Dec. 12th, from angina pectoris in his forty-fifth year. The deceased was the only son of Dr. James Barclay Montgomerie and was educated at Winchester School. He received his medical education at the University of Edinburgh, graduating M.B. and C.M. in 1887, and two years later he obtained the M.D. He also studied at St. Bartholomew's Hospital, London, and at Vienna, Prague, and Paris. Dr. Montgomerie shortly after graduating commenced practice at Penzance and was elected on the honorary staff of the West Cornwall Dispensary and Infirmary, following his grandfather and father, who were both members of the honorary medical staff of that institution. He was sole physician to the dispensary for 19 years and since the rebuilding of the institution he has been the senior physician. Dr. Montgomerie was a member of the Penzance Antiquarian Society, being the secretary from 1897 to 1900, and he became President the following year. In 1898 he was the President of the South-Western Branch of the British Medical Association. He was a good sportsman, a great football player in his younger days, and at one time he was an all-the-year-round bather. Dr. Montgomerie was extremely popular and highly respected in Penzance and the news of his sudden death was received with sincere regret by all classes, but particularly by the poor to whom he was most generous. The greatest sympathy is felt in Penzance and the district with his aged father and mother.

JAMES HARRISON, M.R.C.S. ENG., L.R.C.P. EDIN.

THE death occurred at East Grinstead, Sussex, on Dec. 13th, after an illness extending over a few days only, of Mr. James Harrison, Warden of Sackville College, to which he was appointed in 1893. Educated at Rossall School, the Owens College, the London Hospital, and Edinburgh, he took the L.R.C.P. Edin. diploma in 1881, and in the same year became M.R.C.S. Eng. For a time he was senior house surgeon at the Manchester Royal Infirmary and proceeded from there to Devonport, where he was for a number of years medical attendant to His Royal Highness the Duke of Edinburgh and his household and also assistant surgeon at the Royal Albert Hospital, Devonport. He was also a Fellow of the Royal Institute of Public Health. At East Grinstead Mr. Harrison was very popular. He held a large number of public appointments, including the post of medical officer of the High Grove Sanatorium, while his private practice not only in the town but in a large area around was a large one. His demise at a comparatively early age is deeply regretted. He was a prominent Freemason, having been Worshipful Master of the Sackville Lodge at East Grinstead in 1900, and was given provincial honours four years later.

DEATHS OF EMINENT FOREIGN MEDICAL MEN.—The deaths of the following eminent foreign medical men are announced:—Dr. Geisthövel, chief of the Franciscus Hospital, from blood poisoning contracted in the course of his duties.—Dr. B. L. Billet, formerly *medecin-inspecteur* in the French Military Medical Service.—Dr. M. N. Popoff, professor of nervous and mental diseases in the University of Tomsk.—Dr. D. I. Kurayeff, extraordinary professor of medical chemistry in the University of Kharkoff.—Dr. Béla Weiss of Vienna, an author of considerable repute in literary circles and formerly editor of the *Wiener Medi Presse*, aged 70 years.—Dr. Dudon, formerly surgeon Bordeaux hospitals.

Medical News.

ROYAL COLLEGE OF SURGEONS OF ENGLA

At an ordinary meeting of the Council of the Royal C of Surgeons on Dec. 10th the diploma of Fellow conferred upon 28 gentlemen who passed the Final mination which was held on Nov. 20th, 23rd, 24th, 26th, and 27th and for which 68 candidates presented selves. The following are the names of the successful didates:—

Hermann Balean, M.D., B.S. Lond., L.R.C.P., M.R.C.S., L
Hospital; John McCallum Anderson Macmillan, Captain I
M.B. Edin., L.R.C.P., M.R.C.S., Edinburgh University an
Bartholomew's Hospital; Robert Ainslie Ross, M.B., Ch.B. E
L.R.C.P., M.R.C.S., Edinburgh University and St. Thomas's
pital; William Haywood Hamilton, Captain I.M.S., L.R.C
M.R.C.S., St. Bartholomew's Hospital; Athelstan Jasper Blaxla
M.B.,
pital; .C.S., University College
M.R.C. , M.B., B.C. Cantab., L.R.C
pital; and St. Bartholomew's
L.R.C. Coventon, M.A., B.C. Cant
University and St. Bartholome
Hospital; William Harold Hey, M.B., Ch.B. Vict., *L.R.C.P.*, *M.R.C.*
Manchester University; Charles William Menelaus Hope, M.
B.S. Durh., L.R.C.P., M.R.C.S., Durham University and
Bartholomew's Hospital; James Elrick Adler, L.R.C.P., M.R.C.
London Hospital; Walter Welchman, M.B., B.S. Lond., L.R.C.
M.R.C.S., Guy's Hospital;

Stephen Fenwick, M.B., B.S., B.Sc. Lond., L.R.C.
M.R.C.S., Charing Cross Hospital; Godfrey Martin Huggin
L.R.C.P., M.R.C.S., St. Thomas's Hospital; Kenneth Macfarla
Walker, B.A. Cantab., L.R.C.P., M.R.C.S., Cambridge Universi
and St. Bartholomew's Hospital; William Elliott Carswell, M.B
Ch.B., New Zealand, L.R.C.P., M.R.C.S., New Zealan
ospital; Henry John Nightingal
M.R.C.S., St. Thomas's Hospital
B., Ch.B., New Zealand, *L.R.C.P*

tals; David McCrae Aitken
University and St. Thomas'
M.B., B.Ch., B.A.O. R.U.I.
Queen's College, Belfast, and London Hospital; Bryden Glen
dining, M.B., B.S. Durh., Durham
Thomas Killen, B.A., M.B., B.Ch.,
Belfast, and London Hospital; Jo
B.C. Cantab., Cambridge Universit
pital; and Robert Townley Slinger, M.B., Ch.B. Vict., Manchester
University and London Hospital.

The diploma of Member was conferred upon the following gentleman who has previously passed the Final Examination of the Conjoint Examining Board and has now complied with the by-laws:—

Robert William Walter Vaughan, Liverpool and University College Hospital.

Licences to practise Dental Surgery were conferred by the Council upon the undermentioned 33 gentlemen who have passed the resquisite examinations and complied with the by-laws of the College:—

Stammers Henry Alabaster, Charing Cross and Royal Dental Hospitals; Frederick George Hayward Armin, Charing Cross and Royal Dental Hospitals; Walter Pigott Barfoot, Charing Cross and Royal Dental Hospitals; Arthur Henry Bridges, Charing Cross and Royal Dental Hospitals; Stephen Wilson Charles, Guy's Hospital; Leonard Marshall Crockett, Charing Cross and Royal Dental Hospitals; George Leslie Curnock, Charing Cross and Royal Dental Hospitals; Norman Malcolm McArthur Douglas, Liverpool University; Max D
Hospital; Leona
Guanziroli, Cha
Edwin Guilding
Royal Dental Ho
versity; Ernest
Royal Dental H
Frederick Oscar
Hospital; Fred
William Stocks
Leeds University,
Edward Southcon
Harold Matthew
Pounds, Charing
Pugh, Guy's Hosp
Dental Hospitals;
Dental Hospitals;
Tibbalds, Guy's Hospital; Edgar Arthur Tomes.

The first part of the examination will comprise the following subjects. The elements of chemistry and physics: methods of chemical analysis and in particular the analysis of air and water. The laws of heat and the elements of pneumatics, hydrostatics, and hydraulics in their application to warming, ventilation, water-supply, and drainage. The geological and other conditions determining the healthiness of sites for dwellings. Sources, storage, and purification of water-supply. The elements of meteorology in relation to health. Principles of building construction in their application to dwellings, hospitals, and schools. The disposal of sewage and refuse and the general principles of sanitary engineering. Disinfectants, their chemistry and use. The chemical and microscopical examination of foods and the detection of the commoner forms of contamination. The methods of bacteriological investigation and analysis. The bacteriology of air, water, food, and soil. The general pathology of infection and of the diseases of animals that are transmissible to man. The second part of the examination will have reference to State Medicine and to the applications of Pathology and Sanitary Science, and will comprise the following subjects. Laws and Statutes relating to Public Health.[1] The model by-laws of the Local Government Board. Sanitation of dwellings, schools, factories, and workshops, and of villages and towns. Inspection of slaughter-houses, cowsheds, &c. Inspection of meat and other articles of food. General epidemiology, with special reference to the origin, pathology, symptoms, propagation, geographical distribution, and prevention of the epidemic, endemic, and other infective diseases both of temperate and of tropical climates. The methods applicable to the medical investigation of epidemics. Effects on health of overcrowding, vitiated air, impure water, polluted soils, and bad or insufficient food. Unwholesome trades and occupations and the diseases to which they give rise. Nuisances injurious or dangerous to health. The effects on health of season and climate. The principles and methods of vital statistics in relation to public health. (N.B.—The foregoing schedule is not to be understood as limiting the scope of the examination, which will include every branch of sanitary science. No candidate will be approved by the examiners who does not show a high proficiency in all the branches of study, scientific and practical, which bear upon the duties of medical officers of health.) The examinations in both parts will be oral and practical, as well as in writing. One day at least will be devoted to practical laboratory work and one day to oral and practical examination in, and reporting on, subjects connected with outdoor sanitary work. Candidates may present themselves for either part separately or for both together at their option; but the result of the examination in the case of any candidate will not be published until he has passed to the satisfaction of the examiners in both parts. Every candidate will be required to pay a fee of £6 6*s.* before admission or re-admission to *either part* of the examination, but candidates who have presented themselves before the year 1896 will be re-admitted to either part on payment of a fee of £5 5*s.* Every candidate who has passed both parts of the examination to the satisfaction of the examiners will receive a diploma testifying to his competent knowledge of what is required for the duties of a medical officer of health. All applications for information respecting this examination and the courses of study in the University should be addressed to Dr. Anningson, Walt-ham-sal, Barton-road, Cambridge, Secretary to the Syndicate. Candidates who desire to present themselves for the examination must send in their applications on forms supplied for the purpose and transmit them with the fees to Mr. J. W. Clark, Registrary, University of Cambridge, for the April examination on or before March 17th and for the October examination on or before Sept. 15th. The prescribed certificate must be sent to the Registrary so as to reach him not later than 10 A.M. on March 30th and Sept. 28th respectively. Cheques should be crossed "Barclay and Co., Ltd." The fee for either part of the examination cannot be returned to any candidate who fails to present himself; but he will be entitled, without an additional fee, to be a candidate on one subsequent occasion. Candidates must before admission to either part of the examination produce evidence of having satisfied provisions (1), (2), and (3), and before admission to Part II. having satisfied provision (4), above mentioned. The following is a list of colleges and schools of medicine at which the courses of laboratory instruction have, for the purposes of this examination, been already approved by the State Medicine Syndicate: The University Laboratories, Cambridge; London Hospital Medical College; St. Bartholomew's Hospital Medical College; King's College, London; University College, London; the Royal Army Medical College, London; the Victoria University of Manchester; the University of Durham Medical School, Newcastle-on-Tyne; University of Birmingham; University of Liverpool; St. Mary's Hospital Medical College; Charing Cross Hospital College; Westminster Hospital Medical School; University College, Bristol; the University of Leeds; Guy's Hospital Medical School; St. Mungo's College, Glasgow; Edinburgh University; *Middlesex Hospital Medical School*; Royal Southern Hospital, Liverpool; Royal Colleges, Edinburgh; Surgeons' Hall, Edinburgh; Trinity College, Dublin; Queen's College, Belfast; St. Thomas's Hospital Medical School; University College, Cardiff; University College, Sheffield; Medical School, Catholic University, Dublin; St. George's Hospital Medical School; University of Glasgow; University of Aberdeen; Anderson's College, Glasgow; and the Royal Institute of Public Health.

University of Durham.—Sanitary Science is the special object of the degrees in Hygiene. Candidates for the degree of Bachelor in Hygiene (B.Hy.) must be at least twenty-two years of age, registered, and a graduate in Medicine of a recognised university, and at least twelve months shall have elapsed after the date when the candidates obtained their first registrable qualification in Medicine, Surgery, and Midwifery before presenting themselves for examination. They shall spend six months at Newcastle-upon-Tyne studying Comparative Pathology, Practical Bacteriology, Outdoor Sanitary Work, Infectious Diseases, Sanitary Chemistry, and Physics. They have to pass an examination in Sanitary Chemistry, Physics, Comparative Pathology, Sanitary Legislation, Vital Statistics, *Nosology*, Climatology, Meteorology, Distribution of Health and Disease, Sanitary Medicine and Practical Hygiene. The fee for the examination for the degree of B Hy. is 10 guineas and for the degree £6 6*s.* The examination is divided into two parts and candidates *may present themselves for either part* or both together at their option. Candidates for the degree of Doctor *of Hygiene (D.Hy.) must have acquired* the degree of Bachelor in Hygiene, must for two years subsequently have been engaged in practice as a medical officer of health, and must write an essay upon some practical hygienic subject. The fee for the examination for the degree of D.Hy. is £5 and for the degree £6 6*s.* The regulation for education and examination for the Diploma in Public Health (D.P.H.) are the same as those for the degree of Bachelor of Hygiene, except that the candidate is not required to be a graduate in Medicine of a recognised University and the course of study *need not be passed at Newcastle-upon-Tyne.* The fee for the examination and Diploma in Public Health is 10 guineas.

Victoria University of Manchester.—An examination in Public Health is held twice yearly under the following regulations: The examination is in two parts and is written, oral, and practical. Candidates before entering for either part of the examination must have held for not less than twelve months a registrable qualification in Medicine, Surgery, and Midwifery, and must present satisfactory certificates of having attended courses of instruction in Public Health in the University, or in a college or medical school recognised for this purpose by the University; of having attended, after obtaining a registrable qualification, during at least six months, practical instruction in a laboratory approved by the University, the courses including Chemistry as applied to Public Health, Bacteriology, and the Pathology of those diseases of animals which are communicable from animals to man; of having, after obtaining a registrable qualification, attended for three months the *clinical practice of a hospital for infectious* diseases; of having, after obtaining a registrable qualification, practically studied the duties of outdoor sanitary work for not less than six months under the medical officer of health of a county or of a large urban district. Candidates macy Act, 1868, provided that such preparations be sold in closed pers bearing in legible characters the name of a pharmaceutical nist or of a chemist and druggist registered under the Pharmacy , 1868, as a compounder of the preparation." Mr. SAMUEL, who in charge of the Bill, firmly refused to assent to any proposal ch would allow those preparations to be sold by tradesmen all r the country. Accordingly the amendment was not accepted. the motion of Mr. SAMUEL belladonna plasters were excepted from t I. of the schedule.

---

[1] All candidates will be examined in the provisions of the English Statutes relating to public health, but any candidate will be given an opportunity of showing a special knowledge of other sanitary laws in operation within the British Empire, provided that, *when applying for admission to the examination, he give notice* of his desire and indicate the special law he proposes to offer.

The Fate of Bills.

Ir. ASQUITH in announcing the intentions of the Government on dnesday, Dec. 9th, with regard to its programme for the remainder the session, indicated the Bills which he hoped would be carried s year. Amongst these he mentioned the Poisons and Pharmacy l. However, if opposition to the Tuberculosis Prevention (Ireland) l developed more than was anticipated the Government would not e effective steps to press it through its remaining stages this sion. The Housing and Town Planning Bill was not to be further anced this session but the Prime Minister promised that it would reintroduced at an early period of next session when its committee ge would be curtailed within as narrow dimensions as was reasonly possible.

Lotteries and Indecent Advertisements.

he Home Office has promised to introduce legislation next session the subject of Lotteries and Indecent Advertisements.

The Housing and Town Planning Bill.

The order for the consideration on report of the Housing and Town anning Bill has been discharged and the Bill withdrawn.

HOUSE OF COMMONS.

THURSDAY, DEC. 10TH.

The Analyst for County Cavan.

Mr. VINCENT KENNEDY asked the Chief Secretary to the Lord ieutenant of Ireland to state who was the analyst for county Cavan, hen he was appointed, where his laboratory was situated, what staff as employed there, for how many counties did he act as analyst, how nany samples were submitted to him in the years 1905-06-07, how many f these samples did he personally analyse, and what was the total salary paid him, distinguishing the amount paid by county Cavan.—Mr. BIRRELL replied: The analyst for county Cavan is Sir Charles Cameron who was appointed in 1878. His laboratory is in *Castle-street, Dublin*, but I have no means of knowing what staff he employs in it. He acts as public analyst for 24 counties and the salary paid to him by county councils, including £60 from county Cavan, amounts to £1005. *He* also receives £385 per annum as analyst for eight boroughs. There is no official record of the number of samples submitted to him in 1905-06-07, but the county council might be able to supply the honourable Member with the information.

The Milk Bill.

Mr. COURTHOPE asked the President of the Local Government Board when the Milk Bill would be printed.—Mr. BURNS answered: It would not be practicable for the Bill to make any progress this year, and it will, I think, be best to defer its introduction until next session.

The Sanitary Condition of Tin Works.

Mr. JOHN WILLIAMS asked the Secretary of State for the Home De-
had been drawn to the badly ventilated
rly the whole of the tin works situate at
ad whether he was aware that the conditions under which work was carried on at those works were conducive to sickness, severe illness, and, in some cases, consumption; and whether, if such conditions existed, he would cause instructions to be given to the owners thereof to make the work and to carry out the improvements necessary for the preservation of the health of the workmen thereat.—Mr. GLADSTONE (by written *answer) replied*. I have no information as to any specific cases of illness at the works in question, but I am aware that, not only at these works but in tinplate works generally, the conditions as *regards* ventilation need considerable improvement, and the question of the best means to secure the removal of fumes and dust has been receiving special attention from the Factory Department. During the last three months a large number of works have been visited by the inspector and special
rried out at
known, the

MONDAY, DEC. 14TH.

The Medical Inspector of Estates' Hospitals, British Guiana.

Sir HENRY COTTON asked the Under Secretary of State for the Colonies whether his attention had been drawn to the fact that the Governor of British Guiana did, by his casting vote against the almost unanimous objection of the elected members of the Combined Court of the Colony, decide, on Nov. 3rd last, on the abolition of the office of medical inspector of estates' hospitals; whether the salary of that office, which was instituted for the protection of Indian immigrants indentured for service on sugar plantations, was secured *by* the law of the colony; whether the Government of India had been consulted and had agreed to the abolition of this office; and whether the Secretary of State proposed to take any action in the matter.—Colonel SEELY *replied: The* facts stated in the first part of my honourable friend's question are, generally correct, and the action of the Governor was in accordance with the law which expressly provides that he shall have *both* an original and a casting vote, but I may explain that if, as is proposed, the separate office of medical inspector is abolished, arrangements will be made for the efficient discharge of the duties hitherto attached to it, experience having shown that they are not sufficient to occupy the whole time of one officer. It has not in the circumstance been considered necessary to consult the Government of India. The law of the colony imposes no obligation to appoint a separate officer for the sole purpose of medical inspection, although it empowers the Governor to appoint such an officer at a salary not exceeding £1000 per annum. At the Governor's instance, the whole matter has been deferred for the present, pending further discussion in the Combined Court.

Quarantine Regulations in Spain.

Mr. M'ARTHUR asked the Secretary of State for Foreign Affairs whether his attention had been called to the periods for which vessels arriving in Spain from Liverpool had been *detained in quarantine* on account of recent cases of plague in Liverpool; whether he was aware that the detention had amounted to as much as 20 days, although the *International Sanitary Convention of 1903 (to which all European* countries, except Spain, Greece, and Norway, were parties) decided that a period of five days' quarantine, computed from the date of isolation of the last-known case of plague at the infected port, was sufficient; and whether he would make representations to the Government of Spain with a view of bringing the usage of that country into accord with that prevailing in other European countries, so as to minimise the loss and inconvenience to which British shipowners and merchants were subjected.—Mr. MCKINNON WOOD (on behalf of Sir EDWARD GREY) replied: The answer to the first part of the question is in the affirmative. I am not aware that detention in *quarantine* in Spanish ports has amounted to as much as 20 days. 12 days was the period fixed in the first instance by the Spanish Sanitary Regulations; but representations were *made by His Majesty's Ambassador at Madrid* and subsequently the Spanish Government gave free pratique to healthy vessels arriving from Liverpool, subject to certain reservations in accordance with the Venice Sanitary Convention *to which Spain is a* party. His Majesty's Government recognises the importance of securing uniformity and a common standard of regulations, as provided by the Paris Convention, and will do all in its power *to facilitate* its general application.

Christmas Gifts in the Hospitals of the Metropolitan Asylums Board.

Mr. MYER asked the President of the Local Government Board *whether he was aware that subscription lists* were presented to the nurses in the hospitals of the Metropolitan Asylums Board, whose salaries ranged from £24 to £25 per annum, soliciting subscriptions for *Christmas gifts to the matron* and assistant matron, and day and night sisters, and also that the nurses were expected to give presents to the day and night servants, to the nurses rooms' servants and the gate porters; and whether he would communicate with the Asylums Board immediately, so that notices might be posted before the ensuing Christmas, discountenacing the system of the receipt of gifts by any of *their officials*.—Mr. BURNS answered: I have communicated with the Asylums Board with regard to this matter, and I find that inquiries with regard to it have been made by them at all their hospitals. I understand that the replies received show that in the large majority of cases nothing of the kind mentioned in the question took place, but that *in one* instance the practice referred to appears to have prevailed, and that in two or three *others* there has been some such practice, although of a more limited and partial character. I am glad to say, however, that instructions were given on Saturday last to the medical superintendent in each of these cases to the effect that the practice should be discontinued forthwith.

TUESDAY, DEC. 15TH.

The Indian Medical Service.

Mr. KETTLE asked the Under Secretary of State for India whether he was aware of the difficulties in the path of capable Indians *desirous of* presenting themselves at the competitive examination for the Indian Medical Service held in England and of the disadvantages under which they were placed as compared with *the people of this country*; and what steps he proposed to take in order to remove these disabilities *from the* people of India and to afford them reasonable opportunities *for rising* in the medical service of their country. The *honourable* gentleman further asked whether the professors of the Medical College and the physicians and surgeons at the General Hospital, Madras, were military officers attached to the Indian Medical Service and lent to the civil authorities; whether medical gentlemen outside the ranks of this Service were debarred from filling those posts and were allowed to serve only in subordinate ranks; whether he was aware of the discontent amongst members of the subordinate service owing to their being shut off *from the higher appointments* for want of a commission in the army; and whether he proposed to make any recommendations to the Government of India on the subject.—Mr. BUCHANAN said in *reply: Perhaps the honourable* Member will permit me to answer his two questions together. The professors of the Medical College and the physicians and surgeons of the General Hospital, Madras, are at present officers of the Indian Medical Service, which is recruited for both military and civil duty. Medical officers outside that service are not shut off from higher appointments, although *in practice* they seldom attain the highest posts. The Secretary of State does not consider the present condition of the matter to be satisfactory and is in communication with the *Government of India* as to the desirability of promoting the growth of an independent medical profession in India and of extending the employment of civil medical practitioners recruited in India.

Medical Inspection of School Children.

Mr. GEORGE ROBERTS asked the President of the Board of Education whether steps had yet been taken to carry into effect the promise of his predecessor in office, made to a deputation from the County Councils' Association in February last, to give financial aid *to local* education authorities in respect *of the cost of organising* and carrying out medical inspection in schools; and, if so, whether he would state the nature of the proposals and when they would *come* into operation.—Mr. RUNCIMAN replied: My predecessor's *statement* referred to the additional money proposed to be provided in connexion with the Education Bill. *I am not in a position* to make any statement as to the possibility of giving an increased Exchequer grant in aid of elementary education.

The Administration of Anæsthetics.

Mr. BRAMSDON asked the Secretary of State for the Home Department whether his attention had been called to certain deaths under anæsthetics; whether he had yet received the contemplated reply from the President of the General Medical Council *to* the communication addressed to him and the *nature* of such reply; and whether, having regard to the number of deaths that were constantly

The first part of the examination will comprise the following subjects. The elements of chemistry and physics: methods of chemical analysis and in particular the analysis of air and water. The laws of heat and the elements of pneumatics, hydrostatics, and hydraulics in their application to warming, ventilation, water-supply, and drainage. The geological and other conditions determining the healthiness of sites for dwellings. Sources, storage, and purification of water-supply. The elements of meteorology in relation to health. Principles of building construction in their application to dwellings, hospitals, and schools. The disposal of sewage and refuse and the general principles of sanitary engineering. Disinfectants, their chemistry and use. The chemical and microscopical examination of foods and the detection of the commoner forms of contamination. The methods of bacteriological investigation and analysis. The bacteriology of air, water, food, and soil. The general pathology of infection and of the diseases of animals that are transmissible to man. The second part of the examination will have reference to State Medicine and to the applications of Pathology and Sanitary Science, and will comprise the following subjects. Laws and Statutes relating to Public Health.[1] The model by-laws of the Local Government Board. Sanitation of dwellings, schools, factories, and workshops, and of villages and towns. Inspection of slaughter-houses, cowsheds, &c. Inspection of meat and other articles of food. General epidemiology, with special reference to the origin, pathology, symptoms, propagation, geographical distribution, and prevention of the epidemic, endemic, and other infective diseases both of temperate and of tropical climates. The methods applicable to the medical investigation of epidemics. Effects on health of overcrowding, vitiated air, impure water, polluted soils, and bad or insufficient food. Unwholesome trades and occupations and the diseases to which they give rise. Nuisances injurious or dangerous to health. The effects on health of season and climate. The principles and methods of vital statistics in relation to public health. (N.B.—The foregoing schedule is not to be understood as limiting the scope of the examination, which will include every branch of sanitary science. No candidate will be approved by the examiners who does not show a high proficiency in all the branches of study, scientific and practical, which bear upon the duties of medical officers of health.) The examinations in both parts will be oral and practical, as well as in writing. One day at least will be devoted to practical laboratory work and one day to oral and practical examination in, and reporting on, subjects connected with outdoor sanitary work. Candidates may present themselves for either part separately or for both together at their option; but the result of the examination in the case of any candidate will not be published until he has passed to the satisfaction of the examiners in both parts. Every candidate will be required to pay a fee of £6 6*s*. before admission or re-admission to *either part* of the examination, but candidates who have presented themselves before the year 1896 will be re-admitted to either part on payment of a fee of £5 5*s*. Every candidate who has passed both parts of the examination to the satisfaction of the examiners will receive a diploma testifying to his competent knowledge of what is required for the duties of a medical officer of health. All applications for information respecting this examination and the courses of study in the University should be addressed to Dr. Anningson, Walt-ham-sal, Barton-road, Cambridge, Secretary to the Syndicate. Candidates who desire to present themselves for the examination must send in their applications on forms supplied for the purpose and transmit them with the fees to Mr. J. W. Clark, Registrary, University of Cambridge, for the April examination on or before March 17th and for the October examination on or before Sept. 15th. The prescribed certificate must be sent to the Registrary so as to reach him not later than 10 A.M. on March 30th and Sept. 28th respectively. Cheques should be crossed "Barclay and Co., Ltd." The fee for either part of the examination cannot be returned to any candidate who fails to present himself; but he will be entitled, without an additional fee, to be a candidate on one subsequent occasion. Candidates must before admission to either part of the examination produce evidence of having satisfied provisions (1), (2), and (3), and before admission to Part II. having satisfied provision (4), above mentioned. The following is a list of colleges and schools of medicine at which the courses of laboratory instruction have, for the purposes of this examination, been already approved by the State Medicine Syndicate: The University Laboratories, Cambridge; London Hospital Medical College; St. Bartholomew's Hospital Medical College; King's College, London; University College, London; the Royal Army Medical College, London; the Victoria University of Manchester; the University of Durham Medical School, Newcastle-on-Tyne; University of Birmingham; University of Liverpool; St. Mary's Hospital Medical College; Charing Cross Hospital College; Westminster Hospital Medical School; University College, Bristol; the University of Leeds; Guy's Hospital Medical School; St. Mungo's College, Glasgow; Edinburgh University; Middlesex Hospital Medical School; Royal Southern Hospital, Liverpool; Royal Colleges, Edinburgh; Surgeons' Hall, Edinburgh; Trinity College, Dublin; Queen's College, Belfast; St. Thomas's Hospital Medical School; University College, Cardiff; University College, Sheffield; Medical School, Catholic University, Dublin; St. George's Hospital Medical School; University of Glasgow; University of Aberdeen; Anderson's College, Glasgow; and the Royal Institute of Public Health.

University of Durham.—Sanitary Science is the special object of the degrees in Hygiene. Candidates for the degree of Bachelor in Hygiene (B.Hy.) must be at least twenty-two years of age, registered, and a graduate in Medicine of a recognised university, and at least twelve months shall have elapsed after the date when the candidates obtained their first registrable qualification in Medicine, Surgery, and Midwifery before presenting themselves for examination. They shall spend six months at Newcastle-upon-Tyne studying Comparative Pathology, Practical Bacteriology, Outdoor Sanitary Work, Infectious Diseases, Sanitary Chemistry, and Physics. They have to pass an examination in Sanitary Chemistry, Physics, Comparative Pathology, Sanitary Legislation, Vital Statistics, Nosology, Climatology, Meteorology, Distribution of Health and Disease, Sanitary Medicine and Practical Hygiene. The fee for the examination for the degree of B.Hy. is 10 guineas and for the degree £6 6*s*. The examination is divided into two parts and candidates may present themselves for either part or both together at their option. Candidates for the degree of Doctor of Hygiene (D.Hy.) must have acquired the degree of Bachelor in Hygiene, must for two years subsequently have been engaged in practice as a medical officer of health, and must write an essay upon some practical hygienic subject. The fee for the examination for the degree of D.Hy. is £5 and for the degree £6 6*s*. The regulation for education and examination for the Diploma in Public Health (D.P.H.) are the same as those for the degree of Bachelor of Hygiene, except that the candidate is not required to be a graduate in Medicine of a recognised University and the course of study need not be passed at Newcastle-upon-Tyne. The fee for the examination and Diploma in Public Health is 10 guineas.

Victoria University of Manchester.—An examination in Public Health is held twice yearly under the following regulations: The examination is in two parts and is written, oral, and practical. Candidates before entering for either part of the examination must have held for not less than twelve months a registrable qualification in Medicine, Surgery, and Midwifery, and must present satisfactory certificates of having attended courses of instruction in Public Health in the University, or in a college or medical school recognised for this purpose by the University; of having attended, after obtaining a registrable qualification, during at least six months, practical instruction in a laboratory approved by the University, the courses including Chemistry as applied to Public Health, Bacteriology, and the Pathology of those diseases of animals which are communicable from animals to man; of having, after obtaining a registrable qualification, attended for three months the clinical practice of a hospital for infectious diseases; of having, after obtaining a registrable qualification, practically studied the duties of outdoor sanitary work for not less than six months under the medical officer of health of a county or of a large urban district. Candidates possibility of action at law, …… *only a comparatively small* number have found their way into the courts." The name of the union has been found a powerful deterrent in threatened action for malpraxis.

---

[1] All candidates will be examined in the provisions of the English Statutes relating to public health, but any candidate will be given an opportunity of showing a *special* knowledge of other sanitary laws in operation within the British Empire, provided that, *when applying for admission to the examination, he give notice* of his desire and indicate the special law he proposes to offer.

DONATIONS AND BEQUESTS. — Mr. Matthew George Megaw has left £1000 to St. Bartholomew's Hospital for the building fund and £1000 to Guy's Hospital for general purposes. The late Mr. J. L. Perrin of Bristol has bequeathed £500 each to the following institutions: the Royal Ear Hospital, Soho, London; the Swansea General Hospital; Bristol General Hospital; Bristol Royal Infirmary; Bristol Dispensary; Bristol Eye Hospital; and Bristol Hospital for Women.

REUBEN HARVEY MEMORIAL PRIZE.—The ninth award of this triennial prize will be made on July 1st, 1909. The competition for the prize is open to all students of the various schools of medicine in Dublin which are recognised by the medical licensing bodies in Ireland and also to graduates or licentiates of these bodies of not more than three years' standing at the time of the award. The prize, value £25, will be awarded to the writer of the best essay, on a subject to be selected by the candidate, evidencing original research in animal physiology or pathology, the essay to be illustrated by drawings or preparations. The essays, bearing fictitious signatures, are to be lodged with the Registrar of the Royal College of Physicians, Kildare-street, Dublin, on or before June 1st, 1909.

THE INCORPORATED SOCIETY FOR THE DESTRUCTION OF VERMIN: THE QUESTION OF RAT VIRUS.—A meeting of the scientific committee of the Incorporated Society for the Destruction of Vermin, at which Dr. W. Collingridge, medical officer of health of the City of London, was present by invitation, convened to discuss the possible danger attending the use of rat virus, was held at the offices of the society, 95, Wigmore-street, W., on Dec. 10th. Sir Lauder Brunton presided and the following gentlemen were among those present: Dr. H. E. Annett, Dr. Louis W. Sambon, and Dr. F. M. Sandwith, also Mr. W. R. Boelter, Mr. Fletcher Barrett, Mr. F. V. Theobald, and Mr. A. E. Moore, secretary. It was resolved, on the motion of Sir Lauder Brunton, seconded by Dr. Sambon, that—

> In view of the great importance of the matter to the public urgent representations be made to the Government that suitable experiments be instituted to determine whether the various bacteriological preparations used for the destruction of rats and mice are, or may be likely to become, capable of producing disease in man and domesticated animals.

LITERARY INTELLIGENCE.—Messrs. Baillière, Tindall, and Cox have been authorised on behalf of the Department of Education of the Soudan Government to undertake in future the issue of the reports of the Wellcome Research Laboratories at the Gordon Memorial College, Khartoum. Up to the present two volumes have been issued, covering a period from the foundation of these laboratories in 1903 to 1906. The third report will be issued at the beginning of next year, bringing the work up to 1908. The Soudan Department of Education has taken this step to meet the considerable demand for these reports which has arisen amongst medical men and other scientific workers interested in tropical research. Hitherto only a limited number of copies has been issued and these reports have been sent gratuitously to Government departments and to various medical, sanitary, and other institutions interested as well as to a few leading authorities on the subjects dealt with. The work of these laboratories has so far extended that the forthcoming third report will contain some 475 pages of detailed records of many interesting experiments and researches, principally connected with tropical medicine. The book will be illustrated and will include many coloured plates. Simultaneously with the third report, and as a supplement to it, will be issued a review of the progress made in tropical medicine during recent years, compiled by Dr. Andrew Balfour, director of the laboratories, and Dr. R. C. Archibald. The great cost of production of these reports, especially in their present voluminous dimensions, necessitates making a charge for them henceforth. The price fixed will be as moderate as is consistent with the cost of publication and any profit made on them will be devoted by the Soudan Department of Education to a special fund to be applied to future publications of the laboratories. All applications for current publications and for reprints of the first and second reports of the Wellcome Research Laboratories, Khartoum, should dressed to Messrs. Baillière, Tindall, and Cox, London.

SOCIETY OF MEMBERS OF THE ROYAL COLLEGE SURGEONS OF ENGLAND.—The annual meeting of t members of this society was held at Frascati's Restaura on Dec. 8th. Expressions of regret were made at t continued opposition of the Council of the Royal College Surgeons in refusing to accede to any of the repeated applic tions for more efficient representation and also pointing o that under the Midwifery, Factory, and Vaccination Act as well as the examinations of the Territorials, much bett fees could have been obtained if the professional units cou have relied upon the support of those who are pledged to d so. The officers were elected for the coming year and t funds were reported to be in a prosperous condition, no withstanding the heavy expense of the poll of the membe of the society caused by the recent action of the Colleg Several new members were elected and a hearty vote thanks was accorded to Mr. Joseph Smith, J.P., for presidin during the past year.

RESEARCH DEFENCE SOCIETY.—A meeting was held on Dec. 11th, at St. William's College, York under the chairmanship of Mr. W. F. H. Thompson, J.P., to inaugurate a York branch of the Research Defence Society. A large and representative company included the Hon. Mrs. Maclagan, the Dean and sub-Dean of York, Canon Argles, Canon Robinson, and many other clergymen. After the chairman had asked for an open-minded consideration of the case, Mr. Stephen Paget delivered an address in which he demonstrated the necessity to science of experiments on animals, using the arguments which we have published on previous similar occasions. Other speeches followed, which included two striking vindications of the experimental method by Canon Watson and the Dean of York. The latter said that "he was the chairman of a vivisection institution in that city, where vivisection was going on constantly and was going on that day. He meant the county hospital." With regard to Mr. Paget's remarks, the Dean said that "they had his statements on such testimony that they could not refuse to believe it. They could not believe that these men were palming off on them a quantity of fables that were untrue." Mr. W. Hood testified to the value of diphtheria antitoxin. The Rev. C. Owen and Mr. W. H. Jalland also spoke in favour of the society's aims. The Rev. J. Brighting and Miss Ansell put a certain number of hostile questions which were answered by Mr. Paget whom Miss Ansell is reported to have interrupted so frequently in the process that she had to be called to order by the chairman. Mr. H. V. Scott moved a vote of thanks to the lecturer and to the chairman, and Dr. P. Macdonald in seconding it remarked that at a recent lecture in York much had been made of the removal of the stomach and entrails of a dog. He knew a parallel case in which a somewhat similar rearrangement had been made in an "animal's" internal economy. That "animal" was a man whose life had been saved by the operation which had been done two years ago. He was likely to live to be an old man. This unanswerable illustration of the humane lessons to be learnt from animal experiment was warmly acclaimed by the audience. Dr. G. S. Hughes is the secretary of the new branch and we may remind our northern readers that the objects of the society are best served by recruiting non-medical members. It now numbers some 1800 persons.

Parliamentary Intelligence.

NOTES ON CURRENT TOPICS.

The Poisons and Pharmacy Bill.

THE Poisons and Pharmacy Bill has passed through its committee stage in one of the Standing Committees of the House of Commons. The principal alteration made in the measure was the adaptation of Clause 3 to embody the compromise between the pharmaceutical chemists and the drug store companies, which was explained by Mr. H. SAMUEL during the debate on the motion for the second reading of the Bill. The drug store companies under this arrangement must appoint a superintendent to manage the poisons department. There was some discussion on the clause to regulate the sale of certain poisonous substances for agricultural and horticultural purposes. An amendment was proposed to extend the regulations to "medical preparations containing any of the poisons from time to time comprised in Part II. of Schedule A to the

Health. The fees are £3 3*s.* for the First and £3 3*s.* for the Second B.Sc. Examinations, and £10 10*s.* for the degree of D.Sc.

University of Aberdeen.—The Diploma in Public Health (D.P.H.) is conferred only on graduates in Medicine of a University in the United Kingdom; and a period of not less than 12 months must elapse between medical graduation and entrance to the examination for the diploma. Every candidate must produce evidence of having attended, after graduation in Medicine, during a period of six months, practical instruction in Hygiene and Bacteriology in laboratories approved of by the University, together with having during six months (whereof three months must be distinct from the period of laboratory instruction) been diligently engaged in acquiring a practical knowledge of the duties, routine and special, of Public Health administration under the medical officer of health of a county or large urban district. He must have regularly attended for three months the practice of a hospital for infectious diseases at which opportunities are afforded for the study of methods of administration. He must also have obtained practical instruction in the drawing and interpretation of plans. Every candidate who is not a graduate in Medicine of this University must have attended a course of instruction in the University in one or more of the subjects embraced in the examination for the diploma. The diploma is conferred after an examination in Public Health held in March and July of each year. Candidates must send in their names, with the necessary fee, to the Secretary of the Medical Faculty a fortnight before the examination. The fee is £5 5*s.* The examination is conducted by specially qualified examiners appointed by the University. Candidates may enter for the whole examination at one period or they may enter for Part I. at one period and for Part II. at another and subsequent period.

Royal University of Ireland.—This University grants a Diploma in Public Health. It is conferred only on graduates in Medicine of the University. Candidates are not admitted to this examination until the lapse of 12 months from the time of obtaining the M.B., B.Ch., B.A.O. degrees; they must give notice in writing to the Secretaries of their intention to present themselves and must pay the fee, £2, at least one month previously to the examination. Candidates are required to produce a certificate of having, after obtaining the degrees of M.B., B.Ch., B.A.O., attended six months' practical instruction in a laboratory approved by the University, and also of having for six months practically studied the duties of outdoor sanitary work under the medical officer of health of a county or large urban district, and also of having attended for a period of three months the practice of a hospital for infectious diseases. Candidates at this examination must answer in the following subjects: (1) Physics, (2) Chemistry, (3) Meteorology, (4) Sanitary Engineering and Architecture, (5) Bacteriology, and (6) Hygiene, Sanitary Law, and Vital Statistics.

University of Dublin.—The Diploma in Public Health is conferred, after examination, on the following conditions. The candidate must be a Doctor in Medicine or a graduate in Medicine, Surgery, and Midwifery of Dublin, Oxford, or Cambridge. The candidate must have obtained a registrable qualification at least 12 months before the examination. The candidate must have completed (unless registered as a practitioner on or before Jan. 1st, 1890), subsequently to obtaining a registrable qualification, six months' practical instruction in a chemical and bacteriological laboratory or laboratories approved by the University, must have studied practically outdoor sanitary work for six months under an approved officer of health (at least three months of this period being distinct from the time spent in laboratory work), and must have spent three months in a fever hospital where opportunities are afforded for the study of methods of administration. The subjects of examination are:—Part I.: Chemistry, Bacteriology, Hygiene, Pathology (including methods of post-mortem examinations), Physics, and Meteorology. Part II.: Hygiene and Epidemiology, Vital Statistics, Public Health Law, and Sanitary Engineering and Reports.

Royal College of Physicians of London and the Royal College of Surgeons of England.—The following are the regulations for obtaining the Diploma in Public Health: Section 1: Candidates must be registered under the Medical Act. The examination consists of two parts. The fee for each part is £6 6*s.* A candidate intending to present himself must give 14 days' written notice to the Secretary at the Examination Hall, Victoria Embankment, W.C. A candidate registered under the Medical Act on or before Jan. 1st, 1890, will be admissible to Part I. of the examination on producing evidence of being at least 23 years of age, and to Part II. on producing evidence of being at least 24 years of age. A candidate registered under the Medical Act after Jan. 1st, 1890, will be admissible to examination in Part I. on producing evidence (1) of having been in possession of a registrable qualification in Medicine, Surgery, and Midwifery for at least 12 months; (2) of having attended, after obtaining such registrable qualification, practical instruction in a laboratory recognised by the Examining Board in England during a period of six months; and (3) of being at least 23 years of age. A candidate will be admitted to Part II. of the examination on producing evidence (1) of having been associated day by day in the duty, routine and special, of Public Health administration during six months (of which at least three months shall be distinct and separate from the period of laboratory instruction required under Par. 2 for Part I.) under the supervision of a medical officer of health who fulfils certain conditions which can be ascertained on application to the secretary[2]; (2) of having attended the clinical practice of a hospital for infectious diseases recognised by the Examining Board in England, after obtaining his registrable qualification in Medicine, Surgery, and Midwifery; and (3) of being at least 24 years of age.

The Royal College of Physicians of Edinburgh, the Royal College of Surgeons of Edinburgh, and the Faculty of Physicians and Surgeons, of Glasgow.—All candidates for the Diploma in Public Health must have been qualified for at least one year. Those qualified before 1890 do not require to produce evidence of attendance on any special courses. All other candidates must have attended, after qualifying, six months' practical instruction in a recognised laboratory or laboratories, and must have studied for six months the duties of outdoor sanitary work under the medical officer of health of a county or large urban district or a medical officer of health who is also a teacher of Sanitary Science in a Medical School, or a sanitary staff officer of the Royal Army Medical Corps having charge of an Army Corps District or command. There are two examinations, and candidates may enter for both at one period or for either separately. The First Examination includes (*a*) Laboratory Work (Chemistry and Bacteriology), (*b*) Physics, and (*c*) Meteorology; and the Second Examination embraces (*a*) Report on Premises visited, (*b*) Examination at Fever Hospital, (*c*) Examination at Public Abattoir, (*d*) Written and Oral Examinations on Epidemiology and Endemiology, (*e*) Vital Statistics and Sanitary Law, and (*f*) Practical Sanitation. The fee is 12 guineas for both examinations, or 6 guineas for either of them. A fee of 3 guineas is payable by rejected candidates for either examination. The examination is held twice yearly, in May and October. The published regulations provide detailed synopses of the subjects of examination. The Registrar for Edinburgh is Mr. James Robertson, solicitor, 54, George-square, and for Glasgow Mr. Alexander Duncan, LL.D., 242, St. Vincent-street.

Royal College of Physicians and Royal College of Surgeons in Ireland.—Stated examinations for the Diploma in Public Health are held in the months of February, May, July, and November. A special examination for the diploma may, at the discretion of the Committee of Management (except during the months of August and September), be obtained on payment of £15 15*s.*, in addition to the ordinary fees mentioned below, and on giving notice at least one fortnight before the date of the proposed examination. Every candidate for the Diploma in Public Health must be a registered medical practitioner. (Candidates registered or entitled to be registered prior to January, 1890, are exempt from the rules as to study.) He must subsequently to qualification (1) receive six months' laboratory instruction in Chemistry, Bacteriology, and the Diseases of Animals

---

[2] Provided that the period of six months may be reduced to a period of three months (which shall be distinct and separate from the period of laboratory instruction required under Regulation 2) in the case of any candidate who produces evidence that after obtaining a registrable qualification, he has during three months attended a course or courses of instruction in sanitary law, sanitary engineering, vital statistics, and other subjects bearing on public health administration given by a teacher or teachers in the department of public health of a recognised medical school.

DEATHS.

JACKSON.—On Dec. 8th, 1908, Arthur Molyneux Jackson, M.D. Oxon., M.R.C.S., Medical Superintendent of Notts County Asylum at Radcliffe-on-Trent.

N.B.—A fee of 5s. is charged for the insertion of Notices of Births, Marriages, and Deaths.

12 months. 6. Of having attended at a recognised hospital the practice of Surgery and Clinical Lectures on Surgery for twelve months during the ordinary sessions. 7. Of being 21 years of age. The certificates of professional study will be required to show that students have attended the courses of professional study to the satisfaction of their teachers. Candidates may present themselves for the Second Professional Examination after the completion of four years' professional study from the date of registration as a dental student and after the lapse of not less than six months from the date of passing the First Professional Examination. The Second Professional Examination consists of: Part I., General Anatomy and Physiology, General Surgery and Pathology; Part II., Dental Anatomy and Physiology, Dental Pathology and Surgery, and Practical Dental Surgery. The written examination in Part I. comprises General Anatomy and Physiology, General Pathology and Surgery, and in Part II., Dental Anatomy and Physiology, and Dental Pathology and Surgery. At the Practical Examination candidates may be examined (*a*) on the treatment of Dental Caries and may be required to prepare and fill cavities or to do any other operation in Dental Surgery (candidates must provide their own instruments); (*b*) on the Treatment of the various irregularities of Children's Teeth. There is also an Oral Examination. Candidates may take the two parts of the examination together or separately. Candidates must pass Part I. before proceeding to Part II. If they fail in Part I. they are not allowed to proceed with Part II. Exemption from the Preliminary Science Examination is granted to candidates who have passed an Examination in Chemistry and Physics for a degree in Medicine at a University in the United Kingdom, in India, or in a British colony. Exemption from Examination in Anatomy and Physiology is granted to candidates who have passed the Second Examination of the Examining Board in England or the corresponding Examination for any degree or qualification in medicine or surgery registrable under the Medical Act of 1886. Exemption from Examination in General Surgery and Pathology is granted to candidates who have passed the Examination in Surgery of the Examining Board in England or the corresponding Examinations of the Colleges and Universities above mentioned. The fee for the diploma is 20 guineas and is payable as follows:—Preliminary Science Examination, 3 guineas; First Professional Examination, 2 guineas; Second Professional Examination, 5 guineas; the balance to be paid on the completion of the Examinations. The Preliminary Science Examination is held in January, March, or April, July, and October in each year. The First and Second Professional Examinations are held in May and November in each year. Candidates must give 21 clear days' notice of their intention to present themselves for examination.

Royal College of Surgeons, Edinburgh.—For the Licence in Dental Surgery all candidates must pass a Preliminary Examination in General Knowledge and have their names inscribed in the Register of Dental Students of the General Medical Council. A copy of regulations giving a list of Preliminary Examinations recognised for obtaining this Licence, as well as of the subjects of the Professional Examinations, may be obtained from Mr. D. L. Eadie, Clerk to the Royal College of Surgeons, at 54, George-square, Edinburgh. Students who commenced their professional education by apprenticeship or attendance on lectures before July 22nd, 1878, are exempt from the Preliminary Examinations. Candidates must produce certificates of having, subsequently to the date of registration, been engaged for four years in professional studies and of three years' instruction in Mechanical Dentistry from a registered dental practitioner, except in the case of previously registered medical practitioners, when two years will be considered sufficient. Candidates who have commenced their studies after Oct. 31st, 1898, must have attended the following curriculum: Anatomy, one course of six months; Practical Anatomy, twelve months; Chemistry, with Laboratory Instruction, one course of six months; Physics, with Laboratory Instruction, three months; Physiology, with Laboratory Instruction, one course of six months; Surgery, including Surgical Pathology, one course of six months; Medicine, including Medical Pathology, one course of six months; and attendance on the practice of a recognised general hospital, with Clinical Instruction on Surgery and Medicine, twelve months. These courses must have been attended at a University or in an established school of medicine or in a provincial school specially recognised by the College as qualifying for the diploma in Surgery. In addition to these courses candidates will be required to have attended in a recognised dental hospital, or with teachers recognised by the College, the following special courses of lectures and instruction: Dental Anatomy and Physiology (Human and Comparative) (not less than 24 lectures), with Practical Dental Histology, three months; Dental Surgery and Pathology (not less than 20 lectures), with the Materia Medica and Therapeutics applicable to Dental Surgery, three months; Dental Mechanics (not less than 12 lectures), Theoretical and Practical, with Dental Metallurgy, three months—one course each; two years' attendance at a dental hospital or the dental department of a general hospital recognised by the College. Practical instruction in Mechanical Dentistry from a registered Dentist, or in the Mechanical Department of a recognised dental hospital and school, as apprentices or otherwise, either before or after registration, for three years. Certificates of attendance on such of these courses as may be respectively required will entitle candidates to appear either for the First Dental Examination or for the First and Second Examinations for the Triple Qualification, as they may select, and subject to the existing regulations for each qualification. Candidates who have passed the First and Second Examinations for the Triple Qualification will be exempt from the First Dental Examination and will have the advantage of being admissible either to the Final Dental Examination or to the subsequent Examination for the Triple Qualification, or to both. But the First Dental Examination will not be held as equivalent to the First and Second Triple Examinations and will admit to the Final Dental Examination only. Candidates who are Licentiates of this College or who may be registered medical practitioners will be required to produce certificates of attendance on the special subjects only and will be examined in these only for the dental diploma. First Professional Examination: The candidate must have attended the courses on Anatomy, Physiology, Chemistry, and Physics. The examination embraces Anatomy, Physiology, Chemistry, and Physics. The fee for those candidates who began study after Oct. 1st, 1896, is £5 5*s*. Second Examination: The candidate must have attended the remaining courses of the curriculum, must produce certificates showing that he is 21 years of age, and must pay a fee of £10 10*s*. The examination embraces Surgery, Medicine, Therapeutics, and the special subjects of Dental Anatomy and Physiology, Dental Surgery and Pathology, and Dental Mechanics with Dental Metallurgy, with a Practical Examination. Candidates who claim exemption from the First Dental Examination on the ground of having passed the First and Second Triple Qualification Examinations will, before being admitted to the Second Dental Examination, be required to pay the total fee of £15 15*s*. payable for the dental diploma. The fee payable by candidates who began study before Oct. 1st, 1896, shall be £10 10*s*., £4 4*s*. of which are payable on entering for the First Examination and £6 6*s*. on entering for the Second Examination.

Faculty of Physicians and Surgeons of Glasgow.—The regulations as to certificates, curriculum, number, and subjects of examinations, fees, &c., are in effect similar to those of the Royal College of Surgeons of Edinburgh, but embrace Dental Bacteriology. Special provision is made for candidates who intend to qualify both in Medicine and in Dentistry. Candidates can enter for the First Examination in three divisions, the first embracing Physics and Chemistry, the second Dental Metallurgy and Dental Mechanics and the third Anatomy and Physiology. There is also an examination in Practical Dentistry conducted in a dental hospital.

Royal College of Surgeons in Ireland.—All information concerning the licence in Dental Surgery may be obtained from the Registrar of the College, who will receive the applications of candidates for permission to be examined. The bank receipt for fees, together with all certificates, &c., are to be lodged with him at least seven days prior to the day fixed for the commencement of the examination. The Primary Dental Examinations commence on the second Monday in the months of February, May, and November. The Final Dental Examinations commence on the Thursdays immediately following the Primary Dental Examinations. Candidates are required to pass three examinations—viz., Preliminary (in occurring in all parts of " whilst under anæsthetics, he would consi recommending the appointment of a Royal ...quire into the matter.—Mr. GLADSTONE (by written answer) replied: My attention has not been called to the cases mentioned, except by my honourable friend's question. I have now received, through the Lord President of the Council, a reply from the General Medical Council. The Council does legislation to make practical training in the pulsory part of medical education, but it is the several licensing bodies as to how far they have given effect to the Council's recommendations on this subject.

WEDNESDAY, DEC. 16TH.

Tuberculosis Prevention (Ireland) Bill.

The House considered the Tuberculosis Prevention (Ireland) Bill on report.

Part I. of this measure provides for the notification of Tuberculosis in Ireland.

Mr. BIRRELL moved a new clause to make Part I. of the Bill adoptive. The clause was in the following terms:—

"1. This part of this Act shall extend to any urban or rural sanitary district in Ireland after the adoption thereof.

2. The sanitary authority of any such urban or rural sanitary district may, subject to the approval of any county council in which the district is situated, adopt this part of this Act by a resolution passed at a meeting of the authority.

3. Fourteen clear days at least before the meeting a summons to attend the meeting, specifying the business to be transacted, and signed by the clerk of the sanitary authority, shall be sent by post to, or delivered at the usual place of abode of, every member of the sanitary authority.

4. A resolution *adopting this part of this Act shall be published by* advertisement in local newspapers and by handbills."

This new clause was agreed to. Other amendments of less importance were also embodied in the Bill. When the report stage was completed the Bill was read a third time.

and the systematic courses in Dental subjects will be held in the School of Medicine of the University in Thoresby-place. The systematic instruction in the School of Dentistry will be given by the following:—Anatomy: Professor T. W. Griffith. Physiology: Professor de B. Birch. Pathology: Professor A. S. Grünbaum. Medicine: Professor A. G. Barrs. Surgery: *Professor H. Littlewood. Dental Surgery*: Mr. A. G. G. Plumley. Operative Dental Surgery: Mr. T. S. Carter. Dental Anatomy and Physiology: Mr. A. Alan Forty. Dental Mechanics: Mr. C. Rippon. Dental Metallurgy: Mr. W. Lowson. Dental Materia Medica: Mr. J. H. Gough. *The clinical instruction will be given in the* Dental Department of the Leeds Public Dispensary, which is recognised by the University and by the Royal College of Surgeons. Applications for the prospectus should be made to the Dean of the Faculty of Medicine.

University of Liverpool (Liverpool Dental Hospital and School of Dental Surgery).—The University grants a diploma in Dental Surgery (L.D.S.) and degrees in Dental Surgery (B.D.S. and M.D.S.). The courses of systematic instruction are given in the University buildings, five minutes' walk from the Dental Hospital. The two institutions are now closely associated and the management of the curriculum is in the hands of the Board of Dental Studies. At the Dental Hospital recent alterations have been made, and as it now stands this school offers advantages to students which are not excelled anywhere. The ground floor of the building contains the following: *Extraction room, with all needful appliances*; anæsthetic room, specially reserved, with every convenience; and large waiting-room for patients. The first floor has a large board-room and a very comfortable students' room set apart exclusively for the use of students. The whole top *floor of the building has been thrown into one fine, airy, and* well-ventilated operating room. This room will accommodate upwards of 30 operating chairs, which are of the "Morrison pattern," and each of which has a special electric light suspended before it. In the basement a very convenient workroom has been fitted up containing the necessary requirements, and there are commodious lavatories for students. A new Laboratory for practical mechanical work has also been constructed so as to meet the requirements of the curriculum. It is adequately furnished with all the modern appliances of a dental workshop. A skilled dental mechanic has been engaged and students are able to undertake at the hospital the whole of their training in Mechanical Dentistry. The times of the lecture at the University are arranged to meet the convenience of students, *thus allowing the maximum time for attendance upon Dental* Hospital practice. The staff of the hospital includes 12 honorary Dental Surgeons, a Demonstrator, two Anæsthetists, two House Surgeons, and a Curator. Fees for two years' hospital practice, £21. Apprenticeship.—A limited number of apprentices are admitted annually. Fees for three years, £105. Further information may be had from the Warden, Mr. W. H. Gilmour. The various medical and dental lectures are given at the University of Liverpool. The Anatomical Department has been removed to a new building, comprising a spacious *dissecting* room and a *museum* which contains an excellent collection of skulls illustrative of human and comparative dental anatomy. Fees: The composition fees are as follows: Diploma course (L.D.S.): Composition fee £58 10*s*., for diploma course of other licensing bodies £61 10*s*., payable in two equal instalments the first on entry, the second 12 months later. Two years' instruction in Mechanical Dentistry (pupilage) and two years' Dental Hospital Practice £100. *Degree course (B.D.S.): £67 10s.* for all lectures (including Chemistry, Physics, and Zoology) in three instalments. Two years' dental hospital, £21; general hospital practice, £10 10*s*.; three years' mechanical instruction (pupilage), £105.

University of Manchester.—In the University of Manchester the Dental Department forms an integral part of the Faculty of Medicine. This contains a series of laboratories, lecture rooms, and museums which will bear comparison with those of any other school in the kingdom, and the fullest opportunities for study are offered to students preparing for any of the professional examinations. Instruction adapted to the requirements of students preparing for the B.D.S. Degree and the Dental Diplomas of the University, the Royal College of Surgeons of England, and of other licensing bodies is given *during* the Winter and Summer sessions both at the University and at the Dental Hospital of Manchester in Oxford-street. The required general hospital practice is taken at the Manchester Royal Infirmary. Women students are admitted to the classes in the Dental Department and for them a separate laboratory for Practical Anatomy and common rooms are provided. The composition fee for candidates for the University degree of Bachelor of Dental Surgery is 60 guineas, payable in two equal instalments at the beginning of the first and third years of studentship. The composition fee for candidates for the University Diploma in Dentistry is 55 guineas, payable in two equal instalments at the beginning of the first and third years of studentship. The composition fee for candidates for the L.D.S. of England is 60 guineas, payable in two equal instalments at the beginning of the first and third years of studentship. Students who have already served their apprenticeship with a private practitioner, and who propose to complete the final portion of their attendance at the University and at an approved dental hospital, will be required to pay the composition fee in two equal instalments at the commencement of the first and second years of studentship. The payment of any of the above composition fees will entitle the student to attend all the classes in the following list which are required for their respective examinations. The composition fee does not include the hospital fees, the *examination* fees, the fee for the conferment of the degree or the diploma, the registration fee, nor the fees for chemicals and chemical apparatus (£1 1s.).

TEACHING INSTITUTIONS IN DENTISTRY.

LONDON.

Royal Dental Hospital of London and School of Dental Surgery, Leicester-square.—The school provides the special dental education required by the Royal College of Surgeons for the Licence in Dental Surgery. The general part of the curriculum may be taken at any general hospital. The hospital is open from 9 A.M. to 4 P.M., there being one staff for the morning and *another for the* afternoon of each day. Pupils are received for the mechanical training recognised by the curriculum. The demonstrators at the commencement of each session give a course of *lectures* on *Operative* Dental Surgery. The five house surgeoncies are held for six months each and are open to all qualified students. The lecturers, in addition to their lectures, give special demonstrations on the Microscopy of Dental Anatomy and Dental *Surgery. The lecturer on Dental* Mechanics also gives practical demonstrations in the mechanical laboratory. One Entrance Scholarship of the value of £20. The Saunders Scholarship awarded to second year students. The Storer Bennett Research Scholarship for Scientific Research in any branch of Dental Surgery, value *£50, is* awarded triennially. The Alfred Woodhouse Scholarship of £35 and the Robert Woodhouse Prize of £10 for Practical Dental Surgery. Prizes and certificates are awarded by the lecturers for the best examinations in the subjects of their respective courses, at the end of the summer and winter sessions. A prize of the value of 5 guineas is given by Messrs. Ash and Sons for the best essay on some surgical subject connected with Dental Surgery. Consulting *Physician*: Sir Richard Douglas Powell, Bart. Consulting Dental Surgeons: Mr. T. Arnold Rogers, Mr. Morton Smale, and Mr. C. S. Tomes, F.R.S. Dental Surgeons: Mr. J. F. Colyer, Mr. C. F. Rilot, Mr. W. H. Dolamore, Mr. G. Hern, Mr. J. G. *Turner, and Mr. N. G. Bennett. Assistant Dental* Surgeons: Mr. D. P. Gabell, Mr. A. Hopewell Smith, Mr. H. Austen, Mr. R. McKay, and Mr. W. W. James. Anæsthetists: Dr. Dudley Buxton, Dr. R. J. Probyn-Williams, and Mr. H. Hilliard. Demonstrators: Mr. A. L. Whitehouse, Mr. L. C. Ball, Mr. J. G. Atkinson Fairbank, Mr. F. Butler, Mr. G. H. Curtis, and Mr. H. C. Colyer. Lecturers:—Dental *Anatomy* and *Physiology (Human* and *Comparative)*: Mr. A. Hopewell *Smith. Dental Surgery* and *Pathology*: Mr. J. G. Turner. Operative Dental Surgery: Mr. W. H. Dol. Mechanical Dentistry: Mr. W. J. May. Metallurgy in its application to Dental Purposes: *Mr. P. Ellis* Richards. Dental Bacteriology: Mr. Howard Mummery. Dental Materia Medica: Mr. H. A. Austen. During the sessions the surgeons of the day will give demonstrations at stated hours. The house surgeons attend daily while the hospital is open. Fee for two years' *hospital practice* required by the curriculum, including lectures, £53 3*s*. in one payment, or £55 13*s*. in

al Diary for the ensuing Week.

EDITORIAL NOTICES

most important that communications relating to the
al business of THE LANCET should be addressed
ely "TO THE EDITOR," and not in any case to any
nan who may be supposed to be connected with the
al staff. It is urgently necessary that attention should
n to this notice.

pecially requested that early intelligence of local events
ing a medical interest, or which it is desirable to bring
ler the notice of the profession, may be sent direct to
office.

es, original articles, and reports should be written on
side of the paper only, AND WHEN ACCOMPANIED BY BLOCKS IT IS REQUESTED THAT THE NAME OF THE AUTHOR, AND IF POSSIBLE OF THE ARTICLE, SHOULD BE WRITTEN ON THE BLOCKS TO FACILITATE IDENTIFICATION.

Letters, whether intended for insertion or for private information, must be authenticated by the names and addresses of their writers—not necessarily for publication.

We cannot prescribe or recommend practitioners.

Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor."

Letters relating to the publication, sale and advertising departments of THE LANCET *should be addressed "To the Manager."*

We cannot undertake to return MSS. not used.

MANAGER'S NOTICES.

TO SUBSCRIBERS.

WILL Subscribers please note that only those subscriptions which are sent direct to the Proprietors of THE LANCET at their Offices, 423, Strand, London, W.C., are dealt with by them! Subscriptions paid to London or to local newsagents (with none of whom have the Proprietors any connexion whatever) do not reach THE LANCET Offices, and consequently inquiries concerning missing copies, &c., should be sent to the Agent to whom the subscription is paid, and *not* to THE LANCET Offices.

Subscribers, by sending their subscriptions direct to THE LANCET Offices, will insure regularity in the despatch of their Journals and an earlier delivery than the majority of Agents are able to effect.

THE COLONIAL AND FOREIGN EDITION (printed on thin paper) is published in time to catch the weekly Friday mails to all parts of the world.

The rates of subscriptions, post free, either from THE LANCET Offices or from Agents, are:—

FOR THE UNITED KINGDOM.		TO THE COLONIES AND ABROAD.	
One Year	£1 12 6	One Year	£1 14 8
Six Months	0 16 3	Six Months	0 17 4
Three Months	0 8 2	Three Months	0 8 8

Subscriptions (which may commence at any time) are payable in advance. Cheques and Post Office Orders (crossed "London and Westminster Bank, Westminster Branch") should be made payable to the Manager, Mr. CHARLES GOOD, THE LANCET Offices, 423, Strand, London, W.C.

TO COLONIAL AND FOREIGN SUBSCRIBERS.

SUBSCRIBERS ABROAD ARE PARTICULARLY REQUESTED TO NOTE THE RATES OF SUBSCRIPTIONS GIVEN ABOVE. It has come to the knowledge of the Manager that in some cases higher rates are being charged, on the plea that the heavy weight of THE LANCET necessitates additional postage above the ordinary rate allowed for in the terms of subscriptions. Any demand for increased rates, on this or on any other ground, should be resisted. The Proprietors of THE LANCET have for many years paid, and continue to pay, the whole of the heavy cost of postage on overweight foreign issues; and Agents are authorised to collect, and generally do so collect, from the Proprietors the cost of such extra postage.

The Manager will be pleased to forward copies direct from the Offices to places abroad at the above rates, whatever be the weight of any of the copies so supplied. Address—THE MANAGER, THE LANCET OFFICES, 423, STRAND, LONDON, ENGLAND.

The General Courses required for the Dental Diploma may be taken in the Medical School of the Royal Colleges of Physicians and Surgeons or in the University schools. The hospital attendance and clinical instruction are taken at the Royal Infirmary. The University, Medical Schools, and Royal Infirmary are within three minutes' walk of the Dental Hospital. The special courses are taken in the hospital. The Dental Hospital practice, extending over two years, affords a student ample opportunity for a full acquaintance with every branch of dentistry. The hospital admits a limited number of indentured pupils. They receive their instruction in Mechanical Dentistry concurrently with the general and special courses. A premium of 60 guineas is payable with each such pupil. The practice and lectures of the hospital are recognised by, and qualify for, all the Licensing Boards. For the special classes, both theoretical and practical, required by dental students the directors have secured the services of an efficient staff of dental officers and lecturers. There will also be a course of demonstrations in Mechanical Dentistry. Students will receive instruction in Practical Dental Mechanics under the mechanician. The cost of the hospital outfit of instruments is included in the Dental Hospital fee of £31 10*s*. The minimum cost of classes and Diploma for the whole course of dental instruction amounts to £90 7*s*. Those students who desire to take a Medical and Surgical Diploma in addition to the L.D.S. have in this school admirable facilities for so doing. The triple qualification of the Royal College of Physicians and Surgeons of Edinburgh and the Faculty of Physicians and Surgeons of Glasgow is recommended. The minimum cost of the Professional Education Triple Qualification and Licence in Dental Surgery amounts to £169 7*s*. The mechanical department is large and airy and furnished with all modern tools and appliances. The winter session commences Oct. 1st. The Museum is open to students for study. Further particulars can be obtained from the Dean, Mr. W. Guy.

Incorporated Glasgow Dental Hospital and School, 15, Dalhousie-street, Garnethill, Glasgow.—The winter session will begin in October and the lectures will be delivered as follows. In Dental Mechanics on Monday and Wednesday at 7 P.M., by Dr. Hugh McKay, and in Dental Metallurgy on Tuesday and Thursday at 7, by Mr. W. Bruce Hepburn, L.D.S. Fee for each of the above courses of lectures, £3 3*s*. The lectures and instruction at the Glasgow Dental Hospital and School are recognised by all the licensing bodies in the United Kingdom. The fees for two years' hospital practice are £15 15*s*. Intending students before commencing to attend the lectures or hospital practice must produce evidence of having passed the preliminary examination prescribed by the regulations of the General Medical Council for registration of dental students. The hospital is opened daily from 5 to 7 P.M. (Saturdays excepted). Students may only enrol during the months of April or October. Summer session begins in April.

Glasgow Royal Infirmary (Dental Department).—Mr. Wm. Taylor attends at the Royal Infirmary at 3 P.M. on Mondays, Wednesdays, and Saturdays, and gives a course of instruction in Dental Surgery on these days in summer. The following course in the curriculum can be taken at St. Mungo's College: Anatomy, six months; Practical Anatomy, nine months; Physiology, six months; Chemistry, six months; Practical Chemistry with Metallurgy, three months; Surgery, six months; Medicine, six months; Materia Medica, three months; Clinical Surgery, six months; Dental Surgery, six months, and attendance for two years on the dental department of the hospital. The attendance on the Dental Clinic is free to students of the hospital. The winter session opens Thursday, Oct. 15th.

Ancillary Scientific Institutions.

Imperial College of Science and Technology, London (with which is incorporated the Royal School of Mines, and of which the City and Guilds College is a Constituent College).—Mechanics and Mathematics: Professor J. Perry, F.R.S., and Dr. A. R. Willis. Biology: (Zoology) Professor Dendy (temporary) and Professor J. B. Farmer, M.A., F.R.S. (Botany). Chemistry: Professor W. A. Tilden, F.R.S., and Dr. M. O. Forster, F.R.S. Physics: Professor H. L. Callendar, F.R.S., Dr. W. Watson, F.R.S., and Mr. A. Fowler. Geology: Professor W. W. Watts, F.R.S., and Dr. Cullis. Metallurgy: Professor W. Gowland. Mining: Professor S. H. Cox. The College reopens on Tuesday, Oct. 6th, 1908. Communications should be addressed to the Secretary, Imperial College, South Kensington, S.W.

Electrical Standardizing, Testing, and Training Institution, Faraday House, 62–70, Southampton-row, W.C. —Principal, Hugh Erat Harrison, B.Sc. Lond. Instructor in Mathematics and Physics: Alexander Russell, D.Sc. Glasg., M.A. Cantab. Instructor in Chemistry: Mr. J. Thomas, B.Sc. Lond. Instructor in Mechanical Engineering: Mr. Walter H. Bell, A.M.Inst.C.E. This institution, in addition to its ordinary course of training in electrical engineering, which occupies four years, also arranges for special instruction in all branches of electricity either by private tuition or by a specially arranged course at the College or at the works of the companies with which it is associated. There are Entrance Scholarships of the value of 150 and 100 guineas. Particulars may be obtained on application to the Secretary, Mr. Howard Foulds, Faraday House, Southampton-row, W.C. Session begins Sept. 21st.

School of the Pharmaceutical Society of Great Britain.—Chemistry and Physics: Professor Arthur W. Crossley (Dean of the school). Botany: Mr. H. J. Jeffery, A.R.C.Sc. Pharmaceutics: Professor Greenish. The session commences on Wednesday, Sept. 30th. Medical students, or pupils intending to enter the medical profession, are admitted to the lectures and laboratory work in any or all the courses. Certificates of instruction in this school are received by the Conjoint Board of the Royal Colleges. Application for admission to the school, or for further information, may be made to the Registrar, 17, Bloomsbury-square, London, W.C.

Royal Sanitary Institute (with which is incorporated the Parkes Museum), Parkes Museum, Margaret-street, Regent-street, W.—The objects of the Royal Sanitary Institute are to promote the advancement of sanitary science in all or any of its branches and to diffuse knowledge relating thereto. It was founded in 1876 and incorporated in 1888. Sessional meetings are held in London and in various provincial centres from time to time for the reading of papers and for discussions upon subjects connected with sanitary science, and lectures and demonstrations are arranged for sanitary officers; in sanitary science as applied to buildings and public works, suitable for foremen of works, builders, and those engaged in the allied trades; for army officers and professional men on food and meat inspection; for meat inspectors; and for school teachers. Examinations are held in London, provincial, and colonial centres and certificates of competency in sanitary knowledge are granted. The Parkes Museum, which is maintained by the institute, contains a great variety of the most approved forms of apparatus and appliances relating to health and domestic comfort. Professors and teachers of hygiene are allowed the use of the museum for demonstrations to their students on application to the committee. The museum is open daily from 9.30 A.M. to 5.30 P.M. and on Mondays to 8 P.M. and is free of charge except when lectures or meetings are being held. There are also a large library of sanitary literature which contains, in addition to standard works on sanitary science, a collection of reports of medical officers of health over the whole country, and a reading room supplied with the principal sanitary periodicals, both home and foreign. The institute is under the patronage of the King, and the officers are: President, the Duke of Northumberland; chairman of council, Mr. H. D. Searles Wood, F.R.I.B.A.; treasurer, Mr. Thomas W. Cutler, F.R.I.B.A.; registrar, Mr. A. Wynter Blyth, M.R.C.S.; and secretary, Mr. E. White Wallis. The lecturers are Dr. J. Priestley, Dr. A. Wellesley Harris, Dr. E. J. Steegmann, Dr. E. Petronell Manby, Professor H. R. Kenwood, M.B., Professor A. Bostock Hill, M.D., M.Sc., Dr. P. Boobbyer, Dr. James Kerr, Colonel J. Lane Notter, R.A.M.C., Mr. J. Osborne Smith, F.R.I.B.A., Mr. W. C. Tyndale, M.Inst.C.E., Mr. Henry Adams, M.Inst.C.E., Mr. J. E. Worth, M.Inst.C.E., Mr. J. Wright Clarke, Major J. A. Meredith, F.R.C.V.S., Mr. James King, M.R.C.V.S. For members the annual subscription is £2 2*s*. and for associates £1 1*s*., but members and associates holding certain qualifications only pay half the ordinary rate of subscription.

The Royal Institute of Public Health.—The Royal Institute of Public Health, 37, Russell-square, W.C., was founded in the year 1886 with the object of obtaining the registration of public health diplomas and the further statutory requirement that all medical officers of health

Notes, Short Comments, and Answers to Correspondents.

THE TURVEY TREATMENT.

WE observe that the Turvey treatment is still alive and still possesses or states that it possesses the services of a highly-qualified English physician. The following is an advertisement which recently appeared in the *Morning Post*:—

> THE TURVEY TREATMENT for Home Cure of DRINK and DRUG HABITS. CONSULTING ROOMS open 10.30 to four. ADVICE FREE. Highly qualified English physician in attendance.—133 and 135, Regent-street, W. (side entrance), five minutes from Piccadilly-circus. Treatise sent post free. Telephone, 5,494 Gerrard.

It would be interesting to know the name of the highly qualified English physician associated with the treatment.

MNEMONICS.

To the Editor of THE LANCET.

SIR,—In THE LANCET of Dec. 12th you remark in reply to "Curious" that mnemonics in connexion with medicine (and anatomy) are best when they are home-made. One of the best I know is the following, which in a way "explains itself." It gives the order of the structures in the eyelid from without inwards: Skin O pal! ten (p)tar-mi-*con* (suggesting the word "ptarmigan")—i.e., skin, orbicularis (palpebrarum), palpebral ligament, tendon of the levator palpebræ, tarsal cartilage, Meibomian glands, conjunctiva. I know it was "home-made."

I am, Sir, yours faithfully,
HERBERT W. G. MACLEOD, M.D. Edin., M.R.C.P. Lond.
Upper Wimpole-street, W., Dec. 14th, 1908.

SUPERSTITION.

The Cure for the White Plague
and other disease given by GOD
to Man, 1490 B.C.; revealed to a
Woman, A.D. 1907.

WE have received, in common, no doubt, with many others, a booklet with this title announcing this marvellous revelation. The texts on which it is founded are from Exodus and Leviticus, and we leave it to our readers to search the Pentateuch for them. But if and when they are found we are sure that they will not perceive their application, for to do this requires the faith not only of a little child but of a little idiot, coupled with an ignorance of elementary physiology which in these days is remarkable.

CHANTECLAIR.

IN THE LANCET of June 6th we commented upon two caricatures published in an advertising periodical called *Chanteclair*. The caricatures in question purported to represent Professor Richet and Dr. Héricourt engaged in research. The pictures were such as might well have been treated by a rabid antivivisectionist as a representation of realities, and the fact that the two medical men concerned treated the publication with good humoured contempt made it all the more possible for the fanatics to say, "They do not deny this, therefore it must be true." The number for December now before us contains a brief biographical notice of Professor Gaucher who is, as is well known, an authority on syphilis and the mercurial treatment of the disease. He is represented by "Moloch," the caricaturist, in the act of administering a gluteal intra-muscular mercurial injection to a lady with a blue face—the cyanosis, we suppose, being caused by her position. The caricature might have come from the brush of Gilray, but manners have changed since his day, and coarseness is not nowadays synonymous with wit.

HEALTH MATTERS IN BARBADOS.

ACCORDING to the Blue-book of this colony for the year 1907–08, the estimated population is 194,518, but the figures are not considered to be trustworthy. During 1907 the birth-rate was 33·2 per 1000 of the estimated population, as against 37·2 for 1906 and 39·8 for 1905. The percentage of illegitimate births continues to be a high one, being 56·9 per cent. of the births recorded. The burials registered numbered 5236, which was less by 2330 than in the previous year. The death-rate per 1000 was 26·9. The death-rate of children of one year old and under was 302 per 1000. This heavy mortality seems to be due to improper feeding of infants, for which ignorance is partly responsible and partly circumstances of deeper origin. The matter has been under careful consideration and it is hoped that the circulation of carefully prepared instructions as to the proper treatment of infants will do something to mitigate the evil pending more radical measures. Towards the latter end of 1907 and the beginning of 1903 a few cases of yellow fever were reported, but these were of a somewhat abnormal type, and consequently there was some difference of opinion among medical men as to the correctness of the diagnosis.

The health of the island was otherwise excellent. There hospital in Barbados; it is situated in Bridgetown and i exclusively by the Government, although not dir Government control. 4489 persons were treated in pital during the year, of whom 355 died. 21,906 were treated during the same period. The number of patients in residence at the lunatic 359. During the year 14 were discharged as cured an relieved, while 53 died. In the lazaretto at the beginning inmates were in residence. During the year 14 new admitted. 20 died during the year. 55 patients anæsthetic leprosy, while 58 were tubercular. It has no practice to discharge patients because the disease is patients escaped to neighbouring colonies during the was repatriated and re-confined. As lepers are not gated unless they come on the rates, the above figures do exact idea of the prevalence of the disease in the island. lazaretto no leper can leave except by order of the Governor tive Committee.

WELLCOME'S PHOTOGRAPHIC EXPOSURE RECOR DIARY.

WE have just received the 1909 edition of this interesting pocket-book which contains information upon many connected with photography. Plates, exposure, develop printing, toning, fixing, and mounting are all hints are given. Exposure is especially considered, as correct is held to be the essence of success in photography. A ment called "Wellcome's Exposure Calculator" is the back cover of the book, and it is claimed for it that it correct exposure under any condition by one turn of Instructions are given for its use and the instrument is not to understand. The price of the book is 1*s*. net.

PORTABLE BUILDINGS FOR OPEN-AIR

THE success of the open-air treatment has made popular the shelter, the verandah, and the porch both for the treatmen and for purposes of health and pleasure in connexion dwelling-house. Structures of this kind, however, are than useless if they are not built of well-seasoned wood structed on right plans. We have recently had placed in the catalogue of Messrs. Boulton and Paul of Norwich. This also large importers of timber, which is stacked on their until it is thoroughly seasoned before employment in various structures. Among these are revolving shelters quite easily turned in any direction so as to take sunshine, and one measuring only 8 feet by 6 feet, 7 feet and 10 feet to ridge, struck us as being very useful. This gives room for two patients, allowing for a table between them, and is sold at the price of £20, but structure a little less artistic in shape and ap be obtained for £12 10*s*. Verandahs are made so that be purchased at so much (about 16*s*.) per foot, and having to the infinite varieties of measurement that may be wanted useful idea. The usual form of verandahs which covers a s ground floor may also be used as balconies on upper floors, are many institutions where the addition of such balc reasonable figure would be a very proper improvement. The also contains illustrations and ground plans of buildings which erected at very short notice, with pictures of certain such already in existence. Among these we noticed pictures of the little sanatorium which has been erected at Mundesley, the hospital buildings at Devonport constructed for the Gov and of the Alton, Hants, Hospital which was built as the the *Daily Mail* "Absent-Minded Beggar Fund." Examples of hospitals are also shown as well as temporary structures municipal authorities are sometimes called upon to erect ceptional occasions. The catalogue is in this way made into a book of reference.

◆

Semper paratus.—Our correspondent's question is too vaguely and deals with too complicated matters to be answered o Most bacilli are killed by exposure to the temperature of boiling (100° C.) for half an hour, but spores are much more resistant. heat of roasting" is too indefinite a term for anything to be defi laid down as to its bactericidal qualities.

China.—There will be no objection to our correspondent addressin official in question but if he prefers to wait until we can recei answer from our local representative we will submit the que for him.

COMMUNICATIONS not noticed in our present issue will receive att in our next.

During the week marked copies of the following newspa have been received:—*Manchester Guardian, Liverpool Post, News, Star, Yorkshire Post, Glasgow Herald, Pall Mall Ga Daily Chronicle, Hull Eastern Morning News, Sheffield W Telegraph, Daily Telegraph, Liverpool Mercury, Birmingham Irish Independent, Scotsman, Army and Navy Gazette, &c.*

désireux d'obtenir le diplôme d'etat: ils doivent tous produire le baccalauréat." The simplicity and clearness of this statement make translation unnecessary. This exclusive attitude was not, however, wholly maintained. While withdrawing nothing of the exclusiveness of 1896, the Minister could grant leave to foreigners to possess themselves of a formal academic medical degree which, while it entitled the possessor to call himself docteur en médecine de la Faculté de Paris (de Montpelier, Nancy, Bordeaux, Lille, Lyon, or Toulouse), gave him no right whatever to practise on French territory. To obtain this degree the postulant must formulate his request to the Minister on *papier timbré*, inclosing a copy of his birth certificate, his diplomas, and class certificates, formally translated. This honorary degree is readily obtained and from English candidates it is probable that an appearance in so-called "final" subjects would alone be required.

Up to Dec. 29th, 1906, it was possible to transform the university or academic diploma into a Government degree by becoming a naturalised French subject. On account of the large number of young Russian girls who married in France and thereby became French and claimed the State diploma it has been decided to insist upon the possession by foreigners of the *licence-ès sciences* before this transformation can be granted. The fees for this degree amount to between £60 and £70.

ITALY.

Some years ago the British and American consuls at the great centres of Italian population and commerce combined to form an estimate of the money brought annually into the kingdom and spent within its borders by the English-speaking world. That estimate, an approximate one necessarily, which they carefully checked by every qualifying consideration conceivable, amounted to £20,000,000 sterling, about one-third of Italy's whole revenue at that time. Since then the yearly influx of English and especially of American visitors has greatly increased, so that were a similar calculation to be made now the estimate would doubtless be still larger. This is a fact of great importance from whatever side it is contemplated, and it implies a large and continuous demand for English-speaking practitioners. It is true that of late years an active agitation, having for its object the expulsion of all foreign practitioners from the country, has been carried on by a section of the medical profession in Italy, but the movement has proved only partly successful, the public at large being well aware of the injury which the adoption of such a measure would inflict upon its interests. The British medical men and their American *confrères* form a prominent reason for Italy continually to attract that portion of the travelling public from which she derives so much of her annual revenue. There are therefore excellent reasons why every facility should be offered to them for exercising their calling freely in her cities and health resorts, and we may state at once that the regulations which still exist in Italy with respect to the foreign practitioner are most liberal and fair, it being open to anyone possessing a medical qualification recognised as legal in the country of its origin to engage in practice amongst the foreign visitors and residents within her borders. The restrictions ruling in Switzerland, France, and, indeed, nearly every other European country, do not exist in the Italian kingdom. The medical man's qualification, certified by ability to produce his diploma, is quite sufficient. He has, therefore, (*a*) no examination to pass; (*b*) no fees to pay; (*c*) no Government forms to comply with; and (*d*) requires no previous residence in the country as a "condition precedent" to practise. All the same it will be to his advantage to graduate at an Italian school—Rome, Turin, Pavia, Padua, Bologna, Siena, Pisa, indeed all Italian Universities, grant degrees to duly qualified practitioners who can pass the examination these Universities require. On the other hand, in a country compelled by its financial requirements to impose taxes in every possible direction the English-speaking practitioner has to pay the heavy income-tax ("ricchezza mobile" it is called) of nearly 13½ per cent., besides being liable to the comparatively mild "tassa di famiglia" (tax on domestic servants, &c.), levied on foreign and native residents alike.

As to the career Italy offers it is in some respects better, in other respects worse, than it was some years ago. It is better inasmuch as Italian medicine and surgery have greatly improved of late years, and the foreign practitioner, particularly in those cities which are the seat of medic schools, is not in danger, as he used to be, of getting out touch with the advance of the profession. Indeed, th British medical man may keep himself *au courant* with th latest accession to medical doctrine as conveniently in th Italian as in any other kingdom. By graduating at one o other of the many Italian schools he can obtain the *entrée* t the medical societies, the congresses (provincial and national), the hospitals, the class-rooms open to the native practitioners, and also become entitled to the reduced railway and steamboat fares conceded on occasion to all duly qualified Italians. Indeed, he is generally welcome to them on th ground of professional *fratellanza* (brotherhood), but th graduation above indicated gives him a right to what h would otherwise owe merely to courtesy. On the other hand, the career is less favourable than formerly on account of the larger number of English-speaking competitors whom it now attracts and who comprise not only Englishmen and Americans, but Swiss, Germans, and other nationalities as well. Their harvest (generally limited to three or four months of the "season") entails immense, almost excessive, activity, compensating the comparative idleness of the months before and after it. Upon this short period of remunerative work the practitioner must therefore rely to carry him through the entire year, and with heavy expenses to meet for housekeeping, house rent, servants' wages, taxes, &c., it becomes a serious matter for him when the "season," as often happens, turns out a poor one He may certainly be able to supplement his winter's income by taking up practice at one or other of the summer resorts, but such practices are difficult to find and with few exceptions are of little value. Failing this he will find nearly the whole summer on his hands, for it is useless to remain at his post during the hot season while his patients have all left to seek the cooler air of the Alps and the Tyrol or have returned to their own country. Nothing is then left for him but to follow their example and thus to incur the heavy expense of moving somewhere else with his whole family. Nevertheless, for a well-qualified man with sufficient private means to tide him over the first years, and who is possessed of good social introductions, there are always openings where he can still find a profitable *clientèle*, although his possible income at any of the smaller health or pleasure resorts will necessarily be limited.

One word of warning in conclusion. Let anyone who is tempted to buy a practice in Italy proceed with even more caution than he would in negotiating in his own country. In the first place, the foreign population of nearly all Italian towns is largely a floating one, composed chiefly of people who remain for but a few weeks, often for only a few days in one resort, and many of whom never come back again. The vendor of a practice in a place of this sort will have many patients on his books whom he cannot possibly introduce in any way to his successor, and a good many others whom he may introduce but who will never return to the locality, or at best do so only at long intervals, and can therefore form no permanent or profitable part of his successor's *clientèle*. His hold upon the practice is, in fact, of a peculiarly personal kind and cannot, in the nature of things, be easily transferred to another. Secondly, the purchaser himself must be a man fitted for this particular class of work, or he may discover too late that he cannot make it pay and that the capital which he has expended has been spent to no purpose. A similar remark is doubtless true with regard to all such transactions, but it applies with special force in the circumstances now under consideration, where the physician has to deal with patients of such varying types and diverse characteristics as are to be met with amongst the travelling public in an Italian health or pleasure resort. To achieve a full measure of success the foreign practitioner in Italy must not only be a man of good all-round attainments, conversant with all branches of his profession, but should be possessed of an unusual share of sympathy and tact, for the exercise of which he will have daily scope amongst patients on whom illness falls with peculiar sadness, alone, as they so often are, and helpless in a foreign land.

GERMANY.

Foreign diplomas are not legally recognised in Germany as entitling their holders to practise medicine, so that British medical men desiring to settle in that country have to attend all the classes and pass all the examinations. A

ical Diary for the ensuing Week.

RES, ADDRESSES, DEMONSTRATIONS, &c.

EDITORIAL NOTICES

most important that communications relating to the
al business of THE LANCET should be addressed
ely "TO THE EDITOR," and not in any case to any
nan who may be supposed to be connected with the
al staff. It is urgently necessary that attention should
en to this notice.

*specially requested that early intelligence of local events
ring a medical interest, or which it is desirable to bring
der the notice of the profession, may be sent direct to
s office.*

*es, original articles, and reports should be written on
e side of the paper only,* AND WHEN ACCOMPANIED BY BLOCKS IT IS REQUESTED THAT THE NAME OF THE AUTHOR, AND IF POSSIBLE OF THE ARTICLE, SHOULD BE WRITTEN ON THE BLOCKS TO FACILITATE IDENTIFICATION.

Letters, whether intended for insertion or for private information, must be authenticated by the names and addresses of their writers—not necessarily for publication.

We cannot prescribe or recommend practitioners.

Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor."

Letters relating to the publication, sale and advertising departments of THE LANCET *should be addressed "To the Manager."*

We cannot undertake to return MSS. not used.

MANAGER'S NOTICES.

TO SUBSCRIBERS.

WILL Subscribers please note that only those subscriptions which are sent direct to the Proprietors of THE LANCET at their Offices, 423, Strand, London, W.C., are dealt with by them! Subscriptions paid to London or to local newsagents (with none of whom have the Proprietors any connexion whatever) do not reach THE LANCET Offices, and consequently inquiries concerning missing copies, &c., should be sent to the Agent to whom the subscription is paid, and *not* to THE LANCET Offices.

Subscribers, by sending their subscriptions direct to THE LANCET Offices, will insure regularity in the despatch of their Journals and an earlier delivery than the majority of Agents are able to effect.

THE COLONIAL AND FOREIGN EDITION (printed on thin paper) is published in time to catch the weekly Friday mails to all parts of the world.

The rates of subscriptions, post free, either from THE LANCET Offices or from Agents, are:—

FOR THE UNITED KINGDOM.		TO THE COLONIES AND ABROAD.	
One Year	£1 12 6	One Year	£1 14 8
Six Months	0 16 3	Six Months	0 17 4
Three Months	0 8 2	Three Months	0 8 8

Subscriptions (which may commence at any time) are payable in advance. Cheques and Post Office Orders (crossed "London and Westminster Bank, Westminster Branch") should be made payable to the Manager, Mr. CHARLES GOOD, THE LANCET Offices, 423, Strand, London, W.C.

TO COLONIAL AND FOREIGN SUBSCRIBERS.

SUBSCRIBERS ABROAD ARE PARTICULARLY REQUESTED TO NOTE THE RATES OF SUBSCRIPTIONS GIVEN ABOVE. It has come to the knowledge of the Manager that in some cases higher rates are being charged, on the plea that the heavy weight of THE LANCET necessitates additional postage above the ordinary rate allowed for in the terms of subscriptions. Any demand for increased rates, on this or on any other ground, should be resisted. The Proprietors of THE LANCET have for many years paid, and continue to pay, the whole of the heavy cost of postage on overweight foreign issues; and Agents are authorised to collect, and generally do so collect, from the Proprietors the cost of such extra postage.

The Manager will be pleased to forward copies direct from the Offices to places abroad at the above rates, whatever be the weight of any of the copies so supplied. Address—THE MANAGER, THE LANCET OFFICES, 423, STRAND, LONDON, ENGLAND.

METEOROLOGICAL READINGS.

The only academical degree for medical men known in Denmark is the degree of M.D. It is granted exclusively by the University of Copenhagen, and only to those who have submitted to the faculty an original investigation of undoubted scientific value, the consequence being that only a comparatively small number of Danish practitioners possess the degree in contradistinction to what is customary, for example, in Germany. In fact, the Danish degree of M.D. must be considered as equal to the German title of *privat-docent* or the French title of *professeur agrégé*, as it authorises its possessor to teach publicly in the university.

The only portion of Danish territory where a foreign medical man is permitted to make use of his diploma are the Danish islands in the West Indies, the Governor being empowered to grant such permissions; but he is not likely to do so except during epidemics or when other abnormal conditions obtain.

NETHERLANDS.

A medical practitioner holding British qualifications cannot practise in the Netherlands without being also qualified in the Netherlands. For this purpose it is necessary to pass the medical examinations of one of the universities.

SWITZERLAND.

Foreign practitioners must pass the first, third, and fourth State Examinations. These examinations are held in either French (at Lausanne and Geneva) or German (at Bern, Basel, and Zürich). In addition to the British five years' curriculum practitioners would require one or two years' additional study. The examination fees amount to about £9.

SPAIN.

To practise in Spain or her colonies it is necessary for the holder of British qualifications to send his diplomas to the University of Madrid. After inquiries as to identity a diploma will be sent to the applicant who can then legally practise on the same conditions as a Spaniard—namely, the payment of certain duties.

PORTUGAL.

Holders of foreign diplomas must apply for examination at the schools of Lisbon or Oporto or the Faculty of Coimbra. The cost of the examination, including the diploma, is about £50. For the last examination the presentation of a *printed* dissertation is required.

TURKEY.

Every foreign medical practitioner desirous of settling in Turkey for the purpose of practising his profession must undergo the ordeal of the so-called "colloquium." This is a sort of professional examination very easy in itself but a source of annoyance and vexation to Europeans by the dilatory propensities of orientals and their habit of conducting business in an indolent and easy-going way. The "colloquium" itself takes about half an hour's time, whereas the preliminary steps and arrangements and the subsequent formalities necessary for the final obtainment of the medical permit lasts for weeks and even months. The "colloquium" must at the present time be passed either in French or Turkish without any interpreter, the choice of the language being left to the examinee. The possessor of a foreign diploma is tested, as a rule, in four subjects and the testing consists in three or four questions in each subject, which the candidate has to answer orally. It has not yet happened that a European physician failed to pass the "colloquium." The fee for it used to be about £8. Two or three years ago it was raised to £20. I am informed that this was done in order to increase the revenue of the rather inefficiently equipped Medical School at Haidar Pasha and to diminish the influx of the numerous medical men flocking to the Turkish metropolis from almost every country adjoining the Ottoman Empire. A far better means of effectively doing the latter would be to raise the rather low standard of the "colloquium." There are numbers of medical men in Constantinople and in other parts of Turkey whose qualification is doubtful. This is especially the case with regard to the so-called "surgical dentists."

RUSSIA.

The law relating to foreign medical practitioners desirous to practise in Russia is contained in the two following paragraphs of the *Vratchebny Ustav* or medical statute:—Section 93 (*a*): No one, whether a Russian subject or a foreigner, who has not a diploma or certificate from a university or from an Army Medical Academy, has the right to follow any branch of medical or veterinary practice in Russia; (*b*) foreign medical practitioners who wish to practise medicine in Russia must, without exception, know the Russian language. Section 94: Of foreign practitioners who shall be invited or who may come to Russia the right to decide which of them shall be permitted to free practice here and under what conditions is in the hands of the Medical Council of the Ministry of the Interior; some shall be permitted only after the usual examinations and consequent granting to them of a learned degree; others more distinguished after an oral examination in the Medical Council; lastly, others who have made a name in the scientific world by their writings or unusually successful practice, or who have occupied professorial chairs or other important medical appointments in other countries, may be permitted to practise without any examination, solely on the decision of the Medical Council, confirmed by the Minister of the Interior, as to the worthiness of such practitioners.[1] Previous residence in the country before practice would not be necessary except in the case of the first group mentioned, who would have to pass through the usual five years' course of a Russian medical curriculum. As to the prospects of a British practitioner in Russia, the country and the smaller towns can present no attraction to an English medical man, even if the fees obtainable would support him, which they would not. In the two capitals, Moscow and St. Petersburg, the field is wider. Competition is, however, great, fees are as a rule small, and bad debts many. The frequency of bad debts results from the unwritten law by which medical men do not send in accounts, but leave the patient to pay what he considers a suitable amount.

EGYPT.

Any person in possession of a diploma from a recognised school of medicine is allowed to practise his profession in Egypt after having presented his diploma to the Director-General of the Sanitary Department at Cairo for verification and paid a small fee of six piastres. From a recent report of the department it appears that the influx of medical men into Egypt of late years has been very great, so that it is difficult to understand how some are able to gain a livelihood from their profession. The effective control of diplomas which emanate from so many different foreign schools must be at times somewhat difficult, as the Public Health Department has no means of identifying the person who presents the diploma as the person who underwent the examinations which entitled him to it—e.g., there is nothing to prevent a person who has come into possession of a diploma by fraudulent means personifying the legitimate owner of the diploma and obtaining a licence to practise. It is true that in addition to the diploma a certificate of good conduct is necessary from the applicant's Consul before a licence to practise is granted, but in many cases the Consul finds himself in the same difficulty as the department with regard to ascertaining if the person in possession of the diploma is the rightful owner or not. We recommend any one of our readers who is attracted by the idea of medical practice in Egypt to obtain introductions to a resident in Egypt so that he may ascertain the chances of finding a remunerative opening and be provided with a witness to his identity. A knowledge of French or Italian and Arabic would be essential to any new-comer desirous of practising all the year round, for the tourist season only lasts from November to April.

JAPAN.

According to the regulations for medical licence "persons holding either diplomas of foreign universities, or medical schools, or foreign licences for practising medicine may be granted licences for practising medicine in Japan, without being subject to the usual medical examination, upon producing such diplomas or licences obtained in foreign countries to the satisfaction of the home authorities." English medical practitioners will therefore have no difficulty in obtaining a licence in Japan. The fee required for a licence is three yen (about 6*s.*) and with this exception there are no charges in respect of the medical licence. A local rate, which would be a small fee only, may have to be paid on opening a practice. A correspondent informs us that English practitioners in the foreign quarters of Japan are at some disadvantage for the reasons that the druggists, who are now nearly all Japanese, sell their drugs at a cheaper rate to native practitioners; and, moreover, living is cheaper for the native than for

Bapst, Asnières, Paris.

Secretary of the province. The application will be granted upon the approval of the Natal Medical Council and the fee for registration in Natal is one guinea.

Southern Rhodesia.—The admission fee for the practice of medicine in Rhodesia is £5 and application for the licence should be made to the Administrator of Rhodesia at Salisbury, Rhodesia. It would be well also to write to the Secretary of the British South Africa Company, London Wall, E.C.

Transvaal and the Orange River Colony.—The Transvaal Medical Council (Pretoria) and the Medical and Pharmacy Council of the Orange River Colony, Bloemfontein, grant a licence to practise on payment of £10 and £7 10*s.* respectively. Proof of registration by the General Medical Council of Great Britain must be supplied.

The Colonial Medical Service.

In the following countries there are medical departments regulated from the Colonial Office:—British Guiana, Jamaica, Trinidad, Tobago, Windward and Leeward Islands, British Honduras, Fiji, Ceylon, Straits Settlements, Federated Malay Straits, Hong-Kong, Mauritius, Seychelles, Gibraltar, St. Helena, Falkland Islands, Cyprus, Gambia, Sierra Leone, the Gold Coast, Northern and Southern Nigeria. The last four of the countries enumerated have been formed into the West African Medical Staff, a definite and well-organised service. The majority of the West Indian appointments involve medical charge of a district, including, as a rule, the care of a hospital, poorhouse, asylum, or other institution and free attendance on the aged and children. Passage money is granted to medical officers on first appointment, an annual vacation on full pay is given not exceeding three months in two years, and there are pensions, as a rule, where private practice is not permitted.

British Guiana.—There are 42 appointments. After two years' probation at a salary of £200 per annum, when quarters are provided but private practice is not allowed, the officer is appointed to the permanent staff with a salary of £400 per annum, rising by annual increments to £700. He can carry on private practice and receives a travelling allowance varying with the range of the duties from £100 to £150 per annum. The governor of the colony can also make appointments to the service in favour of local practitioners who act as supernumeraries upon temporary agreements.

Jamaica.—There are 54 appointments, mainly district appointments with private practice allowed. The salary paid by Government varies from £100 to £250 per annum, and in most cases is £200. Newcomers may be attached temporarily to the public hospital in Kingston, on a salary of £200 per annum, private practice not being allowed.

Trinidad.—In Trinidad there are 32 appointments. After two years' probation at a salary of £250 per annum, with furnished quarters, during which time they are usually attached to the Government hospital, the surgeons obtain district appointments, to which they are promoted as vacancies occur. The pay is £300 per annum, which is increased to £400 and upwards by various allowances for horse, house, or other purposes. These posts carry the right to private practice. After every five years an officer is given an additional personal allowance at the rate of £50 per annum. In future there will be few appointments in Trinidad, as the Government is aiming at the introduction of a system by which the work shall be performed by private practitioners under temporary contracts. In these three colonies there is a Civil Service Widows' and Orphans' Fund established by law, to which all medical officers must contribute 4 per cent. of their salaries.

Tobago.—In the island of Tobago there are three district appointments with salaries of £250 per annum, with quarters.

Windward Islands (Grenada, St. Lucia, St. Vincent).—The 22 appointments are, with few exceptions, district appointments with the right to private practice attached. The salaries paid by Government vary from £250 to £400, with allowances in certain cases.

Leeward Islands (Antigua, St. Christopher and Nevis, Dominica, Montserrat, Virgin Islands).—The 25 appointments are of the same nature as in the Windward Islands. The Secretary of State reserves the power to transfer a medical officer from one island to another in each case. The medical officers receive fees for successful vaccinations, post-mortem examinations, attendance and giving evidence at courts of justice, certificates of lunacy, and, in the larger islands, for burial certificates. They are also allowed private practice.

British Honduras.—There are four medical appointments, besides the principal post of colonial surgeon, in all of which private practice is allowed if it does not interfere with the public duties of the officer. The pay varies from £150 to £250. Two of the medical officers are also district commissioners and receive £300 for the combined posts of medical officer and district commissioner.

Fiji.—The medical service has recently been reorganised and officers appointed in future will be styled Government medical officers and receive a salary of £300, rising by annual increments of £10 to £400. They will be allowed private practice so far as is consistent with the proper discharge of their duty and will have charge of hospitals or of districts at the discretion of the authorities. The posts will be pensionable but an allowance in lieu of free quarters will not be pensionable. There will be ultimately 15 Government medical officers in addition to a senior medical officer (who at present receives £450 and £50 allowance for house rent) and a chief medical officer who will have £600 a year. Government medical officers will be given free quarters or an allowance in lieu thereof. This privilege is non-pensionable.

Ceylon.—The pay of the 36 sub-assistant colonial surgeons and eight other subordinate medical officers is at the rate of from Rs.900 to Rs.1600 per annum. There are nine deputy assistant colonial surgeons, with salaries at the rate of from Rs.1500 to Rs.2500. The 23 assistant colonial surgeons are paid at the rate of from Rs.3000 to Rs.5000 per annum and the six colonial surgeons and three other superior medical officers at a rate of from Rs.5500 to Rs.8000 per annum. The principal civil medical officer receives Rs.15,000, rising by annual increments of Rs.500 to Rs.18,000 per annum. As might be inferred from the scale of payment private practice is allowed to the subordinate officers but the colonial surgeons may take only consultation practice. The medical service of Ceylon is mainly recruited from among gentlemen born in the island but possessing British diplomas.

Straits Settlements.—Two house surgeons in the General Hospital, Singapore, and one in the General Hospital, Penang, receive £300, rising to £360, with free quarters. There are ten other subordinate posts in the medical department with salaries varying from £300 (rising to £360) to £780 (rising to £900). Some of these posts have free quarters attached and the holders of some are allowed private practice within limits. The salary of the principal civil medical officer is £1000.

Federated Malay States.—There are 18 district surgeons on salaries varying from £480 (rising to £540) to £720 (rising to £840). There are two assistants in the Institute for Medical Research on salaries of from £360 to £420. These posts are non-pensionable and the holders are eligible for appointment as district surgeons. Medical officers have no claim to private practice, which is limited, and the enjoyment of it is strictly subject to the permission of the Government.

Hong-Kong.—The principal civil medical officer receives £800 per annum, rising to £1000. There are two health officers of the port, four medical officers of health, and four assistant surgeons with salaries of £480 rising to £720. Mo of these appointments are pensionable. Private practice i not allowed and free quarters are only given in a few cases.

Mauritius.—There are 24 medical appointments in all. Of these 14 are minor appointments, with salaries varying from Rs.500 to Rs.1500 per annum. The other 10 appointments have salaries varying from Rs.2000 to Rs.9000. Fre quarters are not given in most cases and private practice i not allowed in the best appointments. The service is mainl recruited from among persons born on the island. Officer in the service of Mauritius are required annually to contribute 2 per cent. of their salaries towards their pensions.

Seychelles.—There are four medical appointments. Th Government medical officer receives Rs.4000. The assistan Government medical officers receive Rs.3000. The holders o these latter appointments have free quarters. Privat practice is allowed.

Gibraltar.—There is a surgeon to the Colonial Hospit receiving £275 and an assistant surgeon receiving £96, i each case with quarters, fuel and light allowance, ar permission for private practice. The surgeon of the hospita as medical officer of the civil prison and lunatic asylu ublic health work; or (b) in Scotland or Ireland the edical officer of health of a county or of one or more anitary districts having a population of not less than 0,000; or (c) a medical officer of health who is a teacher n the department of public health of a recognised medical chool; or (d) a sanitary staff officer of the Royal Army Medical Corps having charge of an army corps or district; r (e) in the British dominions outside the United Kingdom medical officer of health of a sanitary district having a opulation of not less than 30,000 who himself holds a egistrable diploma in public health. A certificate of an ssistant officer of health of a county or a large sanitary istrict may be accepted, provided the medical officer of health of a county or district consents to the assistant officer giving such instruction. Any candidate who shall produce evidence that he has himself held an appointment as medical officer of health under conditions not requiring the possession of a special sanitary diploma shall be exempt from this regulation. A candidate who produces evidence that he has himself held, for a period of not less than three years, an appointment as medical officer of health of a sanitary district within the British dominions and having a population of not less than 15,000 shall be exempt from the provision of paragraph (4). The provisions as to previous study shall not apply to medical practitioners registered, or entitled to be registered, on or before Jan. 1st, 1890.

The First Part of the examination will comprise (*a*) a written paper of three hours in Chemistry and Physics; (*b*) a three hours' practical and *viva voce* examination in Chemistry and Physics. The Written Examination: the subjects will be: Air (Examination, Recognition and Determination of Impurities): Water (Rainfall. Sources and Characters of Waters. Purification and Softening, Methods of Analysis, Distribution and Supply); Soils; Ventilation and Warming; Removal and Disposal of Sewage, House Refuse, Trade Refuse; Offensive Trades in their Chemical and Physical Aspects; Disinfectants; and the Examination of Foods by Chemical and Microscopical Methods. The Practical Examination: Candidates will be expected to exhibit a practical acquaintance with the ordinary methods of analysis and examination used in investigations concerning the subjects of the Written Examination.

The Second Part of the examination will consist of the following parts:—(*a*) Two written papers, each of three hours, dealing with General Hygiene (including Sanitary Engineering, Vital Statistics, and the Laws relating to Public Health); (*b*) a practical and *viva voce* examination in General Hygiene; (*c*) a written paper of three hours in Pathology and Bacteriology; and (*d*) a three hours' practical and *viva voce* examination in Pathology and Bacteriology. The subjects of these examinations will be as follows:—General Hygiene.—The Written Examination: The construction, drainage, heating, and ventilation of dwellings, schools, hospitals, and other similar buildings; the general sanitation of villages and towns; influences which exercise or threaten to exercise an injurious effect on health and physical development; the etiology, symptoms, and methods of prevention of infectious and other preventable disease; the effects of food, season, soil, and climate upon health and disease; dangerous and offensive trades; the inspection of food; the principles and methods of Vital Statistics: the laws, statutes, memoranda, &c., relating to Public Health. The Practical and *viva voce* Examination: Candidates will be required to show a practical knowledge of outdoor sanitary work. Pathology.—The Written Examination: The general pathology of infection by any organism (including a general knowledge of parasitology and helminthology), immunity, the principles of prophylactic and curative inoculations, serum therapeutics; the special pathological characters of the common human infections; the pathology of the diseases of animals transmissible to man; the conditions affecting the existence of infective agents outside the animal body; the pathology of diseases dependent on occupation. The Practical *viva voce* Examination: Candidates will be expected (*a*) to be able to demonstrate the existence of infective agents in pathological material; (*b*) to recognise cultures of the ordinary pathogenetic bacteria; (*c*) to exhibit a knowledge of the ordinary methods of bacteriological investigation, and of the special methods applicable to the examination of air, water, food, soil, and sewage; (*d*) to be familiar with the appearances presented by food which for bacteriological reasons is considered unfit for consumption.

Candidates in Part I. of the examination will be required to produce a certificate (1) of Laboratory Work in Chemistry as applied to Hygiene.

Candidates in Part II. will produce the following further certificates: (2) of a Practical Knowledge of the Duties, Routine and Special, of Public Health Administration; (3) of having had Practical Instruction in Bacteriology, and the Pathology of the Diseases of Animals transmissible to Man; and (4) of having attended the practice of a Hospital for Infectious Diseases at which opportunities are afforded for the study of the Methods of Administration. The courses of instruction in Chemistry applied to Hygiene and in Pathology and Bacteriology may be taken in the laboratories of any University in the United Kingdom, of any school of the University of London, of the Royal Army Medical College, of University College, Bristol, of any extramural school in Edinburgh, of Anderson's College, Glasgow, The Royal Institute of Public Health, and in any such other laboratory as may, in the case of any particular candidate, be approved of by the Regius Professor of Medicine. In the cases of certificates (2) and (4), the certificates shall be given in such form as shall satisfy the secretary to the Boards of Faculties that the candidate has conformed to the rules of the General Medical Council. The names of candidates must be sent to the Assistant Registrar of the University, Clarendon Building, Oxford, to whom applications for any further information should be addressed.

University of Cambridge.—Two examinations in so much of State Medicine as is comprised in the functions of medical officers of health will be held during the year 1908-9 in Cambridge. Each examination will consist of two parts. Part I. will begin on the first Wednesday in April and October respectively; Part II. will begin on the Monday following in April and October respectively; and each part will end on the following Thursday. Any person whose name is on the Medical Register is admissible as a candidate for this examination provided (1) a period of not less than twelve months shall have elapsed between the attainment of registrable qualification and the time when he presents himself for either part of the examination; (2) he produce evidence of having, after obtaining a registrable qualification, attended during three months the practice of a hospital for infectious diseases at which opportunities are afforded for the study of methods of administration; (3) he produce evidence of having, after obtaining a registrable qualification, attended during a period of six months on one or more courses, approved by the Syndicate, of practical laboratory instruction in Chemistry, Bacteriology, and the Pathology of those diseases of animals that are transmissible to man; and (4) he produce evidence of having, after obtaining a registrable qualification, for six months (of which at least three months shall be distinct and separate from the period of laboratory instruction) been associated day by day in the duty, routine and special, of public health administration under the supervision of: (*a*) in England and Wales either the medical officer of health of a county or of a single sanitary district having a population of not less than 50,000 or a medical officer of health devoting his whole time to public health work; or (*b*) in Scotland or Ireland the medical officer of health of a county or of one or more sanitary districts having a population of not less than 30,000; or (*c*) a medical officer of health who is a teacher in the department of public health of a recognised medical school; or (*d*) a sanitary staff officer of the Royal Army Medical Corps having charge of an army corps or district; or (*e*) in the British dominions outside the United Kingdom a medical officer of health of a sanitary district having a population of not less than 30,000 who himself holds a registrable diploma in public health. A certificate of an assistant officer of health of a county or a large sanitary district may be accepted, provided the medical officer of health of a county or district consents to the assistant officer giving such instruction. Any candidate who shall produce evidence that he has himself held an appointment as medical officer of health under conditions not requiring the possession of a special sanitary diploma shall be exempt from this regulation. A candidate who produces evidence that he has himself held, for a period of not less than three years, an appointment as medical officer of health of a sanitary district within the British dominions and having a population of not less than 15,000 shall be exempt from the provisions of paragraph (4). The provisions as to previous study shall not apply to medical practitioners registered, or entitled to be registered, on or before Jan. 1st, 1890.

OUR CURRENT NUMBER

Being almost exclusively devoted to information especially interesting to Students we are necessarily compelled to defer the publication of communications on other important subjects.

We tender our best thanks to those gentlemen who have at considerable personal trouble kindly supplied us with the returns and prospectuses upon which the information given in this Students' Number of THE LANCET *relative to the various medical examining bodies, hospitals, and medical schools of the United Kingdom is based. We regret that in some cases, however, owing to proofs having been either not returned at all or too late, certain inaccuracies may be found.*

TO ADVERTISERS.

Owing to the pressure on our advertisement columns this week some announcements have unavoidably been held over.

THE LANCET can be obtain[illegible]

may present themselves for Parts I. and II. separately or at the same time, provided that no candidate be admitted to Part II. unless he has already passed in Part I. No candidate's name will be published until he has satisfied the examiners in both parts of the examination. The fee for each part is £5 5*s.* and must be paid on or before July 1st in each year. For any subsequent examination in the same part the fee will be £3 3*s.* Every candidate who has passed both parts of the examination to the satisfaction of the examiners, and who is legally registered, will receive a Diploma in Public Health. The examinations will begin about the end of March and the middle of July in each year.

University of Birmingham.—The University grants a degree of B.Sc. in Public Health and also a Diploma in the *same subject on the following conditions*: Graduates in Medicine of this University may become candidates for the degree of Bachelor of Science in Public Health, by conforming to all the requirements laid down for candidates for the Diploma in Public Health, except that after graduating in Medicine all courses of study must be taken out in the University and they must, in addition, have attended a three months' course of Geology in the University. The following are the regulations for Diploma in Public Health (general conditions):—1. All candidates must be registered under the Medical Act. 2. The examinations will be held in the months of March and June and will consist of two parts. No candidate will be allowed to pass Part II. until he has passed Part I. 3. Candidates may enter for Parts I. and II. separately or at the same time. 4. The examination in each part will be written, oral, and practical. 5. Candidates intending to present themselves for either part of the examination must give notice in writing to the registrar of the University on the date prescribed in the calendar. 6. The fee for each part of the examination is £2. Admission fee to degree or diploma, £6. The conditions of admission to the examinations are identical with those *recently approved* by the General Medical Council.

Officers of the Royal Army Medical Corps who have studied Chemistry and Bacteriology at the Staff College and pursued the further course of study approved by the General Medical Council in December, 1902, will be admitted to the Examination for the Diploma in Public Health, whether they have previously been students of the Birmingham School or not.

University of Liverpool.—The University grants a Diploma in Public Health and every facility is *afforded for training* in Sanitary Science and State Medicine. The curriculum for the various D.P.H. Examinations demands (1) a six months' course of practical instruction in Sanitary Science; (2) a six months' course of laboratory instruction in Chemistry and Bacteriology; and (3) practical instruction in Infectious Diseases. Fees.—Chemistry, £5 5*s.*; Bacteriology, £5 5*s.*; Practical Sanitation, £25; Tutorial Classes, £7 7*s.*; Infectious Diseases, £3 3*s.* The courses may be taken out at any time and students are allowed to work daily in the laboratories.

University of Leeds.—The University grants a Diploma in Public Health and every facility is afforded *for training in* Sanitary Science and State Medicine. The examination, which is held twice in each year—*namely*, in July and December—is in two parts, and is written, oral, and practical. Candidates, before entering for the first part of the examination, must have held for not less than 12 months a registrable qualification in Medicine, Surgery, and Midwifery and must present satisfactory certificates (1) *of* having attended an approved course of instruction in Public Health in the University, or in a college or medical school recognised for this purpose by the University; (2) of having attended, after obtaining a registrable qualification, during at least six months practical instruction in laboratories approved by the University, the courses including Chemistry as applied to Public Health, Bacteriology, and the Pathology of those *diseases* of animals which are communicable from animals to man. Candidates before entering *the second* part of the examination must present certficates (3) of having, after obtaining a registrable qualification, attended during not less than three months the clinical and administrative practice of a hospital for infectious diseases approved by the University; (4) of having, after obtaining a registrable qualification, during six months (of which at least three months shall be distinct and separate from the period of laboratory instruction required under 2), been diligently engaged in acquiring a knowledge of the duties, routine and special, of Public Health administration under the supervision of (*a*) the medical officer of health of a county or of a single sanitary district having a population of not less than 50,000, or (*b*) a medical officer of health devoting his whole time to Public Health work, or (*c*) a medical officer of health who is also a teacher in the Department of Public Health of a recognised medical school, or (*d*) a sanitary staff officer of the Royal Army Medical Corps having charge of an Army Corps, district, or command recognised for the purpose by the General Medical Council, *or* of having attended during three months as required above, and during three months after obtaining a registrable qualification, having attended a course or courses of instruction, approved by the University, in subjects bearing on Public Health Administration. Candidates may present themselves for Parts I. and II. separately or at the same time, provided that no candidate be allowed to pass in Part II. unless he has already passed in Part I. No candidate's name will be published until he has satisfied the examiners in both parts of the examination. Fees—The fee for each part is £5 5*s.*, and must be paid at least 14 days before the commencement of the examination. For any subsequent examination in the same part the fee will be £3 3*s.* Every candidate who has passed both parts of the examination and who is legally registered will receive a Diploma in Public Health. Medical practitioners registered or entitled to be registered on or before Jan. 1st, 1890, may be exempted from producing the above required certificates of study.

University of Sheffield.—This University grants a Diploma in Public Health and courses of instruction have been arranged for it. These qualify for the Cambridge University Diploma, for that given by the Conjoint Board of England, and for the degree of M.D. in State Medicine of the University of London.

University of Edinburgh.—Two degrees in Science in the Department of Public Health are conferred by the University of Edinburgh, viz., Bachelor of Science in Public Health and Doctor of Science in Public Health. Candidates for the degree of B.Sc. in Public Health must be graduates in Medicine of a University of the United Kingdom, or of some other University recognised for the purpose, and must pass two examinations, for the first of which they must, after graduation in Medicine, have worked for at least 20 hours per week during a period of not less than eight months, of which at least five consecutive months must be in the Public Health Laboratory of the University of Edinburgh and the remainder either there or in a laboratory recognised by that University; they must also have attended courses of instruction in Physics and Geology in some Scottish University. Candidates are not admitted to the Second Examination sooner than six months after having passed the First Examination, nor sooner than 18 months after having taken their degree in Medicine, and they must have attended two separate courses in Public Health in some University of the United Kingdom or in such medical school or Indian, Colonial, or Foreign University as may be approved for the purpose by Edinburgh University, each course consisting of 40 lectures at least; one of which courses shall deal with medicine and the other with engineering, each in its relation to public health. They must also give evidence that, subsequent to graduation in medicine, (1) they have during three months, which must be separate and distinct from the period of laboratory instruction, been diligently engaged in acquiring a practical knowledge of the duties, routine and special, of Public Health administration under the supervision of (*a*) a medical officer of health *recognised* for this purpose by the General Medical Council; (*b*) a sanitary staff officer of the *Royal Army Medical* Corps, having charge of an army corps, district, or command, recognised for this purpose by the *General Medical Council*; (2) that they have attended during three months the practice of a hospital for infectious disease, at which opportunities are afforded for the study of methods of administration; and (3) that they have had three months' instruction in mensuration and drawing. The subjects of examination include Laboratory work, Physics, Geology, Medicine in its application to Public Health, Sanitation, Sanitary Law, and Vital Statistics. Graduates who have held the degree of B.Sc. in Public Health from the University of Edinburgh for a term of five years may offer themselves for the degree of D.Sc. in Public Health in that University. They must then present a Thesis and pass an examination in Public however, never felt well. He was done up every night. He frequently had cramps in the legs and once or twice vomited dark green stuff. On May 19th he went home feeling very ill. He vomited and was very sick. He was dizzy, "light-headed and raving." He had pains in the head and limbs, and his urine was "like porter." His skin and eyes were much yellower than usual. This condition continued until he was sent into the infirmary on May 25th. After admission he showed no sign of improvement but each day the jaundice got deeper; the rambling and excitement were more marked. He became comatose and died on May 29th. The blood was examined by Dr. R. H. Walton, the senior house surgeon, who found the number of red cells and the amount of hæmoglobin normal.

Necropsy.—The post-mortem examination revealed several unusual features. The yellowness of the hands produced by contact with the bi-nitro compounds had not worn off, although the lad had been away from the work over four weeks. His gums were greenish-yellow and his palate had a yellow discolouration. On the lower costal cartilages on both sides were minute ecchymoses. The heart weighed 10 ounces and was pale and flabby. The colour of the blood was darker than usual. The liver weighed one and three-quarter pounds. It was rather soft in consistence and there was grey mottling on the upper surface of the right lobe. It was generally paler, especially the right lobe. On the under surface were several small paler areas, apparently fatty. On section, the whole of the interior had a peculiar yellowish-green mottling and appeared to be fatty. The liver substance was very friable, easily breaking down. The gall-bladder contained about six ounces of dark thick bile. The spleen weighed five and three-quarter ounces; it was more mottled in appearance than usual. The kidneys each weighed seven ounces; they were mottled, pale, and fatty. The mesenteric glands were enlarged and dark. On the mucous membrane of the intestines and the bladder were numerous minute ecchymoses. None of the organs were bile stained. Samples of the urine were sent to the Clinical Research Association who reported that they could find no trace of nitrobenzene nor could they find leucin or tyrosin or bile. The brown discolouration they attributed to the presence of a marked excess of indican. At the inquest evidence was given to show that the lad had worked amongst various bi- and tri-nitro compounds (bi-nitrobenzene, bi-nitrotoluol, and tri-nitrotoluol). Specimens of the liver and kidney and samples of the blood and urine were forwarded to Dr. W. Malden, Pathological Laboratory, Cambridge, who kindly sent the following report:—

Report on Specimens from the Patient.

Liver.—Deep yellow mottling round the bile-ducts; some large patches resembling acute yellow atrophy. Specimens too much macerated to cut sections from. Liver contains no excess of iron.

Blood.—Dark purple-brown colour. Spectroscopically gives band of met-hæmoglobin. Microscopically, differential leucocyte count per cent.: eosinophils, 1; polymorphonuclears, 50; large mononuclears, 5·5; lymphocytes, 43; mast, 0; nucleated red cells, 4 seen; myelocyte, 1. Great variations in size of red corpuscles. Some poikilocytes. A fair number of basophil reds and some polychromatophils.

Urine.—Rich brown, clear. Reaction faintly acid. Specific gravity, 1020 at 60° F.; albumin, distinct trace; sugar, none; bile, slight trace; free urobilin, considerable quantity chemically and spectroscopically; free di-nitrobenzol, none. Microscopically, much epithelial débris, flat, squamous, cylindrical, and goblet cells. Casts, a few epithelial casts. Blood and pus cells, a few.

Opinion.—In my opinion this case is undoubtedly one of chronic poisoning by some body of the nitrobenzene series. The clinical history is clearly in favour of this diagnosis. History of three months' work in chemical manufacture of di-nitrobenzol and other allied compounds. Twice off work during that time from symptoms of poisoning. State on admission to hospital: cyanosis, vomiting, jaundice, dark urine, dyspnœa.

Post-mortem appearances.—Liver resembling acute yellow atrophy. Heart pale and fatty. Intestines ecchymoses. Kidneys enlarged and fatty degeneration. The specimens I have examined confirm the diagnosis. The blood and urine are most characteristic. The only points which are not in favour of bi-nitrobenzol poisoning are these: 1. There was no anæmia (red corpuscles counted normal). 2. There was no increase of iron in the liver. These, however, cannot outweigh the balance of probability in favour of bi-nitrobenzol poisoning as shown by all the other appearances.'

WALTER MALDEN, M.D.

Remarks.—So far as I know, no case exactly resembling this has been described before, but there can, I think, be no doubt about the diagnosis. The only other thing that it could be is ordinary acute yellow atrophy. Probably the hepatic degeneration closely resembled that which takes place in this disease but that it was acute yellow atrophy and nothing more is rendered unlikely by the following facts. In acute yellow atrophy the gall-bladder is empty. In this case it contained six ounces of bile. In acute yellow atrophy many of the organs are bile-stained. There was no bile-staining at all. In acute yellow atrophy there is almost invariably leucin or tyrosin or both in the urine. In this case these were both absent. Besides, as Dr. Malden points out, the clinical history, the history of work amongst bi-nitro compounds, the fact that he had suffered on three previous occasions from acute bi-nitrobenzol poisoning all point to the probability of the case being one of chronic bi-nitrobenzene poisoning.

Huddersfield.

A CASE OF FOREIGN BODY IN THE LEFT BRONCHUS.

By H. A. MOFFAT, F.R.C.S. ENG.

THE patient in this case was a policeman, about 35 years of age, whose previous medical history was unimportant. I first saw him on May 29th, 1908, when he told me that six days previously he went to sleep with a piece of chewing gum in his mouth. He woke up with a fit of violent coughing and with some shortness of breath and he found that the gum was gone. For a day he thought nothing of it, but as the cough persisted he saw his medical attendant; though advised to go off duty he refused to do so. The cough persisted, there was wheezing in his chest, and he was short of breath. There was pain on the right side over the second intercostal space. On the next day he was shivering and feverish. A troublesome cough with expectoration of unpleasant tasting muco-pus persisted; he was short of breath. On the 29th he was sent to me.

The patient was a well-developed and well-nourished man. There was a strained, anxious look about his face, his breathing was slightly laboured, and his lips and ears had a bluish tint; he had a frequent clanging cough. There was audible wheezing. The temperature was normal. The larynx and vocal cords were normal. The right side of the chest moved a little less freely than the left; there was no loss of resonance; vocal fremitus was normal. The air entered well all over. A loud rhonchus was heard at the end of inspiration and of expiration all over the chest, but was loudest on the right side just above and inside the right nipple. The voice sounds were normal. I found that a piece of chewing gum like the one which he had lost gave no shadow with the x rays. The patient said that he had often chewed a piece for two days without any appreciable diminution. Apparently the composition is a little pepsin, sugar with peppermint, with guttapercha, which forms the great bulk of the gum.

I advised the patient to go into hospital, but it was not until the next day that arrangements were made. He was admitted just after a rigor and had a temperature of 103° F. Just after admission he vomited; in the vomit were about two ounces of thick muco-pus. He was put on expectorants and a kettle was kept going, as I decided to wait and to see if the temperature would go down. On the 31st the temperature had fallen and he felt better; the slight dyspnœa and cough were unchanged. The rhonchus was heard only occasionally, and then only on the right side below the right nipple; the percussion note in the right axilla was a little flat. On June 1st there was no change; the temperature ranged from 99° to 100°. I advised a tracheotomy and a search from the wound, but he wished to put this off, having an idea that the gum would disintegrate; he had coughed up a piece of about the size of a pin's head. In the afternoon he had an attack of dyspnœa, transmissible to man; and (2) during six months practically study outdoor sanitary work under a medical officer of health and shall as an additional requirement attend a hospital for infectious diseases. Candidates are examined on four days, commencing on the first Monday of February, May, and November. Each candidate must return his name to the secretary of the Committee of Management under the Conjoint Scheme two weeks before the examination, and lodge with him a testimonial of character from a Fellow of either of the Colleges, or of the Royal Colleges of Physicians or Surgeons of London or Edinburgh. The fee for the examination is £10 10*s.* The examination for the Diploma in Public Health comprises the following subjects:—Hygiene, Chemistry, Meteorology and Climatology, Engineering, Vital Statistics, Sanitary Law, and Bacteriology. For further particulars apply to Alfred Miller, Secretary, Committee of Management; Office, Royal College of Physicians, Dublin.

DENTAL SURGERY.

ANYONE who is on the Medical Register is entitled to practise as a dentist, although he cannot register as such without the special licence; but it is of eminent advantage to take the L.D.S., otherwise few dental appointments at general or special hospitals or dispensaries are available, and, what is still more important, the manual dexterity requisite for the successful practice of dentistry can only be gained by long and careful training; and, this having been attained, it is but little trouble to pass the special examinations. The subjects beyond those included in the general qualification are—Dental Anatomy and Physiology (Human and Comparative), one course; a separate course of Dental Histology, including the preparation of microscopical sections; *Dental* Surgery, one course; a separate course of Practical Dental Surgery; a course of not less than five lectures on the Surgery of the Mouth; Dental Mechanics, *one course; a course* of Practical Dental Mechanics, including the manufacture and adjustment of six dentures and six crowns; Dental Metallurgy, one course; a course of Practical Dental Metallurgy; Practice of Dental Surgery at a recognised school, two years, and a certificate of having been engaged during a period of not less than two years in acquiring a knowledge of Dental Mechanics (this may be obtained by *apprenticeship to a duly qualified* dental practitioner or in the mechanical department of a recognised dental hospital). The Dental Schools in London are the Royal Dental Hospital of London, the National Dental Hospital and College, and Guy's Hospital Dental School. Most of the large provincial towns have now dental hospitals. A convenient arrangement by which the M.R.C.S., L.R.C.P., and L.D.S. *can be taken* is as follows:—The Preliminary Examination in General Education having been passed the student should commence his mechanical training *at a dental school* or with a qualified dentist and register as a dental and medical student. (This instruction, however, may be taken prior to the date of registration as a *dental student.*) During the mechanical tuition the student should receive instruction in Chemistry and Physics, *together with Biology*, and should pass the First Professional Examination for the Conjoint Diploma during his first *year. He should then* obtain instruction in Pharmacy and, having passed the examination, should complete his work for the *First* Professional Dental Examination and pass this at the end of his second year. On the completion of the mechanical training the student should join the general and dental hospitals and at the expiration of 18 *months* at the general hospital should pass the Second Examination for the *Conjoint Diploma. The* Final Examination for the *L.D.S.* can be taken at the end of two years from joining the hospital. The student during these two years will *have* been attending simultaneously both the general and dental hospitals. During the remainder of his time he should devote himself to Surgery, Medicine, Midwifery, &c., in which subjects he may be examined at the expiration of the *required* time from the passing of the Second Examination. When time is not a great object, a better course is to join *only* the general hospital at the completion of the mechanical tuition, and complete the Second Examination for the Conjoint Diploma and also his "Dressing" and "Clerking" appointments before commencing his surgical training at the Dental Hospital. The best course, however, is entirely to finish the curriculum for the M.R.C.S. and L.R.C.P. and then take the special Dental work. The regulations for the Dental Licence of the Royal Colleges of Ireland and Edinburgh and of the Faculty of Physicians and Surgeons of Glasgow are very similar to those of the English College. The L.D.S. can also be obtained alone.

The Registration of Dental Students is carried on at the Medical Council Office in London in the same manner as the existing registration of medical students, and subject to the same regulations as regards Preliminary Examinations. Candidates for a diploma in Dental Surgery must produce certificates of having been engaged during four years in professional studies and of having received two years' instruction in mechanical dentistry. The two years of instruction in mechanical dentistry, or any part of them, may be taken by the dental student either before or after his registration as a student, but no portion of such mechanical instruction will be counted as one of the four years of professional study unless taken after registration.

It is now necessary for anyone practising Dental Surgery in this country to be on the Register and no foreign qualifications are admitted.

The Royal College of Surgeons of England grants a diploma in Dental Surgery under the following regulations, which apply to all candidates who have registered as dental students after Jan. 1st, 1897. Candidates are required to pass three examinations: the Preliminary Science Examination, the First Professional Examination, and the Second Professional Examination. I. Preliminary Science Examination.—Before admission to this examination the candidate must produce a certificate of having received instruction (which may be taken prior to the date of registration as a dental student) at a recognised institution in Chemistry, Physics, and Practical Chemistry. The examination consists of these subjects and is identical with Part I. of the First Examination of the Examining Board in England. II. The First Professional Examination.—The candidate must produce the following certificates: 1. Of having been engaged during a period of not less than two years in acquiring a practical familiarity with the details of mechanical dentistry, under the instruction (which may be taken prior to registration as a dental student) of a competent practitioner or under the direction of the superintendent of the mechanical department of a recognised dental hospital. 2. Of registration as a dental student by the *General Medical Council.* 3. Of having attended at a recognised Dental Hospital and School (*a*) a course of lectures on Dental Metallurgy; (*b*) a course of Practical Dental Metallurgy; (*c*) a course of Lectures on Dental Mechanics; and (*d*) a course of Practical Dental Mechanics, including the manufacture and adjustment of six dentures and six crowns. Candidates may present themselves for the *First Professional Examination* on production of the required certificates. The Examination consists of Mechanical Dentistry and Dental Metallurgy, the examination in Dental Metallurgy being by written paper. III. The Second Professional Examination.—The candidate must produce the following certificates: 1. Of having been engaged during four years in the acquirement of *professional* knowledge subsequently to the date of registration as a dental student. 2. Of having attended at a recognised dental hospital and school (*a*) a course of Dental Anatomy and Physiology; (*b*) a separate course of Dental Histology, including the preparation of microscopical sections; (*c*) a course of Dental Surgery; (*d*) a separate course of Practical Dental Surgery; (*e*) a course of not less than five lectures on the Surgery of the Mouth, which lectures may be given at a dental hospital or at a recognised medical school; in the latter case they may form part of the course of lectures on Surgery; (*f*) a course of Dental Materia Medica; and (*g*) a course of Dental Bacteriology. 3. Of having attended at a recognised dental hospital or in the dental department of a recognised general hospital the practice of Dental Surgery *during two years.* 4. Of having attended at a recognised medical school (*a*) a course of lectures on Anatomy, (*b*) a course of lectures on Physiology, (*c*) a separate Practical Course of Physiology, (*d*) a course of lectures on Surgery, and (*e*) a course of lectures on Medicine. The lectures on Surgery and Medicine must be attended after the completion of the courses of lectures on Anatomy and Physiology. 5. Of having performed Dissections at a recognised medical school during not less than appeared as a result of this vaccination were collected and a portion of the resulting emulsion was inoculated on a second bovine. This animal also developed typical vaccine vesicles at the site of inoculation.

It seems evident that the pathological condition which affected the men's hands and the cows' udders was vaccinia. Endeavours have been made to ascertain how the condition first appeared in the cows but so far without success. No persons attending the cows had been vaccinated recently nor had any member of their families. The only other disease noticed among the farm animals was a few cases of foot-rot in sheep; and, from the experiments which I have made, foot-rot material inoculated on guinea-pigs, calves, and goats, not only sets up no pathological condition resembling vaccinia, but affords no protection against subsequent inoculations with calf vaccine.

The farmer states that his cows have on previous occasions suffered from sore teats, but according to his observations in not the same manner as on the present occasion. There is a possibility, therefore, that the vaccinia may have been endemic on the farm for some time. But the fact that no cow-men have contracted vaccinia previously contradicts such a supposition.

I am greatly indebted to Dr. Wilson, under whose care were all the patients, for his kindness in affording me readily every facility for investigation in his power and for much valuable help; and to my colleague, Dr. A. T. MacConkey, who during my brief absence from work was notified of the outbreak, for generously handing over the matter to my department on my return to Elstree.

ON A LOCALISED OUTBREAK OF SCARLET FEVER PRESUMABLY ATTRIBUTABLE TO INFECTED MILK.

By Sir CHARLES A. CAMERON, C.B., M.D. R.U.I.,
MEDICAL OFFICER OF HEALTH OF DUBLIN.

THE city of Dublin is intersected by a river, and the population of the northern side is slightly over 142,000. The population of the southern side is about 160,000. From July 1st to August 12th, 1908, 28 cases of scarlet fever occurred in the northern division and nine cases in the southern division of the city. On the south side the cases were widely separated. On the north side ten cases of scarlet fever were notified up to July 24th; they were pretty widely distributed. From July 27th to August 8th 16 cases were notified, all occurring within a radius of less than three-quarters of a mile. Of the patients two were adults and 14 were children. In each of two houses there were three cases of the disease; in the remaining ten houses there was one case in each house. In the district there were many dairies, but every one of the patients had used the milk of only one dairy, the owner of which resided in the centre of the affected area. The dairyman's establishment consisted of himself, his wife, nine children, and two workmen. His wife had a sore throat but not a severe one. One of the workmen had severe tonsillitis and was feverish. I found him in bed and had him removed to hospital, where he was kept under observation. No desquamation of cuticle took place. When I saw him there was no rash out and he said that he was ill only two days. The other workman had a slight sore throat. The cows of this dairyman were on pastures situated about three miles from the city. The men, together with the workmen of four other dairymen, slept in two houses near the pastures. Inquiry failed to discover that any of these men had recently been suffering from scarlet fever. These houses were occasionally slept in by other persons than the employees of the dairymen who were there when the outbreak of scarlet fever occurred. The cows were examined and found to be free from disease. A physician called in by the proprietor of the suspected dairy examined the whole family and certified that they were not suffering from any infectious disease. In these circumstances I could not prevent the sale of milk from the dairy. The houses in which the workmen had slept were, however, thoroughly disinfected, as were also the dairy and its churns and other utensils, as well as the dwelling house. To these operations the owner at once agreed.

The 16 cases of scarlet fever occurred in 12 houses. Although they were in the same district, yet the infected houses were not very close together, and there was no reason to suspect that the later cases were the result of antecedent ones by direct contagion. In attributing this localised outbreak of scarlet fever to the use of infected milk it would be more satisfactory if it could be shown that amongst the persons connected with the dairy one of them had suffered from scarlet fever. Still, it is in the highest degree improbable that 16 cases of scarlet fever should occur amongst persons using the milk from the dairy in question if the milk were free from pathogenetic micro-organisms. As large quantities of milk were sent out from this dairy it may be thought why were there not more than 16 cases of disease amongst the large number of persons supplied. It does not, however, follow that the whole of the milk was infected, and even if some persons drank the infected milk it does not follow that they must inevitably have contracted the disease. Some of them may already have had an attack of scarlet fever, others might not have been in that state of receptivity which is necessary before infection can develop into disease. On August 10th two children in one of the two houses in which, on August 4th, three cases of scarlet fever occurred were notified to have the disease. It seems more likely that these children were infected by the children who were infected by the milk. On August 24th it was notified that a second case had occurred in a house in which on July 27th a child was ill with the disease who had drunk the milk which I believe was infected. This last case was no doubt the result of the antecedent one in the same house, for in this instance and in nearly all the others the patients were not brought to hospital and being in good circumstances were attended to in their homes.

Dublin.

A CASE OF ECTOPIC GESTATION ON THE GOLDFIELDS.

By R. STANLEY TAYLOR, M.R.C.S. Eng., L.R.C.P. Lond.,
B.A., M.B., B.C. Cantab.,
MEDICAL OFFICER TO THE NANNINE HOSPITAL; MEDICAL OFFICER OF HEALTH OF NANNINE, WESTERN AUSTRALIA.

I WAS called 14 miles to a patient, a married woman, 39 years of age, who was said to be dying, and arrived at 1.30 P.M. on May 5th, 1908, when I found the patient slightly cyanosed and pale and complaining of pain in the abdomen and inability to move. On examination per abdomen I found, in a fat woman, pain in the left iliac fossa accompanied by tenderness but without rigidity. No tumour was anywhere palpable. Per vaginam a soft tender swelling filled the posterior and both lateral fornices. The pulse (94) was small but very strong and regular. The temperature was 99° F. On inquiring into the history of the present condition I was informed that during the previous night (May 4th) the patient, who had been quite well all day, awoke with severe pain in the left iliac fossa. She felt sick and faint but neither vomited nor fainted and the pain gradually became easier, though it was still too severe the next morning to allow her to move. The menstrual history showed that the catamenia began at the age of 17 years; they were regular, lasting four days, and recurring every 28 days. The patient was married at 19 years and had her first child before she was 20. She had had altogether 11 children. Two (Nos. 4 and 6) were stillborn and three died aged respectively 12 months, 14 months, and 2½ years, the cause of death being "teething," "diphtheria," and "teething" respectively. The youngest child was 18 months old. The patient had had three miscarriages, the last being three years ago. She last menstruated a fortnight previously (April 20th) and noticed that the amount was excessive. I diagnosed ruptured ectopic gestation and the treatment consisted of absolute rest in bed and opiates.

On May 14th I was called out at 12.10 A.M. and owing to bad roads and a tired horse arrived at 3 A.M. The patient then said that she had been steadily recovering till the evening of the 11th, when she had had another attack similar to the first but had recovered from it. On the evening of the 13th she had had a third attack and when I

General Education), Primary Dental, and Final Dental. Preliminary Examination.—All examinations in general education recognised by the General Medical Council are accepted by the College. Preliminary Examinations are held conjointly by the Royal Colleges of Physicians and Surgeons on the third Wednesdays in March and September. Primary Dental Examination.—Fee £10 10*s.*; for re-examination, if rejected, £5 5*s.* Every candidate[1] is required, before admission to the Primary Dental Examination, to produce evidence—(1) of having passed a recognised preliminary examination and of having been registered as a medical or dental student by the General Medical Council; (2) of having, subsequently to registration as a dental or medical student, attended at a recognised medical school the following courses: Lectures on Practical Anatomy, including Dental Anatomy, six months; Demonstrations and Dissections, two courses of six months each; Lectures on Chemistry, six months; Lectures on Physiology, including Dental Physiology, six months; Practical Histology and Practical Chemistry, including Metallurgy, three months; (3) of having attended Clinical Instruction at a recognised general hospital for one year. The subjects of this examination are: (1) Physics;[2] (2) Chemistry, including Metallurgy; (3) Anatomy; (4) Physiology and Histology; and (5) Surgery. Final Examination.—Candidates holding L.R.C.S.I. or students who have passed Primary Dental or Third Professional Examination of the College, £10 10*s.*; re-examination, £5 5*s.* Fees for Final Examination of all other candidates, £26 5*s.*; re-examination, £10 10*s.* Extra fee for Special Examination, £5 5*s.* Candidates must produce evidence of having passed the Primary Dental Examination of this College, or the Third Professional Examination under the Conjoint Board with the Royal College of Physicians in Ireland, or with the Apothecaries' Hall, or an equivalent examination recognised by the College, and are required to produce certificates of having attended: (1) the following courses of lectures recognised by the College: Dental Surgery and Pathology (two courses), Dental Mechanics (two courses); (2) for two years the practice of a dental hospital recognised by the College or of the dental department of a general hospital so recognised; (3) of having been engaged during four years in professional studies; and (4) of having received three years' instruction in Mechanical Dentistry from a registered dentist. Candidates holding a diploma in Surgery shall be admissible to the Final Dental Examination on producing certificates of having attended: (1) one course of Lectures on Dental Surgery and Pathology; (2) one course of Lectures on Dental Mechanics; (3) for one year the practice of a dental hospital recognised by the College, or of the dental department of a general hospital so recognised, where such attendance has been subsequent to the date of diploma (this remission (3) has been made on the understanding that the surgeon devotes his whole time to dental work); and (4) of having been engaged during a period of not less than two years in acquiring a practical familiarity with the details of Mechanical Dentistry under the instruction of a registered dentist. The following are the subjects of examination: Dental Surgery, Theoretical (including Dental Pathology), Clinical, and Operative; Dental Mechanics, Theoretical, Clinical, and Practical (including the Metallurgy of the Workshop). Examinations for the Licence in Dentistry *sine curriculo*: The Council has power to admit to examination, *sine curriculo*, candidates whose names are on the Dental Register published under the direction of the General Medical Council, and who are unable to furnish the certificates required by the foregoing regulations, on presentation of a special schedule of application.

University of Birmingham.—The teaching of Dentistry is undertaken by the University acting in association with the Birmingham Dental Hospital and the Birmingham Clinical Board, so that the students may fully qualify themselves for the Dental diploma of this and other universities and licensing bodies. There is a special and well-equipped Dental Museum and Laboratory. An Entrance Exhibition, value £37 10*s.*, is awarded annually at the commencement of the winter session. The following are the *regulations for* Degrees in Dentistry:—1. The degrees conferred by the University are those of Bachelor and Master of Dental Surgery (B.D.S. and M.D.S.). 2. All candidates for these degrees must pass the same Matriculation Examination as that required from candidates for Medical Degrees. 3. The degree of Bachelor of Dental Surgery is not conferred upon any candidate who has not obtained a Licence in Dental Surgery. The candidate is not eligible for the degree until a period of 12 months has elapsed from the passing of his examination for the Licence in Dental Surgery. Of this period at least six months must be spent in the dental department of a general hospital approved by the University. 4. *A.* In addition to the Licence in Dental Surgery the candidate must produce evidence that he has attended the courses required by medical students of the University in the following subjects and passed the Examinations held in the same for Medical and Surgical Degrees: (*a*) Chemistry and Practical Chemistry, (*b*) Physics and Practical Physics, (*c*) Elementary Biology, (*d*) Anatomy and Practical Anatomy, and (*e*) Physiology and Practical Physiology. *B.* That he has attended the following courses and passed the class examinations in each of these subjects: (*f*) One Special Course of Lectures on Medicine, (*g*) One Special Course of Lectures on Surgery, and (*h*) Pathology and Bacteriology. *C.* That he has attended courses and passed the class examinations in: (*k*) Dental Histology and Patho-Histology, (*l*) Comparative Dental Anatomy, and (*m*) Dental Surgery and Prosthetic Dentistry. *D.* That he has received instruction in the Clinical Examination of living cases at the dental department of a general hospital for a period of not less than six months. 5. The Final Examination will deal with the subjects in Classes *C* and *D.* 6. On the expiration of 12 months from the date of passing the Examination for the Degree of Bachelor of Dental Surgery, the candidate will be eligible for that of Master of Dental Surgery. 7. For this degree candidates will be required to submit a thesis containing original work and investigations in some subject connected with Dentistry, which thesis shall be submitted to examiners to be nominated by the Dental Advisory Board. The degree will be awarded or withheld according to the report of these examiners.

The University also grants a diploma in Dental Surgery (L.D.S.) to candidates who have followed the *prescribed* regulations for the same.

University of Leeds.—The degrees in Dental Surgery are Bachelor of Dental Surgery (B.Ch.D.) and Master of Dental Surgery (M.Ch.D.). All candidates for the degree of Bachelor of Dental Surgery shall be required to have passed the Matriculation examination, to have pursued thereafter approved courses of study for not less than five academic years, two of such years at least having been passed in the University subsequently to the date of passing Parts I. and II. of the first examination, and to have completed such period of pupilage or hospital attendance, or both, as may be prescribed by the regulations of the University. No candidate will be admitted to the degree who has not attained the age of 21 years on the day of graduation. All candidates are required to have passed the following examinations: the first examination, the second examination, and the final examination. Each examination will include practical work in the subjects offered. All candidates shall be required, before presenting themselves for examination, to furnish to the registrar certificates testifying that they have attended the prescribed courses of instruction in accordance with the regulations of the University in each of the subjects which they offer, and that they have fulfilled the other requirements of the ordinance and regulations in respect of such examination. Candidates for the diploma in Dental Surgery (L.D.S.) are required to present certificates showing that they have attained the age of 21 years, that they have attended courses of instruction approved by the University, extending over not less than four years, and that they have completed a pupilage of three years, two of such years at least having been taken before the First Professional examination. Candidates are required to satisfy the examiners in the several subjects of the following examinations: A preliminary examination in Arts; a preliminary examination in *Science*; the First Professional examination; and the Final examination. The classes in the Department of Dentistry will begin on Oct. 1st. The instruction in the Preliminary subjects of Chemistry, Physics, and Biology will be given at the University in College-road. The classes in the other subjects way the reader is able to learn the legal provisions of a subject while its other aspects are fresh in his mind. But as legislation was busy during 1907 it became necessary to introduce a separate chapter under the heading of "Recent Sanitary Legislation."

---

[1] Candidates educated in England or Scotland are admitted to the Primary Dental Examination on the production of the certificates that would be necessary for both Primary and Final Examinations in their own countries.

[2] Candidates who have passed in Chemistry and Physics at a First Professional Examination under the Conjoint Board with the Royal College of Physicians in Ireland, or with the Apothecaries' Hall, or an equivalent examination recognised by the College, are exempted from examination in these subjects at the Primary Dental Examination.

The book as a whole is a thoroughly comprehensive one and its scope is naturally wider than is the case of the smaller text-books. In the chapter on water analysis we are glad to see the author placing in the forefront the importance of "a careful local inspection" of the source. We wish that all analysts would take this view, as we might then hear of fewer instances of water passed by the analyst causing outbreaks of disease. The chapter on air is thoroughly up-to-date, and the author discusses the influence of temperature and moisture in producing the ill-effects experienced in overcrowded atmospheres. Considerations as to food are dealt with in exemplary fashion, but in the section dealing with the law relating to the milk trade we do not find reference to the important powers obtainable either under the Infectious Disease (Prevention) Act, 1890, or under what are known as the Liverpool or Manchester Milk Clauses. We do not quite agree with some of the author's comments as to the difficulty in obtaining regulations under the Dairies, Cowsheds, and Milkshops Order, and it is not, we think, at all common to employ police officers for the inspection of dairies. One of the most valuable chapters in the work is that devoted to parasites. The section devoted to the protozoa is most helpful and the numerous plates are excellent. Some of Lieutenant-Colonel Firth's views as regards tuberculosis will invite the criticism of those who claim for the disease a high infectivity. The author's opinion is set forth as follows: "We ourselves are disposed to think that bovines are the main source of tuberculosis in man, and that the theory of infection by inhalation rests upon imperfect knowledge; we are convinced that this method of contracting the disease is rare." In the matter of statistics this volume is in advance of any other book on public health as considerable space is devoted to the methods used by Professor Karl Pearson in his biometrical studies.

The chapters on military and naval hygiene will be very welcome to all service men, but we have been wondering as we read these pages whether it might not be possible to have two separate issues of this admirable volume—the one for service men, the other for non-service; this latter volume omitting the military and naval hygiene and substituting therefor a fuller discussion of sanitary law. But the book is certainly one which ought to be possessed by all who are interested in public health.

Manual of Medical Jurisprudence, Toxicology, and Public Health. By W. G. AITCHISON ROBERTSON, M.D., D.Sc. Edin., F.R.C.P. Edin., F.R.S. Edin., Lecturer on Medical Jurisprudence and Public Health, School of Medicine, Royal College of Surgeons, Edinburgh. With 39 illustrations. London: Simpkin, Marshall, and Co., Limited. 1908. Pp. 560. Price 8s. net.

DR. Robertson has succeeded in compressing into a moderate compass a large amount of information on the subjects of medical jurisprudence, toxicology, and public health. The various facts are clearly stated, and the conclusions to be deduced from them are ably expressed.

In the first chapter criminal procedure is described, especial attention being directed to legal procedure in criminal cases in Scotland which differs somewhat from that which is followed in England and Ireland. The rules of evidence are briefly considered, and some useful rules to be observed in giving evidence are supplied. The effect of skilled evidence much depends upon the way in which it is delivered. Accuracy and non-indulgence in highly scientific phraseology are essential. Nothing makes so bad an impression on judge and jury as a medical witness who forgets important details, such as dates, names, sequence of symptoms, and so on; whilst the too free use of scientific terms may easily confuse the court. We well remember the temporary embarrassment of a medical witness when asked by the judge to explain to the jury the meaning of the word "neurotic."

The chapters dealing with the performance of medico-legal post-mortem examinations and the causes and signs of death are well written and give a clear account of the subject. We cannot altogether agree, however, with some of Dr. Robertson's remarks on suspended animation and apparent death. We think that, unintentionally no doubt, he exaggerates the possibility of the latter. We do not consider that he gives sufficient proof of his statement: "Authentic cases of supposed dead persons rising from the coffin are numerous." If such cases were submitted to careful scientific analysis we believe that probably the large majority of them would be proved to have been erroneously reported. Brouardel's remarks on this subject are reassuring: "A person dies; he is carried to an apartment called the 'mortuary chamber' ...... and a bell-rope is placed in his hand. ...... Gentlemen, from the time that mortuary chambers were instituted—and that at Weimar dates from 1792—neither at Weimar nor at Munich ...... nor anywhere else, I believe, has anybody ever rung that bell."

The subject of the medico-legal aspect of wounds is considered in an interesting manner, gunshot injuries being especially well described. The portion of the book dealing with toxicology contains a consideration of all the important poisons, and the symptoms, post-mortem appearances, tests, and treatment are accurately given.

The third section—namely, the one on public health—contains a large amount of information on ventilation, heating, water-supply, house sanitation, sewage, and also remarks on infectious diseases, vital statistics, meat inspection, and, finally, some observations on sanitary administration and sanitary law.

This manual contains all that is necessary for the student to know in regard to the above subjects for the ordinary pass examinations in the final subjects. For the higher examinations a larger work would be necessary. Dr. Robertson has an easy style of writing which will attract the student's attention and will render the study of medical jurisprudence and public health a pleasing one.

Les Ferments Métalliques et leur emploi en Thérapeutique: (Metallic Ferments and their Use in Treatment.) Par ALBERT ROBIN, Professeur de Clinique Thérapeutique à la Faculté, Membre de l'Academie de Médecine. Paris: J. Rueff. 1907. Pp. 252. Price fr. 4.

IN 1901 Professor Robin published some observations concerning the therapeutic action of certain metals in a state of very fine division, an action which he states is remarkably like that of the organic ferments. This fact has led him to refer to the substances which he has employed as metallic ferments. He uses chiefly the following metals: gold, platinum, silver, and palladium in a "colloidal state." These preparations are easy to obtain but difficult to preserve. The method of preparation is simply to allow a series of electric sparks to pass between two electrodes of the metal which it is desired to use through a small quantity of pure sterilised water in a porcelain capsule. A current of three or four ampères with a voltage of 110 is said to give the best results. At each spark a small cloud appears which rapidly disappears in the liquid. Gold gives a violet-coloured solution, silver a brown, General Education), Primary Dental, and Final Dental. Preliminary Examination.—All examinations in general education recognised by the General Medical Council are accepted by the College. Preliminary Examinations are held conjointly by the Royal Colleges of Physicians and Surgeons on the third Wednesdays in March and September. Primary Dental Examination.—Fee £10 10*s.*; for re-examination, if rejected, £5 5*s.* Every candidate[1] is required, before admission to the Primary Dental Examination, to produce evidence—(1) of having passed a recognised preliminary examination and of having been registered as a medical or dental student by the General Medical Council; (2) of having, subsequently to registration as a dental or medical student, attended at a recognised medical school the following courses: Lectures on Practical Anatomy, including Dental Anatomy, six months; Demonstrations and Dissections, two courses of six months each; Lectures on Chemistry, six months; Lectures on Physiology, including Dental Physiology, six months; Practical Histology and Practical Chemistry, including Metallurgy, three months; (3) of having attended Clinical Instruction at a recognised general hospital for one year. The subjects of this examination are: (1) Physics;[2] (2) Chemistry, including Metallurgy; (3) Anatomy; (4) Physiology and Histology; and (5) Surgery. Final Examination.—Candidates holding L.R.C.S.I. or students who have passed Primary Dental or Third Professional Examination of the College, £10 10*s.*; re-examination, £5 5*s.* Fees for Final Examination of all other candidates, £26 5*s.*; re-examination, £10 10*s.* Extra fee for Special Examination, £5 5*s.* Candidates must produce evidence of having passed the Primary Dental Examination of this College, or the Third Professional Examination under the Conjoint Board with the Royal College of Physicians in Ireland, or with the Apothecaries' Hall, or an equivalent examination recognised by the College, and are required to produce certificates of having attended: (1) the following courses of lectures recognised by the College: Dental Surgery and Pathology (two courses), Dental Mechanics (two courses); (2) for two years the practice of a dental hospital recognised by the College or of the dental department of a general hospital so recognised; (3) of having been engaged during four years in professional studies; and (4) of having received three years' instruction in Mechanical Dentistry from a registered dentist. Candidates holding a diploma in Surgery shall be admissible to the Final Dental Examination on producing certificates of having attended: (1) one course of Lectures on Dental Surgery and Pathology; (2) one course of Lectures on Dental Mechanics; (3) for one year the practice of a dental hospital recognised by the College, or of the dental department of a general hospital so recognised, where such attendance has been subsequent to the date of diploma (this remission (3) has been made on the understanding that the surgeon devotes his whole time to dental work); and (4) of having been engaged during a period of not less than two years in acquiring a practical familiarity with the details of Mechanical Dentistry under the instruction of a registered dentist. The following are the subjects of examination: Dental Surgery, Theoretical (including Dental Pathology), Clinical, and Operative; Dental Mechanics, Theoretical, Clinical, and Practical (including the Metallurgy of the Workshop). Examinations for the Licence in Dentistry *sine curriculo*: The Council has power to admit to examination, *sine curriculo*, candidates whose names are on the Dental Register published under the direction of the General Medical Council, and who are unable to furnish the certificates required by the foregoing regulations, on presentation of a special schedule of application.

University of Birmingham.—The teaching of Dentistry is undertaken by the University acting in association with the Birmingham Dental Hospital and the Birmingham Clinical Board, so that the students may fully qualify themselves for the Dental diploma of this and other universities and licensing bodies. There is a special and well-equipped Dental Museum and Laboratory. An Entrance Exhibition, value £37 10*s.*, is awarded annually at the commencement of the winter session. The following are the regulations for Degrees in Dentistry:—1. The degrees conferred by the University are those of Bachelor and Master of Dental Surgery (B.D.S. and M.D.S.). 2. All candidates for these degrees must pass the same Matriculation Examination as that required from candidates for Medical Degrees. 3. The degree of Bachelor of Dental Surgery is not conferred upon any candidate who has not obtained a Licence in Dental Surgery. The candidate is not eligible for the degree until a period of 12 months has elapsed from the passing of his examination for the Licence in Dental Surgery. Of this period at least six months must be spent in the dental department of a general hospital approved by the University. 4. *A.* In addition to the Licence in Dental Surgery the candidate must produce evidence that he has attended the courses required by medical students of the University in the following subjects and passed the Examinations held in the same for Medical and Surgical Degrees: (*a*) Chemistry and Practical Chemistry, (*b*) Physics and Practical Physics, (*c*) Elementary Biology, (*d*) Anatomy and Practical Anatomy, and (*e*) Physiology and Practical Physiology. *B.* That he has attended the following courses and passed the class examinations in each of these subjects: (*f*) One Special Course of Lectures on Medicine, (*g*) One Special Course of Lectures on Surgery, and (*h*) Pathology and Bacteriology. *C.* That he has attended courses and passed the class examinations in: (*k*) Dental Histology and Patho-Histology, (*l*) Comparative Dental Anatomy, and (*m*) Dental Surgery and Prosthetic Dentistry. *D.* That he has received instruction in the Clinical Examination of living cases at the dental department of a general hospital for a period of not less than six months. 5. The Final Examination will deal with the subjects in Classes *C* and *D.* 6. On the expiration of 12 months from the date of passing the Examination for the Degree of Bachelor of Dental Surgery, the candidate will be eligible for that of Master of Dental Surgery. 7. For this degree candidates will be required to submit a thesis containing original work and investigations in some subject connected with Dentistry, which thesis shall be submitted to examiners to be nominated by the Dental Advisory Board. The degree will be awarded or withheld according to the report of these examiners.

The University also grants a diploma in Dental Surgery (L.D.S.) to candidates who have followed the prescribed regulations for the same.

University of Leeds.—The degrees in Dental Surgery are Bachelor of Dental Surgery (B.Ch.D.) and Master of Dental Surgery (M.Ch.D.). All candidates for the degree of Bachelor of Dental Surgery shall be required to have passed the Matriculation examination, to have pursued thereafter approved courses of study for not less than five academic years, two of such years at least having been passed in the University subsequently to the date of passing Parts I. and II. of the first examination, and to have completed such period of pupilage or hospital attendance, or both, as may be prescribed by the regulations of the University. No candidate will be admitted to the degree who has not attained the age of 21 years on the day of graduation. All candidates are required to have passed the following examinations: the first examination, the second examination, and the final examination. Each examination will include practical work in the subjects offered. All candidates shall be required, before presenting themselves for examination, to furnish to the registrar certificates testifying that they have attended the prescribed courses of instruction in accordance with the regulations of the University in each of the subjects which they offer, and that they have fulfilled the other requirements of the ordinance and regulations in respect of such examination. Candidates for the diploma in Dental Surgery (L.D.S.) are required to present certificates showing that they have attained the age of 21 years, that they have attended courses of instruction approved by the University, extending over not less than four years, and that they have completed a pupilage of three years, two of such years at least having been taken before the First Professional examination. Candidates are required to satisfy the examiners in the several subjects of the following examinations: A preliminary examination in Arts; a preliminary examination in Science; the First Professional examination; and the Final examination. The classes in the Department of Dentistry will begin on Oct. 1st. The instruction in the Preliminary subjects of Chemistry, Physics, and Biology will be given at the University in College-road. The classes in the other subjects muscle is shown by graphic records. 2. Studies of the Relationship between Respiration and Blood Pressure. Part I.: The Effect of Changes of Intrapericardial Pressure on Aortic Pressure, by Thomas Lewis, from the Physiological Laboratory, University College, London. The author in this part shows that the heart is peculiarly susceptible of the changes of pressure external to it. In small cats the rise of blood pressure accompanying suspended or prolonged inspiration is entirely due to the change of intrapericardial pressure. In larger cats this has not been so clearly ascertained. Nevertheless, it is certain that increased diastolic filling of the heart plays a large part in causing the inspiratory rise of blood pressure in these animals. Part II.: Facts bearing on the Relationship of Different Factors in the Production of Respiratory Curves of Blood Pressure. In this part the author shows that in man a deep intercostal inspiration which is not prolonged yields a pure fall of blood pressure. A deep diaphragmatic inspiration which is not prolonged gives a pure rise of blood pressure. In expiration the reverse effects hold. 3. Note on the Supposed Existence of Vaso-constrictor Fibres in the Chorda Tympani Nerve, by W. M. Bayliss, from the Physiological Laboratory, University College, London. Mr. Bayliss, to test the statements of M. Fröhlich and M. Loewi, which seemed to demonstrate the presence of vaso-constrictor nerve fibres in the chorda tympani and therefore to invalidate the experimental results of many previous investigators, placed cats under the influence of amyl nitrite and sodium nitrite, and states that he has been unable to obtain any results which would warrant the interpretation of their being due to the pressure of vaso-constrictor fibres. Tracings are given of the action not only of animals under the influence of the above-mentioned drugs but also of pilocarpine and atropine. Mr. Bayliss appends to this article a note on the excitation of vaso-dilator nerve fibres in depressor reflexes. Various experiments are described and tracings shown, the results of which demonstrate, he believes, that in addition to the generally assumed action of the depressor nerve—viz., that it produces fall of blood pressure by inhibition of tone of the vaso-constrictor centre—there is also an excitation of the vaso-dilator nerves. 4. A Criticism of the Nitro-molybdate Method for the Detection of Phosphorus in Tissues, by G. G. Nasmith, Ph.D., and E. Fidlar, B.A., M.B. The authors agree with Bensley that the reduction of compounds of molybdenum is the cause of the blue-green colour which appears in the sections and that it is not due to the presence of phosphorus at all. This number also contains the Proceedings of the Physiological Society for June 20th and July 18th, 1908.

---

[1] Candidates educated in England or Scotland are admitted to the Primary Dental Examination on the production of the certificates that would be necessary for both Primary and Final Examinations in their own countries.

[2] Candidates who have passed in Chemistry and Physics at a First Professional Examination under the Conjoint Board with the Royal College of Physicians in Ireland, or with the Apothecaries' Hall, or an equivalent examination recognised by the College, are exempted from examination in these subjects at the Primary Dental Examination.

The Biochemical Journal. Edited by BENJAMIN MOORE, M.A., D.Sc., and EDWARD WHITLEY, M.A. Vol. III., Nos. 6, 7, and 8. August 10th, 1908. Published by the Biochemical Department, University of Liverpool. Annual subscription, 15*s.* per volume of 480 pages.—The contents of this part are: 1. The Effects of Variations in the Inorganic Salts and the Re-activity of the External Medium upon the Nutrition, Growth, and Cell-division in Plants and Animals, by Benjamin Moore, M.A., D.Sc.; Herbert E. Roaf, M.D. Tor.; and Robert E. Knowles, M.D. Liverp. The authors find that in plants a very moderate degree of acidity represses growth and stops cell-division, whilst short of the lethal dose there is marked stimulation by alkali. The kation present appears to have a specific effect and potassium is much more stimulating than sodium to both rootlets and foliage. The phosphatic anion has a special effect upon the flower causing increase in size, irregular inflorescence and packed florets. The cytological effects are shown in numerous illustrations of hyacinth rootlets. With acid solutions there are absence or depression of nuclear division and thickening of the cell walls; with the alkalies, increase in nuclear division, changes in chromosomes, and irregular figures are visible and the cell outlines become obscured. The effects of the two agents in animals are also described. 2. An Investigation of the Toxic Actions of Dilute Solutions of the Salts of Certain Heavy Metals as Copper, Iron, Nickel, Cobalt, Manganese, Zinc, Silver, and Lead, upon the Bacillus Typhosus with a view to practical application in the purification of shell-fish, by Benjamin Moore, M.A., D.Sc., and James Leonard Hawkes, M.D. Liverp. 3. Note on the Chemical Composition and Physical Properties of Renal Calculi, by J. Sydney Rowlands, M.D. Liverp., Thelwall Thomas Fellow in surgical pathology. 4. On the Presence of an Oxidising Enzyme in the Latex of Hevea Brasiliensis, by D. Spence, Ph.D., A.I.C. 5. Experimental Evidence of the Local Production of "Opsonins," by H. Leith Murray, M.D. Aberd., R. Stenhouse Williams, M.B. Edin., D.P.H. Camb., and J. Orr, L.R.C.P. & S. Edin., D.P.H. 6. Experimental Inoculation of Meningococci Vaccine, by R. Stenhouse Williams, M.B. Edin., D.P.H Camb., H. Leith Murray, M.D. Aberd., and J. Orr, L.R.C.P & S. Edin. 7. Changes in the Chemical Composition of the Herring during the Reproductive Period, by T. H. Milroy professor of physiology, Queen's College, Belfast.

The Edinburgh Medical Journal.—In the August issue of this magazine, the second number of the new series, Sir G. T Beatson records two cases of Intussusception in Infants in which the appendix vermiformis was included in the tumour In one case the appendix needed removal as the result of the strangulation from which it had suffered. In an interesting paper on Vaccine Treatment in Surgery Mr. H. M. W Gray reiterates his belief that opsonic determinations are not indispensable for the due administration of tuberculin T.R He reports that in some 200 cases in which this remedy was used he noted six in which distinct harm resulted and a number in which no effect either way was noticeable; in the great majority good ensued. He recommends the use of tuberculin in early cases, such as enlarged glands of doubtful nature, as a precautionary measure. Dr. H. G. Langwill gives notes of two cases of Fainting Fits, apparently due to accumulation of blood in the splanchnic system, the patients being cured by the application of an abdominal binder; and Dr. John Eason writes on Mechanical and Orthostatic Purpura and expresses the belief that many cases of this disorder are due to rupture of capillaries by simple pressure and are not toxic in nature.

The Dublin Journal of Medical Science.—In the August number appears the first part of Mr. E. Hastings Tweedy's annual report of the Rotunda Hospital. Dr. Walter G. Smith writes on Oxaluria and Phosphaturia. He shows that the oxalic acid excreted is partly exogenous and partly endogenous in origin and concludes that the appearance of this substance in the urine is of surgical interest as a component of calculi rather than of medical importance as a sign of metabolic irregularity, while the phosphoric acid of the urine is almost entirely exogenous and is only of clinical importance in the form of juvenile phosphaturia. Dr. Reginald Holmes commends Calmette's ophthalmic reaction as a valuable test for tuberculosis and Dr. A. F. G. Kerr gives a short epitome of our knowledge of protozoal diseases in man.

The Medical Chronicle.—The original matter contained in the August number of this magazine consists in a first instalment of some lectures on the Pathology of Cancer by Mr. Charles Powell White. He classifies tumours as organ tumours, or organomata, tissue tumours, or histiomata, and cell tumours, or cytomata. This classification leads to a distinction being drawn between the epitheliomata and the carcinomata, the former term being applied to various kinds two yearly instalments. The curriculum requires two years to be passed at a General Hospital; the fee for this is about £60. Both hospitals can be attended simultaneously. The fee for the instruction in Mechanical Dentistry and the two years' hospital practice required by the curriculum is £150 if paid in one instalment, or 150 guineas if paid in three equal instalments. The fee for tuition in Mechanical Dentistry is 50 guineas per annum; for one year's hospital practice £21. The Dean attends at the hospital every Wednesday morning from 9 to 10.30, or he can be seen at other times by appointment. Letters to be addressed—The Dean, 32, *Leicester-square*, "to be forwarded."

National Dental Hospital and College.—Corner of Great Portland and Devonshire-streets, W.—Consulting Surgeon: Sir Victor Horsley. Consulting Dental Surgeon: Mr. Sidney Spokes. Visiting Physician: Dr. James Maughan. Visiting Surgeon: Mr. E. W. Roughton. Dental Surgeons: Mr. F. H. Weiss, Mr. K. W. Goadby, Mr. W. Weiss, Mr. Rushton, Mr. H. R. Pring, and Mr. A. E. Relph. Assistant Dental Surgeons: Mr. H. Creemer Cooper, Mr. H. W. Turner, Mr. Sydney Corbett, and Dr. J. W. Pare. Anæsthetists: Mr. H. P. Noble, Mr. C. J. Ogle, Mr. Vivian B. Orr, Dr. J. Maughan, Dr. Cecil Hughes, and Mr. R. E. Delbruck. Lecturers (winter), Dental Anatomy and Physiology: Dr. J. W. Pare, Tuesdays and Thursdays, 5 P.M., in October, November, and December. Dental Metallurgy: Mr. Hugh Candy, Tuesdays, 5 P.M., in January, February, and March. Dental Mechanics: Mr. H. W. Turner, Wednesdays, 5.30 P.M., in May, June, and July. Dental Materia Medica: Mr. Charles W. Glassington, Tuesdays, 6 P.M., October, November, and December. Summer—Dental Surgery and Pathology, Mr. H. J. Relph, Thursdays, 5 P.M., during January, February, and March. Bacteriology of the Mouth: Mr. K. W. Goadby, Tuesdays, 4 P.M., during May, June, and July. Practical courses to comply with the R.C.S. curriculum are also held. The hospital is lighted throughout by electricity and warmed and ventilated by approved methods. Clinical Lectures and Demonstrations are given from time to time, and each student on entering passes *through a preliminary* course under a demonstrator. The stopping rooms have accommodation for 50 chairs. Dresserships in the *extraction and stopping* rooms are re-arranged every three months. Two Entrance Exhibitions, of the value of £40 and £20, are open for competition. Prizes are open for competition at the end of each course of lectures. *Certificates of honour* are also open in each class. The Rymer Medal for General Proficiency, value £5, is awarded annually to the most meritorious student; and the Ash Prize, value £3 3*s.*, for a Thesis on a subject in Dental Surgery. Total fee for the Special Lectures and Hospital Practice required, 40 guineas. A composition fee covering the two years' mechanical pupilage and the two years' hospital *practice required* by the Royal College of Surgeons, £120. Single Courses: Dental Anatomy and Physiology, Dental Surgery and Pathology, Dental Mechanics, Dental Metallurgy, Bacteriology of the Mouth, Dental Materia Medica, Demonstration of Dental Mechanics, £5 5*s.* each. Hospital Practice to registered practitioners by special permission of Committee, 12 months, £15 15*s.* The Committee also consider applications from medical men who may desire to attend the Anæsthetic Room *for a course of* instruction in Nitrous Oxide administration. Information respecting the Hospital Practice and the College may be obtained from the Dean, Mr. Sidney Spokes, who attends at the Hospital, Great Portland-street, on Tuesday mornings.

Guy's Hospital.—The work of the Dental Department begins daily at 9 A.M. both in the extraction rooms and in the conservation room. *The Extraction Rooms*: Patients are admitted between 8.45 and 9.30 A.M., and are seen by the dental surgeon for the day, the dental house surgeon, the assistant dental house surgeon, and the dressers. Such cases as are suitable for conservative treatment are transferred to the conservation room, taking with them a dental chart to indicate the treatment required. *The Conservation Room*: This room is open from 9 A.M. till 5 P.M. There are 55 Morrison chairs, each fitted with a saliva ejector, for the use of the Dressers, who, under the supervision of the Staff, perform the various operations of Dental Surgery. The members of the staff attend every morning and afternoon in the week to give demonstrations and otherwise assist students in their work in the Conservation Room and Mechanical Laboratory. Dental students have the opportunity of attending concurrently at this hospital the two *courses of instruction* required by the examining board for the L.D.S. Eng., viz., the special lectures and practice of the Dental Department and the general lectures and practice of the Medical School. The fees for these two courses may be paid separately or together, or they may be combined with the fees required to be paid for the course for a medical diploma. Students who enter for a medical as well as a *dental diploma* are allowed to pursue their study of Dentistry during any period of their medical course most convenient to themselves without further charge. Two Entrance Scholarships in Dental Mechanics of the value of £20 each are offered for competition annually, one in September and one in April, and prizes of the aggregate value of £35 are awarded for general proficiency and skill in Practical Dentistry. Dental students are eligible for admission to the Residential College and enjoy the other social privileges of students in the Medical School.

Staff. — Dental Surgeons: Mr. W. A. Maggs, Mr. Wynne Rouw, Mr. H. L. Pillin, and Mr. M. F. Hopson. Assistant Dental Surgeons: Mr. J. B. *Parfitt and* Mr. J. L. Payne. Demonstrators of Practical *Dentistry*: Mr. E. B. Dowsett, Mr. F. J. Pearce, Mr. H. P. Aubrey, Mr. H. Chapman, and Mr. H. C. Malleson. Anæsthetists: Dr. H. F. Lancaster, Mr. C. J. Ogle, Mr. E. C. Hughes, Mr. A. R. Thompson, Mr. W. M. Mollison, and Mr. R. Davies-Colley. Lecturers.—Dental Surgery and Pathology: Mr. Wynne Rouw. Dental Anatomy and Physiology: Mr. Maggs. Operative Dental Surgery: Mr. Parfitt. Dental Mechanics: Mr. Payne. Practical Dental Mechanics: Mr. Pillin. Dental Materia Medica: Dr. A. P. Beddard. Dental Bacteriology: Dr. Eyre. Dental Microscopy: Mr. Ryffel and Mr. Laidlaw. Metallurgy: Dr. J. Wade. *Practical* Dental Metallurgy: Mr. Hopson. Curator of Dental Museum: Mr. Dowsett. Dean: Dr. Eason.

London Hospital.—Mr. F. M. Farmer, Mr. J. Scott MacFarlane, and Mr. H. Watson Turner give practical instruction during the winter and summer sessions daily at 9 A.M. Dental Dressers must undertake to attend regularly for three months. A course of lectures, specially arranged for Medical students, will be delivered during May and June. The lectures will be supplemented by demonstrations of practical work and will be specially directed to meet the requirements of the medical practitioner. It will comprise a short description of the Anatomy and Physiology of the Teeth, special attention being given to Oral Hygiene; Irregularities of the Teeth, with special reference to cases which may be treated by surgical means as distinguished from those requiring dental appliances; Dental Caries and its Treatment, which will be specially directed to palliative dressings and simple fillings; Diseases of the Dental Pulp and Periosteum and their Treatment; and Neuralgia and other Affections arising from dental causes. The practical work will include exercises in the extraction of teeth and the preparation of cavities and simple fillings on models specially prepared. 8569 dental cases were treated during 1907.

PROVINCIAL.

University College, Bristol.—Laboratories for instruction in Mechanical Dentistry and in Dental Metallurgy have been established in the *College and Dental* students can enter for the full curriculum at Bristol. The Lectures are delivered at the College. Practical instruction *is given at the Royal Infirmary* by Mr. Ackland and at the *General Hospital* by Mr. Genge, both institutions being recognised by the *Dental* Board of the Royal College of Surgeons of England. Full information may be obtained of the Dean of the Medical Faculty, Professor Edward Fawcett, University College, Bristol.

Devon and Exeter Dental Hospital, 24, Southernhay, West, Exeter.—Established 1880.—The hospital is open daily (Sundays excepted) and patients are admitted between the hours of 9 and 11 A.M. Students attending the practice of the hospital must consider themselves strictly under the control of the medical officers and must not undertake any operation without the consent of the dental surgeon for the day. Hon. treasurer, Mr. J. M. Ackland; secretary, Mr. W. Alfred Hooker.

SCOTLAND.

The Incorporated Edinburgh Dental Hospital and School.—The Edinburgh Dental Hospital and School is located in a spacious and well-equipped building at 31, Chambers-street and offers special advantages to dental students.

muscle is shown by graphic records. 2. Studies of the Relationship between Respiration and Blood Pressure. Part I.: The Effect of Changes of Intrapericardial Pressure on Aortic Pressure, by Thomas Lewis, from the Physiological Laboratory, University College, London. The author in this part shows that the heart is peculiarly susceptible of the changes of pressure external to it. In small cats the rise of blood pressure accompanying suspended or prolonged inspiration is entirely due to the change of intrapericardial pressure. In larger cats this has not been so clearly ascertained. Nevertheless, it is certain that increased diastolic filling of the heart plays a large part in causing the inspiratory rise of blood pressure in these animals. Part II.: Facts bearing on the Relationship of Different Factors in the Production of Respiratory Curves of Blood Pressure. In this part the author shows that in man a deep intercostal inspiration which is not prolonged yields a pure fall of blood pressure. A deep diaphragmatic inspiration which is not prolonged gives a pure rise of blood pressure. In expiration the reverse effects hold. 3. Note on the Supposed Existence of Vaso-constrictor Fibres in the Chorda Tympani Nerve, by W. M. Bayliss, from the Physiological Laboratory, University College, London. Mr. Bayliss, to test the statements of M. Fröhlich and M. Loewi, which seemed to demonstrate the presence of vaso-constrictor nerve fibres in the chorda tympani and therefore to invalidate the experimental results of many previous investigators, placed cats under the influence of amyl nitrite and sodium nitrite, and states that he has been unable to obtain any results which would warrant the interpretation of their being due to the pressure of vaso-constrictor fibres. Tracings are given of the action not only of animals under the influence of the abovementioned drugs but also of pilocarpine and atropine. Mr. Bayliss appends to this article a note on the excitation of vaso-dilator nerve fibres in depressor reflexes. Various experiments are described and tracings shown, the results of which demonstrate, he believes, that in addition to the generally assumed action of the depressor nerve—viz., that it produces fall of blood pressure by inhibition of tone of the vaso-constrictor centre—there is also an excitation of the vaso-dilator nerves. 4. A Criticism of the Nitromolybdate Method for the Detection of Phosphorus in Tissues, by G. G. Nasmith, Ph.D., and E. Fidlar, B.A., M.B. The authors agree with Bensley that the reduction of compounds of molybdenum is the cause of the blue-green colour which appears in the sections and that it is not due to the presence of phosphorus at all. This number also contains the Proceedings of the Physiological Society for June 20th and July 18th, 1908.

The Biochemical Journal. Edited by BENJAMIN MOORE, M.A., D.Sc., and EDWARD WHITLEY, M.A. Vol. III., Nos. 6, 7, and 8. August 10th, 1908. Published by the Biochemical Department, University of Liverpool. Annual subscription, 15*s.* per volume of 480 pages.—The contents of this part are: 1. The Effects of Variations in the Inorganic Salts and the Re-activity of the External Medium upon the Nutrition, Growth, and Cell-division in Plants and Animals, by Benjamin Moore, M.A., D.Sc.; Herbert E. Roaf, M.D. Tor.; and Robert E. Knowles, M.D. Liverp. The authors find that in plants a very moderate degree of acidity represses growth and stops cell-division, whilst short of the lethal dose there is marked stimulation by alkali. The kation present appears to have a specific effect and potassium is much more stimulating than sodium to both rootlets and foliage. The phosphatic *anion* has a special effect upon the flower causing increase in size, irregular inflorescence and packed florets. The cytological effects are shown in numerous illustrations of hyacinth rootlets. With acid solutions there are absence or depression of *nuclear division* and thickening of the cell walls; with the alkalies, increase in nuclear division, changes in chromosomes, and irregular figures are visible and the cell outlines become obscured. The effects of the two agents in animals are also described. 2. An Investigation of the Toxic Actions of Dilute Solutions of the Salts of Certain Heavy Metals as Copper, Iron, Nickel, Cobalt, Manganese, Zinc, Silver, and Lead, upon the Bacillus Typhosus with a view to practical application in the purification of shell-fish, by Benjamin Moore, M.A., D.Sc., and James Leonard Hawkes, M.D. Liverp. 3. Note on the Chemical Composition and Physical Properties of Renal Calculi, by J. Sydney Rowlands, M.D. Liverp., Thelwall Thomas Fellow in surgical pathology. 4. On the Presence of an Oxidising Enzyme in the Latex of Hevea Brasiliensis, by D. Spence, Ph.D., A.I.C. 5. Experimental Evidence of the Local Production of "Opsonins," by H. Leith Murray, M.D. Aberd., R. Stenhouse Williams, M.B. Edin., D.P.H. Camb., and J. Orr, L.R.C.P. & S. Edin., D.P.H. 6. Experimental Inoculation of Meningococcic Vaccine, by R. Stenhouse Williams, M.B. Edin., D.P.H. Camb., H. Leith Murray, M.D. Aberd., and J. Orr, L.R.C.P. & S. Edin. 7. Changes in the Chemical Composition of the Herring during the Reproductive Period, by T. H. Milroy, professor of physiology, Queen's College, Belfast.

The Edinburgh Medical Journal.—In the August issue of this magazine, the second number of the new series, Sir G. T. Beatson records two cases of Intussusception in Infants in which the appendix vermiformis was included in the tumour. In one case the appendix needed removal as the result of the strangulation from which it had suffered. In an interesting paper on Vaccine Treatment in Surgery Mr. H. M. W. Gray reiterates his belief that opsonic determinations are not indispensable for the due administration of tuberculin T.R. He reports that in some 200 cases in which this remedy was used he noted six in which distinct harm resulted and a number in which no effect either way was noticeable; in the great majority good ensued. He recommends the use of tuberculin in early cases, such as enlarged glands of doubtful nature, as a precautionary measure. Dr. H. G. Langwill gives notes of two cases of Fainting Fits, apparently due to accumulation of blood in the splanchnic system, the patients being cured by the application of an abdominal binder; and Dr. John Eason writes on Mechanical and Orthostatic Purpura and expresses the belief that many cases of this disorder are due to rupture of capillaries by simple pressure and are not toxic in nature.

The Dublin Journal of Medical Science.—In the August number appears the first part of Mr. E. Hastings Tweedy's annual report of the Rotunda Hospital. Dr. Walter G. Smith writes on Oxaluria and Phosphaturia. He shows that the oxalic acid excreted is partly exogenous and partly endogenous in origin and concludes that the appearance of this substance in the urine is of surgical interest as a component of calculi rather than of medical importance as a sign of metabolic irregularity, while the phosphoric acid of the urine is almost entirely exogenous and is only of clinical importance in the form of juvenile phosphaturia. Dr. Reginald Holmes commends Calmette's ophthalmic reaction as a valuable test for tuberculosis and Dr. A. F. G. Kerr gives a short epitome of our knowledge of protozoal diseases in man.

The Medical Chronicle.—The original matter contained in the August number of this magazine consists in a first instalment of some lectures on the Pathology of Cancer by Mr. Charles Powell White. He classifies tumours as organ tumours, or organomata, tissue tumours, or histiomata, and cell tumours, or cytomata. This classification leads to a distinction being drawn between the epitheliomata and the carcinomata, the former term being applied to various kinds should possess such a qualification. In 1905 the Fellows and members of the Institute, now numbering nearly 2000, decided to create a central public health institution in London and have erected bacteriological, parasitological, and chemical laboratories in which researches of a public-health character are undertaken for municipal and other authorities and for private medical practitioners and the necessary training for obtaining public health diplomas is provided, together with a library, lecture room, and common room. The Royal Institute of Public Health is recognised by the University of London as a public educational institution, and its course of instruction for the diploma by the universities and other examining bodies of the United Kingdom. The Institute is under the patronage of His Majesty the King, and the Right Hon. Lord Strathcona and Mount Royal *is President*. The teaching staff consists of—the Principal, Professor William R. Smith, M.D., F.R.S.E.; lecturer on parasitology, Dr. Louis W. Sambon; demonstrator of chemistry, Mr. C. E. Harris, Ph.D.; demonstrator of bacteriology, Dr. Carl Prausnitz. Occasional lectures are given by eminent sanitarians. The Harben lecturer for 1908 was Professor G. H. F. Nuttall, F.R.S., of the University of Cambridge, and the Harben lecturer for 1909 is Professor R. Pfeiffer, M.D., Königsburg.

THE BRITISH MEDICAL MAN ABROAD.

THE conditions of medical practice have much altered in this country of late, as we have been able to point out in THE LANCET during the past decade. Professional incomes *in* many places have been lowered seriously by the unfair tactics of so-called medical aid societies, and the position of servant to which some of these associations would reduce their medical officer is one that liberally educated gentlemen do not welcome with enthusiasm. Improvement has taken place recently but there is yet a time of severe struggle ahead. Again the expenses of living have gone up for medical men as they have *for all the middle* and upper middle classes of this country, while more money is required to secure the necessary *medical degrees and* diplomas owing to the lengthy curriculum and the more expensive equipment. These facts account, though only partially, for the increased number of medical men who having *obtained* British medical qualifications desire to settle abroad. Other factors at work are the spirit of adventure, the *feeling* that in a new country there is more elbow-room and more chances of getting out of *the ruck*, and the *increased* facilities of transport. Newspapers *and books* galore nowadays make us familiar with life in other lands, while trains and steamers will take us all over the world in a short time and at a comparatively small expense. For this reason or that, the number of medical men who make inquiry from us as to their legal and *professional* position in a *foreign* country continues to increase, and in the following columns we attempt to give the information.

Speaking generally, our colonies make it easy for medical men from home to practise there, but the same is not the case on the continent, where there is an obvious tendency towards protection. But *in the colonies* there are not many openings for practice except for those who are willing to "rough" it and work hard. *In Canada* there are outlying districts where a good start might, perhaps, be obtained; but it must be *remembered* that Canada possesses advanced medical schools and is a sparsely populated country as yet. In *Australia and* New Zealand the prospect for the British practitioner is not greater than that which faces him in Great Britain. The medical profession is, in fact, crowded in all places at home and abroad where the circumstances of practice are favourable, and many practitioners who have gone out from the mother country have had to leave the colonies unsuccessful, or have been very hard pushed to make both ends meet. The graduates of the colonial universities every year tend to more than meet the usual vacancies. It used to be *generally* believed that, even where there was a large supply of general practitioners in the big colonial towns, there *would still* be good *openings* for men who have specialised in such branches of practice as the treatment of eye and ear diseases. This is partially true. There are openings of which good men can take advantage. But as a rule the openings *in the* colonies for *new* comers are in country *districts* where the medical man, besides being proficient *in every branch of the* profession, must be ready to lead a hard life. It is desirable that every colonial practitioner, intending to start in a country district, should be of good physique and not only able to ride but able to take care of his horses.

There are, of course, certain colonial appointments made in this country particulars of which will be found in our columns. These appointments are sometimes made with permission to practise privately, and sometimes this is not permitted. Candidates for the posts should apply to the Colonial Office for information, and their chances of success will be much increased by having passed through one of the schools of tropical medicine. The duties of colonial medical officers involve medical charge of a district, including as a rule the charge of a hospital and a lunatic asylum. The medical officers also supervise the sanitation of their districts, and as a rule give gratuitous attendance to all Government officials.

The United States of America form a rich and well-populated country to which, as speaking our language, it is natural for the British medical man to desire to go. The regulations for practice in the various States differ much, but it will be found that wherever the social conditions are pleasant and the opportunities for emoluments good there will be plenty of competition. There is an enormous number of medical men in the United States, and the British medical man contemplating starting in medical practice there will be prudent to make full inquiry before deciding on the locality, while his chance of success will be increased by *his having some good introductions*.

FRANCE.

The law that regulates the conditions of the practice of medicine in France is that of Nov. 30th, 1892, passed by the *Senate and the Chamber of Deputies* and signed by Carnot, President, and Poincaré, the Minister of Public Instruction, at that date:—

> No one may practise medicine in France unless he hold a diploma of the doctorate of medicine given by the French Government after examinations duly passed in a State institution of higher medical education.

The fifth article of this law specifically refers to foreigners:—

> Physicians who have taken their degree abroad, of whatever nationality, can only practise in France on condition of having obtained in France the degree of doctor of medicine.

This article was modified by a special decree, signed in July, 1893, referring to certain concessions to be made to such foreigners:—

> Physicians with a foreign degree who desire the French degree of doctor of medicine may obtain partial or complete dispensation of medical study and partial exemption from the examinations required. In no case will candidates be exempted from more than three examinations. Such exemption is accorded by the Minister of Public Instruction on the recommendation of the competent Faculty and the Committee of Public Education.

While this last quotation may be considered the actual *state of the law in the formal* sense of the word, further and much less liberal projects have since been considered by the legislative bodies and adopted in the form of *arrêt ministériel*, of *circulaire* issued by the Minister of Public Instruction, or of *décrét* adopted by Parliament. Presumably too much advantage was taken of the *generosity of the concessions of* July, 1893, although it must be remembered that the exclusive policy since adopted is by no *means aimed* at English physicians, but rather against graduates of little-known universities the value of *whose qualifications it is* difficult to estimate. Be that as it may, in July, 1896, a certain number of exemptions *were granted—among* whom the writer was fortunate to find himself—and a circular was issued repealing —in substance—*the concessions of 1893*. No foreign qualifications were to be recognised as deserving of any dispensa*tions and physicians holding* foreign degrees and desirous of practising medicine in France were obliged not only to *matriculate* as medical students but also to produce evidence of having obtained the French diploma of Bachelor in *Classical Education* (Arts and Philosophy) and *the certificate* in physical, chemical, and natural science.

The refusal that for the last ten years has almost invariably met the request made by foreign physicians *for* the right to practise in France is based upon this *arrêt ministériel*. Such requests are answered in the *formula*—"Depuis 1896, époque à laquelle il y a eu une décision du Parlement, il n'est accordé aucune dispense aux étrangers showing both kidneys and liver to be very fatty and necrotic changes to be present in the mucous membranes.

Dr. W. J. DIXON (Templecombe) in 153 cases had found acetone in 28 per cent. and diacetic acid in 14 per cent. The condition was associated with septic absorption and the administration of salicylate of sodium. Of 43 instances of acetonuria, serious toxæmia occurred in 27. The causes of acidosis appeared to be auto-intoxication in gastro-intestinal disorders, a specific organism, excess of carbohydrate or fatty food, starvation, anæsthetics, and those without discoverable origin, which might be termed cryptogenic. Fatty degeneration and lipæmia occurred in diabetes, carbohydrates being necessary to the complete disposal of fats. The poisons were the products of imperfect oxidation.

Dr. E. I. SPRIGGS (London) cited the observation of Nothnagel that the appearance of fat in organs after anæsthetics was due to its being more obvious, and was not necessarily an actual increase proved by chemical analysis. Waithman had shown that excess of fat was present in the liver of dogs after chloroform poisoning. A fatty condition of the liver was normal in starvation, which was a cause of acidosis in children and was a necessary consequence of gastro-intestinal disease. The loss of fluid involved in diarrhœa and vomiting was itself a serious thing. The treatment in children should consist in washing out the stomach and supplying fluid, alkali, and food if necessary by the rectum or skin.

Mr. HAROLD J. STILES (Edinburgh) said that post-anæsthetic acidosis or delayed chloroform poisoning occurred in something like 1 in 500 cases. It was a serious condition and not sufficiently recognised. He cited instances of two adults succumbing in four or five days after simple operations for appendicitis performed under chloroform in which the post-mortem appearances were typical. In septic abdominal conditions ether was usually preferred in America. The acidosis was not entirely traceable to the quantity of chloroform employed and sometimes the condition followed the most trivial operations. Anæsthesia might delay elimination, hinder oxidation in the tissues, and accentuate the pre-existing state which was associated with sepsis.

Dr. STUART MCDONALD (Edinburgh), speaking of the post-mortem appearances, said that in cases examined recently the liver was small, bloodless, bright yellow in colour, and intensely fatty. There were hæmorrhages over the heart and lungs, such as occurred in phosphorus poisoning. Leucin and tyrosin had been present in the urine, in which the urea nitrogen was diminished and the ammonia nitrogen increased. In such cases where deep jaundice developed the outlook was hopeless. The liver in late chloroform poisoning showed an increase of fat, whereas in acute yellow atrophy the fat was diminished.

Mr. B. G. A. MOYNIHAN (Leeds) said that though there was too much starvation of patients both before and after operation, water at least should not be withheld, but should be given abundantly during vomiting by the rectum, when the stomach should also be washed out. Ether was preferable to chloroform when operating on septic abdominal cases. Gas and oxygen had been given in one case for an hour and 40 minutes.

Dr. J. B. LEATHES (London) said that in cases in which vomiting, acetonuria, and death followed the administration of chloroform the fat in an exceedingly fatty liver resembled that in connective tissue. Fat ingested passed mostly by the thoracic duct. In cases of poisoning the fatty change was very rapid, occurring within 24 hours.

Dr. F. A. BAINBRIDGE (London) said that the first process of metabolism involved the conversion of the saturated connective tissue fats into the saturated fat of the liver and a second process concerned the burning up of fat in the body. Interference with this latter produced acetonuria. Impaired oxidation of fat in muscles caused accumulation of fat in the liver, which could therefore be excluded as the cause of symptoms. Chloroform exerted an action similar to phosphorus in arresting oxidation.

Dr. F. S. LANGMEAD (London) said that deferred anæsthetic poisoning affected persons apparently well previously, causing well-defined symptoms with acetonuria and death in two or three days, the appearance of the liver after death being characteristic. The condition depended on impaired oxidising power aggravated by the anæsthetic.

Dr. W. P. KENNEDY (Bath) attributed the intoxication to imperfect oxidation of carbon.

Mr. SYDNEY STEPHENSON (London) made some remarks upon

Interstitial Keratitis with Especial Reference to Pathogenesis and Treatment,

pointing out that interstitial keratitis was, relatively speaking, not a common affection of the eyes; that its greatest incidence occurred between the ages of five and 15 years; that females were more often affected than males; and that syphilis (inherited or acquired) accounted for about two-thirds of all cases. Experimental evidence went to show that the disease was due to the presence in the parenchyma of the cornea of the causal agent of syphilis. The curious latency of the disease was to be explained by the diffusion of the organism known to occur in syphilitic babies. Spirochæta pallida had been found in the seemingly healthy tissues of the eyes of syphilitic infants and fœtuses by Bab, Peters, Gierke, Stock, and himself. Interstitial keratitis in Mr. Stephenson's experience was little influenced by the administration of specifics, but he had found atoxyl, given in conjunction with mercury, to be a most efficacious remedy. Cases were quoted in which comparatively rapid cures had been obtained by those means. Mr. Stephenson advocated the intra-muscular injection of doses of 0·25 to 0·50 gramme (i.e., 3¾ to 7¾ grains) of atoxyl once a week in mild cases and more frequently in severe ones. Not more than six grammes should be given in all, and a course of 12 injections usually sufficed to cure or almost to cure the cases.

Dr. FRANK C. EVE (Hull) and Dr. J. M. CLEMENTS (Hull) described

The Two Clinical Types of the Meningococcus and their Bacteriological Differentiation,

illustrated by three sporadic cases. Until recently it was considered that the presence of a Gram-negative diplococcus in the cerebro-spinal fluid was sufficient evidence of epidemic cerebro-spinal fever, but it now appeared that there were two such organisms (at least) which could be distinguished bacteriologically. Since the one type of diplococcus produced the dreaded "spotted fever" and the other type the posterior basic form of meningitis, which was endemic in this country but apparently never epidemic, it was obvious that their prompt and certain bacteriological differentiation was of considerable clinical importance. The paper was based on the detailed study of three sporadic cases and a tabular statement of their points of agreement and difference with the epidemic type of coccus was printed and handed round to the meeting. The two types of coccus and the diseases resulting therefrom were found to be indistinguishable, except in the following respects: (1) cultural, (2) agglutinative, (3) phagocytic, and (4) clinical.

1. *Cultural differences.*—The sporadic organism generally grew (*a*) on agar, often very freely; (*b*) on gelatine; (*c*) at room temperature; (*d*) had considerable vitality; and (*e*) often formed on agar abundant moist, iridescent, coalescent colonies which might be sticky enough to draw out into filaments three inches in length.

2. *Agglutinative differences.*—The sporadic organism did not agglutinate with the patient's own serum nor with the serum of an epidemic case (Houston)t nor with the antiserum of Flexner and Jobling, but it would sometimes agglutinate with the serum from another sporadic case.

3. *Phagocytic differences*—The sporadic organism showed little or no tendency towards engulfment by the polymorphs in normal blood or that of the patient of an epidemic case. This with the absence of agglutination combined to make the opsonic index extremely low in comparison with that of the epidemic coccus. In the cerebro-spinal fluid also *intra*-cellular cocci were never abundant.

4. *Clinical differences.*—The sporadic type never showed skin eruptions (which, however, were frequently absent in the epidemic form), and in the case in which they tried the new antiserum of Flexner and Jobling[1] the effect was unfavourable.

The purpose of the paper was to show that by the help of lumbar puncture and the laboratory the insufficient clinical differences might be supplemented and a decided and prompt opinion given as to which of these two organisms was at work—in times of scare a most important verdict. Since the cultural differences were liable to be young German before commencing the study of medicine must pass an *Abiturienten-Examen* requiring a knowledge of French, Latin, Greek, mathematics, history, and theology. Or the examination of a *Real-Gymnasium* or an *Oberrealschule* may be passed. In the latter event more stress is laid on modern languages, mathematics, and natural history, and English is required instead of Greek. Foreigners have, as a rule, to pass this examination, but if they have already passed a similar one in their own country they may be exempted from it by a special order to be obtained from the Minister of Public Instruction for each individual case. Medicine can only be studied at a university; the curriculum lasts five years, after the second of which the examination called the *Tentamen Physicum* must be passed; it includes anatomy, physiology, chemistry, physics, and natural history. After the end of the fifth year the student presents himself for the "State Examination," which is practical as well as theoretical, and includes medicine, surgery, obstetrics, gynæcology, pathology, materia medica, and hygiene. After passing the State examination the medical man, previously to obtaining his qualification, has to perform his practical year as clerk and dresser at a university clinic or a recognised hospital. If the medical man wishes to have the title of "doctor" he has to pass another examination, which is little more than a formality, but the degree of doctor without the State examination does not legally confer the right to practise. This title of doctor is granted by every German university to foreigners, but the conditions differ according to the university. Some universities demand a special course of study and others do not, and the intending candidate must in every case make inquiries of the authorities. The law does not allow qualified British practitioners any exceptional facilities in passing the examinations: the time of study may possibly be made a little less than five years for those who have already studied abroad, but a special order, very difficult to obtain, is always required for this purpose. A thorough knowledge of German is essential. The fees for lectures are at least £130 and the examination fees about £12. The fees for the degree of M.D. vary from £10 to £20, being highest at Berlin University, which is the degree that is most popular with alien medical men. There is sometimes no prohibition set against holders of British diplomas practising in Germany provided they do not make use of any professional titles resembling those of qualified German medical men. Medical men practising in this way must, however, understand that the law regards them as unqualified and that they have none of the rights or privileges of the medical profession.

---

[1] This serum, which is not yet on the market, Dr. Eve and Dr. Clements owe to the kindness of Dr. A. G. Robb of Belfast. In his cases it reduced the mortality from 82 per cent. to 26 per cent.

AUSTRIA-HUNGARY.

In order that foreigners may legally practise medicine in Austria it is necessary for them to become naturalised Austrian subjects which necessitates five years' residence in the country. In special cases the Minister of the Interior, conjointly with the Minister of Education, may grant exemptions from that rule and may permit foreign holders of diplomas to practise in Austria if they comply with the other requirements. These are: The production of a so-called Maturitätszeugnis or certificate of having passed the final examination of the gymnasium, at which the candidate must show a satisfactory knowledge of Latin and Greek, as well as of German or one of the other languages spoken in the Austrian Empire, such as Polish, Bohemian, Italian, also of mathematics, history, natural history, chemistry, and physics. If a British medical man or student has passed a similar examination in his own country he may apply for exemption, which is generally granted; he need only produce proof of his having passed such an examination, in the shape of a certificate, to be translated into German by a properly recognised translator. The medical curriculum lasts 11 semesters, or five and a half years. The holders of foreign diplomas may, however, obtain permission to pass their examinations at shorter intervals than are necessary for the students, so that from 18 months to two years may be reckoned as sufficient. After passing the first theoreticum, or first examination, which comprises biology, anatomy, physiology, and chemistry, and which, as a rule, is passed at the end of the fourth semester, the student is allowed to commence hospital work; at the end of the tenth semester he may present himself for the second theoreticum. This and all other examinations (altogether three in number) are both practical and theoretical, and must be completed within eight days. It comprises internal medicine, surgery, and pathology, whilst the third and last examination comprises gynæcology, obstetrics, hygiene, materia medica, and ophthalmology; pædiatrics, otology, dermatology, and laryngology are examined in alternately. This last examination the student is expected to pass not later than five years after the first, otherwise he has to present himself again for certain subjects of the first examination, especially anatomy. The fees for the three examinations are £15, and then comes the fee of £6 5s. for the degree of M.D., without which degree nobody is allowed to practise. The fees for the lectures are about £35 for the five years, and about £15 for special classes may be added, so that the entire cost of obtaining the degree of M.D. would be from £70 to £75. All the universities confer the degree of M.D., and no distinction is made here as regards the place where the title has been gained, although the University of Vienna is most favoured because it offers the best opportunities for studying. In special cases the Minister of the Interior may allow a foreign qualification to be recognised as entitling its holder to practise, only a mere formal examination being required; such a special order is, however, very difficult to obtain. The examinations are entirely oral and are conducted in various languages according to the locality—namely, German in Vienna, Innsbruck, Graz, and Salzburg; German and Bohemian in Prague, and Polish in Cracow and Lemberg. These seven universities are the only ones in Austria, and only they may grant degrees, as the medical schools are invariably integral parts of the universities. If a British medical man wishes to practise in one of the frontier spas or in Karlsbad he will have little difficulty in obtaining permission to do so if he applies for it, especially if he gives an assurance that he will only attend his fellow-countrymen and only for the season. He need not then obtain official recognition of his diploma.

As regards Hungary, the medical curriculum is for practical purposes similar to that in Austria, and the foreigner, whether a holder of a diploma or a student who wishes to practise legally, must become a naturalised subject and must pass the three above-mentioned examinations in the Hungarian language. Applications for admission must be addressed to the Minister of Education, who decides upon the conditions of admission after consultation with the medical faculty of Budapest. Usually the applicant has to pass three medical examinations after having proved his qualification for admission by a Maturitätszeugnis, or testimonial of sufficient preliminary instruction in two classical languages, chemistry, arithmetic, geometry, and physics. The total fees amount to 295 kronen (about £12), and the fee for "promotion"—*i.e.*, for the M.D. degree—is similar to that in Austria. Besides the university in Budapest there is another university in Klausenburg for which the same rules hold good. Only these two universities may confer medical degrees in Hungary.

DENMARK.

In Denmark only those who have passed the Danish Medical Examination are entitled to practise. In Iceland it suffices to have been examined at the Medical School in Reykjavik. The medical student before beginning his studies must present a diploma of *examen artium*—an examination very similar to the German *Abiturienten examen*. At the close of the first year he must pass an *examen philosophicum*. The medical studies proper require from six to seven years. The foreign student will find one agreeable difference from what is customary in other countries—namely, that all University lectures and clinical courses are free, payment of class fees being unknown, but a few pounds are required for the examination. On passing the examination the young man becomes entitled to practise, and not a few commence at once. The majority, however, prolong their practical training by accepting an appointment as (salaried) junior house physician or house surgeon in one of the numerous hospitals of the country. The most highly valued appointment—namely, those at the Kommune hospital or Royal Frederic Hospital of Copenhagen—are, however, in so great demand that not rarely four, five, or even more years elapse before an aspirant can secure the coveted position, when he serves for one or two years in the different departments of the hospital. This unreasonably long waiting time will presumably ere long be considerably reduced, as the Association of Junior Medical Men has arranged with the faculty and other authorities for the establishment of a larger number of appointments, which are to be officially considered as equivalent to the older appointments at the two hospitals.

from two to six weeks. During the whole period of early life from six months to two years active processes of absorption and eruption were progressing. As at eruption only a part of the tooth was formed very slight opposition would deflect the tooth. Eruption did not depend on elongation of the root, no gum tension was produced, and no great display of force was present. Sections of the tissues over an erupting molar which had not yet cut the gum but was through the bone, showed a delicate layer of epithelium quite normal in appearance. If pressure existed this epithelium would be flattened and there would be signs of inflammation present. When a permanent tooth was prevented in its eruption by a retained temporary tooth, due to incomplete absorption of the temporary tooth, the molar was unable to displace the temporary tooth, but twisted sideways or backwards as shown by the curving of its roots. Specimens and slides were shown illustrating these points. There was no evidence of teething troubles occurring in animals. There were very few traditions among native races of the association of disease with the process of teething. Mr. Turner then went on to analyse the so-called teething troubles. He had made careful inquiry amongst well-to-do parents of the dental histories of their babies; in all 37 cases were inquired into. Of these 22 had no illness attributed to teething, and 15 had suffered from various diseases. Most of the infants were partially bottle-fed, but the bottles were in practically all instances carefully cleaned. Of the 15 children who were ill there were eight cases of bronchitis: five of these were associated with adenoids, one with rickets, leaving two in which bronchitis coincided with teething; four cases of sickness or liver attacks, one of summer diarrhœa, and one of screaming fits were stated to have occurred. Of the 37 cases 13 showed excessive salivation. Mr. Turner was unable to find any evidence in the series of cases inquired into that the disorders were in any way directly referable to teething.

Dr. Evelyn S. Milestone (Sheffield) said that dentition was a normal process and one following a normal course in children properly fed and clothed and cared for, but that the physiological state of the child during dentition was one of unstable equilibrium and liable to be altered by very slight causes. Earache, often wrongly attributed to dentition, was not uncommonly, in infants, due to local causes. It was some 25 years since the speaker had lanced a child's gums; on that occasion the convulsions ceased immediately after the incision, but a few hours after were as serious as ever.

Dr. C. Christopher Heywood (Manchester) said that he agreed with practically all that Dr. Guthrie had said. As physician to the Manchester Children's Hospital during the last few years he could find no instance in which he had diagnosed teething as a cause of disease symptoms. Cases of painful dentition, of course, he had treated in great numbers, but no case in which the painful dentition was not preceded by other complaints, especially catarrhal or septic conditions of the mouth. He had never seen convulsions, diarrhœa, bronchitis, &c., attributable to dentition.

Mr. P. Sidney Spokes (London) agreed as to dentition being a normal process, but had noticed purposeless cough, such as so-called ear cough, as each tooth came through, whilst convulsions were admittedly caused by septic poisoning. He also thought that such a manifestation might be a reflex result of peripheral irritation, and if this was admitted it was only a question of the degree of irritation necessary. He had seen cases where there appeared to be marked swelling over developing and erupting teeth and no septic infection. In such cases lancing the swollen gums had been followed by relief.

Mr. C. Edward Wallis (London) said that at Darenth Asylum years of careful record had been kept of the incidence of fits before and after the children's mouths had been made free of all dental irritation. The records gave no evidence of a diminution in the number or severity of fits as the result of dental treatment. Pain following or accompanying eruption of a wisdom tooth was, of course, due to septic processes.

Dr. J. Sim Wallace (London) considered in common with previous speakers that dental troubles associated with teething were generally of a septic nature and predisposed to, if not actually caused, by improper feeding.

Mr. R. Denison Pedley (London) had had little experience in the early period of infancy when consultation was sought for teething troubles. Later in life when the teeth, or only a few teeth, were erupted it was common to find well-marked carious teeth even in infants as young as from 12 to 18 months. As the majority of children were born healthy it was obviously due to some cause of environment, feeding being the predominant factor which was answerable for the condition of the mouth. There was very little trouble with teething in natural feeding.

DERMATOLOGY.

Friday, July 31st.

After the President of the section (Dr. E. G. Graham Little, London) had made a few opening remarks,

Sir Almroth E. Wright (London) gave an extemporary address on

Vaccine Therapy in Relation to Diseases of the Skin.

At the commencement of his speech Sir Almroth Wright remarked that he had nothing new to impart to the Dermatological Section, but he would rehearse the principles of vaccine therapy which he had already made public and answer several criticisms to which his method had been subjected. Vaccine therapy really dated from the inoculation of small-pox in the eighteenth century. Jenner's discovery had carried matters a step further, and Pasteur had by his researches shed light on the *rationale* of those practical experiments. The work done by Haffkine in India on plague and by himself on typhoid fever had greatly widened the sphere of prophylactic inoculation. When it had thus been made evident that immunity could be obtained by prophylactic inoculation methods it had gradually been borne in upon him that this knowledge of protecting by prophylactic immunity could be carried a step further, that when the disease was actually present in the system there still remained a power of resistance which might be called forth by inoculation. Just about that time Koch's tuberculin had been introduced. The object of this method was to destroy the tissues in the immediate neighbourhood of the germs, causing a local necrosis which would be expelled from the body and with it the focus of bacilli would be thrown out, leaving the healthy tissues around unharmed. This method was therefore not allied in any way to that of prophylactic inoculation. Koch had then been called to other work and for the time being had not carried out the next step in tuberculin treatment. When the body was lowered by disease it still retained a certain reserve power of resistance and this was taken advantage of by the vaccine treatment. Small doses of devitalised micro-organisms could call out this resistant power. Cultures were made from the source of infection and from these cultures vaccines were prepared by heating the germs to a degree sufficient only to devitalise not to destroy them. Objectors had inquired how the germs could be devitalised without being destroyed, and how could they act in such a manner as to call forth the resistance of the body? He would answer by giving a simple illustration. The body had the power of throwing off into the blood antibodies or substances which resisted anything which was introduced into the blood. Thus if the white of an egg was introduced into the blood the blood at once began to throw off substances which acted as antibodies to neutralise the white of egg. If, now, the egg were heated to a certain temperature it would be devitalised, no chicken could be produced from it; but if it were introduced into the blood it would still lead to the production of antibodies in the blood. In the same way devitalised microbes introduced into the blood led to the production of antibodies, substances resisting that special form of microbe. To obtain correct results with vaccine therapy it was necessary to administer definite doses, doses which were capable of raising the protective substances in the body to their greatest possible height. The question next arose, how could this dose be measured? How could we ascertain what was the correct dose? The question implied, how could we measure the degree of protective power in the blood of the human body? The protective power of the blood depended on many points, such as (1) the opsonic power of the blood fluid; (2) the agglutinating power; (3) the phagocytic power of the leucocytes; (4) the bactericidal; and (5) the bacteriolytic power of the blood. And even these were not all. As science advanced more would be added to that list. If he were asked whether he would prefer to make a complete or an incomplete evaluation the foreigner. Foreign practitioners depend largely upon shipping and contract business work.

UNITED STATES OF AMERICA.

The laws regulating the practice of medicine in the various States and territories of the United States of America differ to a considerable extent in detail. In spirit, however, they are beginning to assume *that uniformity* which all medical reformers must desire for them. It has long been pointed out that one of the most open doors to abuse of medical practice in the United States was the fact that while in some States an excellent medical curriculum was required before admission to legal practice, in other States but little scientific training was exacted and freedom to practise was extended to dangerous forms of quackery. This position of affairs had its origin, of course, in the evolution of the United States, certain divisions of the country being in the forefront of civilisation while others were, to say the least, in a rudimentary plight; but of late a great process of levelling-up has been witnessed. The progress of the United States is in no way better shown than in the fact that throughout its vast length and breadth there is now an *attempt to* secure for the people of the country adequate medical treatment based on scientific grounds. A *résumé* of the legal regulations for medical practice in the States and territories of the United States of America has been published at the office of the *Journal of the American Medical Association*, Dearborn-avenue, Chicago, Illinois. In this digest of the medical laws of the various States, which has been brought quite recently up to date, existing legislation is explained on broad grounds so far as it pertains *to* medical practice. If the information *with regard* to some particular State is anywhere scanty in detail it is always possible for the intending practitioner to communicate with the secretary or executive officer of the medical board at the capital of the State.

We must continue to warn the British medical man desiring to practise his profession in the United *States of* America that in all the more enviable centres he will find a vast number, almost a plethora, of medical men, *the great* proportion of whom have been thoroughly well educated and trained. He must remember also that in the more important States, generally speaking, although the remuneration may rule high, the expense of living is proportionate. He will understand that the less highly the State is developed the more easy will it be for him to obtain a footing, but *the less* pleasant in all probability will be his professional career.

CANADA.

The Canada Medical Act, 1902, *authorises* the creation of "The Medical Council of Canada" with power to establish a qualification in medicine *entitling holders* thereof to practise in all the provinces of Canada, but no regulations have as yet been issued. As a general rule, the possession of British diplomas and degrees entitles *the holders* to practise in Canada after having obtained a licence *from the* provincial medical boards and paid certain fees.

Ontario.—Registration by the Council of the *College of Physicians* and Surgeons of Ontario is necessary and it is optional for the Council to admit to registration all persons who are *duly* authorised to practise medicine, surgery, and midwifery in the United Kingdom and Ireland upon terms which the Council may deem expedient.

Quebec.—Practitioners must be licensed and registered by the Provincial Board, which may license without examination holders of medical qualifications from British universities or corporations.

New Brunswick.—Practitioners in New Brunswick must be registered by the Medical Council of the province. A candidate for registration (1) must pass an examination in English, arithmetic, algebra, *geometry*, Latin, elementary mechanics, elementary *chemistry*, *history*, geography, and two of the following languages, Greek, *French*, and German, unless he has already matriculated at some college in the United Kingdom, Canada, United States of America, or *Europe, or holds* a first-class teacher's licence from the Board of Education of New Brunswick; (2) he must afterwards have studied for four years and attended some university or college or school of medicine for four sessions of not less than six months each *and* have attended lectures on anatomy, pharmacy, &c.; (3) he must have attended the general practice *of a hospital* for 12 months; (4) he must have obtained a degree in the above subjects from a university, college, or school requiring such four years' course of study or must have passed an examination in them before the examiners in New Brunswick; and (5) he must be over 21 years of age. A fee of $10 is required and medical practitioners are liable to an annual fee of from $1 to $2.

Nova Scotia.—Registration and a licence from the Provincial Medical Board are required, which admits to the privileges of practice, upon payment of the registration fee, all persons who are duly registered by the General Medical Council of Great Britain.

Prince Edward Island.—No one can practise medicine, surgery, or midwifery in Prince Edward Island unless registered or licensed by the Council of the Medical Society of Prince Edward Island. The Council admits to the register any person who is duly registered by the General Medical Council of Great Britain.

British Columbia.—No person may practise medicine, surgery, or midwifery in British Columbia unless registered by the College of Physicians and Surgeons of British Columbia. *The Council admits to the register* any person "who shall produce from any college or school of medicine and surgery, requiring a four years' course of study, a diploma of qualification," on proof of identification and on passing an examination as to his competency. The fee for registration appears to be rather indefinite, as we learn that it "must not exceed $100" and the annual fee is from $2.50 to $10. Licences to practise are issued to women.

Manitoba.—Registration by the Council of the College of Physicians and Surgeons of Manitoba is necessary and applicants for registration must be members of an incorporated medical body in Canada giving similar privileges to persons incorporated in Manitoba. Application should be made to the Council by British medical men desiring to practise in the province. Licences to practise are issued to women upon the same terms as men.

Alberta.—Medical practitioners must be registered by the Council of the "College of Physicians and Surgeons of the Province of Alberta." The Council admits to the register anyone who (1) produces a diploma of qualification from any college or school of medicine and surgery which exacts for such diplomas attendance on at least a four years' course of lectures of at least six months each; (2) gives proof of identification; (3) passes before them a satisfactory examination appertaining to the profession of medicine and his fitness and capacity to practise medicine, surgery, and midwifery; and (4) pays $50, and another $50 for registration.

Saskatchewan.—No one may practise in Saskatchewan unless registered (fee $50) by the Council of the "College of Physicians and Surgeons of the Province of Saskatchewan." The Council admits to the register anyone who produces a diploma of qualification from any college or school of medicine and surgery recognised by the Council, which requires attendance at a four years' course of lectures, and who passes an examination (fee $50) before the Council.

AUSTRALIA.

Legally qualified British medical men can practise *in all* parts of Australia. Proof of registration by the General Medical Council of Great Britain must be submitted to the medical board of the particular State selected, when a certificate to practice is granted. The medical man with British qualifications who desires to *practise in Australia* must communicate with the medical board as soon as he *intends to settle, so that he* may regularise his position from the beginning.

NEW ZEALAND.

Registration in the colony of New Zealand is obtained by the legally qualified British practitioner on producing his *proof of* registration by the General Medical Council of Great Britain and on paying a fee of £1 5*s*.

BRITISH SOUTH AFRICA.

The position of the legally qualified British practitioner in South Africa is much the same whichever colony he *proposes* to practise in.

Cape Colony.—No person may practise in Cape Colony as *a medical* practitioner without a licence signed by the Colonial Secretary of the province and the recommendation of the Colonial Medical Council *is required*. The fee for the licence is £5 and women are eligible for the licence. Applications should be made to the Colonial Medical Council at Cape Town.

Natal.—Here also application *for a licence* to practise medicine in the colony must be made to the Colonial in the clinical wards. The pathologists had given it up as unreliable and unworkable. He had tried the staphylococcus albus in severe forms of bullous erythema in which all cultures had proved sterile, and he had obtained excellent results. He believed that it was safe to try so harmless an organism empirically in cases of skin disease the cause of which was unknown. A case of staphylococcus aureus infection had greatly improved with dosage with the staphylococcus albus. They had also tried very small and gradually increasing doses of tuberculin for tuberculosis of the skin and had obtained very good results. For acne vulgaris he had tried a vaccine made from the bacillus of acne and had found it successful in the nodular forms of the disease. He hoped to publish results of this very shortly.

Dr. A. Douglas Heath (Birmingham) narrated a case of erythematous skin disease due to the bacillus coli which had been cured by vaccine treatment. Nodular resistant cases of acne were sometimes aided by the salt and citrate of sodium local applications, but usually it was necessary to scrape the follicle in order to effect a cure.

Mr. G. Pernet (London) said he had employed various vaccines empirically for boils with very good results so long as he had employed only very small doses. He had worked out a number of hospital cases with Dr. Bunch and called upon Dr. Bunch to describe these in greater detail.

Dr. J. L. Bunch (London) said that he and Mr. Pernet had made experiments on cases suffering from tubercle, streptococcus, staphylococcus, and other germs, and narrated a few cases. He had not obtained good results with general streptococcal infections.

The President of the section observed that he had had greater success with the vaccine treatment of lupus vulgaris than had been obtained by the majority of the speakers.

Sir Almroth Wright, in replying, admitted that the partial evaluation of the blood by the opsonic estimation was not a perfect method of estimating the protective power of the blood, and that in occasional cases the high opsonic index did not coincide with a total high protective power of the blood. He would prefer a method of complete evaluation, but at present it was impossible to obtain such. He could not yet supply any theory which would explain the recalcitrant reaction of lupus to vaccine treatment. In mixed infections it was often necessary to treat with one vaccine at a time and take each in turn. He deprecated the empirical use of vaccines in a great hospital where work should be carried out in a scientific manner; but in private cases it was absurd to withhold treatment until accurate bacteriological investigation and diagnosis had been made. A dose of 100,000,000 staphylococci would in nine cases out of ten cure boils, and this dose could be given by any practitioner with a clear conscience. He agreed with Professor Gilchrist that many cases of acne were due to the bacillus of acne, and a vaccine prepared from it had given excellent results in obstinate cases. He did not approve of the oral administration of vaccines.

Dr. Alfred Eddowes (London) read a paper on

Cases of Eczematous and Bullous Eruptions from which the Diphtheria Bacillus had been Isolated.

He described how his attention had been aroused in January, 1907, by a case which had been diagnosed as ecthyma, but which exhibited a degree of constitutional disturbance out of all proportion to the limited distribution and mild character of the eruption. After a careful examination of several large vesicles Dr. G. Hare, bacteriologist to St. John's Hospital, had obtained the diphtheria bacillus (Klebs-Löffler bacillus) in pure culture. Dr. Eddowes briefly described other cases which had led him to conclude that the Klebs-Löffler bacillus played a more important part in the production of skin diseases than had hitherto been suspected. In one case there had existed an almost generalised weeping, red, and crusted eczema, chronic conjunctivitis, and photophobia. After three years' ordinary treatment this patient had only obtained partial and temporary relief; but as soon as the bacteriological examination had revealed the presence of the Klebs-Löffler bacillus antitoxin treatment had been commenced and had been immediately followed by a most striking and rapid recovery after five injections, each of 4000 units. In all the cases examined by himself and Dr. Hare there had been such a degree of resemblance that they felt that the diagnosis with considerable certainty could be made from the clinical appearances alone. If further experience should prove this to be true a great step would be made towards curing a hitherto unsuspected and most incapacitating malady. Dr. Eddowes hazarded the opinion that this chronic disease was probably a source of danger to other people. In conclusion, he said that the diphtheria bacillus obtained in pure culture from the cases described had been inoculated into guinea-pigs and had caused death after 24 hours, whereas those guinea-pigs to whom antitoxin had been administered together with the organism had remained immune. In two cases a streptococcus had been found associated with the diphtheria bacillus, but it had been of a non-pathogenic nature to animals.

Dr. Frederick Gardiner (Edinburgh) read a paper on

Trade Dermatitis.

He discussed a series of statistics obtained at the skin department of the Edinburgh Royal Infirmary, 185 cases having come under observation in 18 months. The age of the patient seemed, as in the case of accidents, to diminish the risk of dermatitis. The statistics as to periods of time at work, although insufficient for finality to be obtained, seemed to indicate that most cases occurred when the individual had been at work for some years. Miners, housewives, chocolate workers, and rubber workers were at the head of the offending occupations. Seborrhœa and dysidrosis exerted a strong influence, diminishing the resistance of the skin to the irritating material. Most cases came up for treatment in the summer months. The last factor would increase the tendency to excessive perspiration. Debility also increased hyperidrosis. Further illustration of this point was brought out by the number of cases giving histories of anæmia, debility, and influenza. Many cases dated the outbreak from some slight breakdown. Soaps exerted a potent influence both as provocative and causative agents. The alkali in some was bad, the resin in others was worse, but worst of all were the naphtha and paraffin added to some of the newer soaps with a view to the saving of labour. Many patients also aggravated the condition by using irritating remedies, such as carbolic acid, lysol and iodoform. In these days of the Workmen's Compensation Act it was important to remember that persons most liable to be affected were those with seborrhœa or dysidrosis, especially if either condition was accompanied by debility or some more specific disease.

Professor Gilchrist described the dermatitis associated with the poison ivy and the oak, two conditions not infrequently met with in America.

Professor A. Garceau (San Francisco) remarked that he had recently discovered that the application of the Roentgen rays was a most valuable and rapid method of treatment for cases of oak dermatitis. Formerly he had found such cases extremely obstinate and rebellious to all methods of treatment and had been delighted to find how rapidly the symptoms subsided under small doses of the Roentgen rays.

Dr. J. Goodwin Tomkinson (Glasgow) read a paper on

Lupus Vulgaris treated by Systematic Direct Exposure to Unmitigated Sun Rays,

in which he advocated the treatment of lupus vulgaris by daily and lengthy exposure to sun rays in localities where unclouded sunshine and other favourable climatic conditions could be depended upon. He had only treated one case as yet by this method, but the result had been so striking that it merited recording. At the Paris Congress on Tuberculosis held in 1905 two communications had been made dealing with the treatment of lupus vulgaris by unmodified sun rays—one by M. Revillet of Cannes, entitled "Le Traitement du Lupus Tuberculeux et des Scrofulo-Tuberculoses Cutanées par l'Héliothérapie (Exposition Directe aux Rayons Solaires non-Modifiés)"; the other by M. Vidal, entitled "Du Traitement du Lupus Ulcéré et de quelques autres Manifestations Tuberculeuses par l'Héliothérapie." He briefly referred to the former communication, which was based upon the results of treatment in 11 cases of lupus vulgaris and 34 cases of scrofuloderma. Of the 11 cases of lupus eight had been cured—i.e., almost 73 per cent. Of the 34 cases of scrofuloderma 28 had been cured—i.e., 82 per cent. The patients had been exposed so that the solar rays fell as directly as possible upon the lesions for a period of two or three hours daily, increasing to seven or eight hours daily according to the degree of reaction of the tissues exposed. To avoid cerebral congestion a broad-brimmed ives £55 and horse allowance of £42. The assistant eon is also public vaccinator, police surgeon, for which 3 paid £45, and port surgeon, for which he receives £109.

Helena.—The colonial surgeon receives £300 per im and £30 horse allowance: Private practice is wed.

alkland Islands.—There are two appointments, one of ch is paid at the rate of £300 per annum, with £25 as th officer, and the other at the rate of £200 per annum. ate practice is allowed in both cases.

yprus.—There is a chief medical officer paid at the rate 500 per annum, two district medical officers paid at the of £250 per annum, and one paid at the rate of £200, ng by £10 a year to £250, all enjoying private practice receiving 2*s.* per diem forage allowance. These are the medical appointments in the island which are open to lish candidates and they are made by the Foreign Office. ll applicants for medical employment in these 18 colonies t be between the ages of 23 and 30 years, and must be lified for registration. Preference will be given to e who have held appointments as house physicians house surgeons; certificates of moral character and of iety will be required, and every officer before being ointed will be medically examined by one of the consult- physicians of the Colonial Office. There are pension ds established for widows and orphans in Ceylon, Straits lements, the Federated Malay States, Hong-Kong, and uritius, to which all permanent Government servants st subscribe 4 per cent. of their salaries.

The West African Medical Staff.—All the medical officers the service are selected by the Secretary of State for the onies. They are engaged in the first instance for one r on probation and, except the principal medical officers, allowed to engage in private practice as long as it does interfere with the efficient discharge of their official ies. There are fair allowances when junior officers dis- rge the work of their seniors by deputy. Stores are nsported free, out-of-pocket expenses in travelling are overable, there are proper horse, field, and outfit allow- ces, and all medical men are paid 10*s.* per diem extra th free rations, or 3*s.* in lieu of rations, while serving on litary expeditions. Candidates for the West African dical Service must be British subjects of European parent- e, preferably unmarried and between the ages of 25 and years. They may choose their colony or protectorate, and far as possible their wishes will be met, but they must ke up their minds carefully as transfers are seldom made. The grades and salaries of medical officers are shown in e following table:—

Grades.	Gold Coast, Southern Nigeria, Northern Nigeria.			Sierra Leone, Lagos.			Gambia.		
	Minimum salary.	Annual increment.	Maximum salary.	Minimum salary.	Annual increment.	Maximum salary.	Minimum salary.	Annual increment.	Maximum salary.
	£	£	£	£	£	£	£	£	£
incipal medical officer*	1000	50	1200	800	50	1000	—	—	—
eputy *principal* medical officer ...	700	25	800	—	—	—	—	—	—
enior medical officer	600	20	700	600	20	700	500	20	700
ledical officers ...	400	20	500	400	20	500	400	20	500

* In the Gold Coast the salary of the principal medical officer is 1000, with duty pay at the rate of £200 a year.

Every candidate selected for appointment will, unless the Secretary of State decides otherwise, be required to undergo a course of instruction for two or three months at the London School of Tropical Medicine or at the Liverpool School of Tropical Medicine. If for any reason he does not undergo the course before appointment he will be required to take out instruction on less favourable pecuniary terms during his first leave of absence. The cost of the tuition, fees, board, and residence during such instruction, amounting to a maximum of £48 8*s.* 10*d.* for three months, will be borne by the Government, and a daily allowance of 5*s.* will be paid to each candidate during the course and may be continued subsequently up to the date of embarkation. These payments will be made subject to the candidate signing an agreement by which he will be bound to refund them (1) if he declines to accept an appointment in any of the colonies or protectorates for which he may be selected; (2) if he fails to obtain the certificate referred to in the next paragraph; or (3) if he relinquishes the West African service for any other reason than mental or physical infirmity or is removed for misconduct within three years of the date of his arrival in West Africa. Every candidate sent to either of the schools of tropical medicine is required to obtain a certificate showing that he has satisfied the school authorities with regard to his regularity of attendance, progress, and proficiency.

The arrangements for special allowances and leave of absence are fair. The ordinary term of residential service is one year, followed by leave with full pay during the voyages to and from England and for four or two months clear in England, according as the officer is returning for further service in West Africa or not. If an officer is detained beyond the year additional leave is given with full pay for ten days in respect of each completed month beyond 12, whether he is returning or not. If he is invalided before the end of the year the leave with full pay is for the voyages and for ten or five days in respect of each completed month, according as he is returning or not. Leave granted on the understanding that an officer will return is known as "return leave" and any pay drawn in respect of such leave is liable to be refunded if an officer does not return. Leave may be extended for a limited period with half or no pay on the ground of ill health or without pay on other grounds. Free passages are given to all officers who are granted leave and on first appointment. On attaining the age of 50 years, or after 18 years' service (of which at least 12 must have been residential), an officer is qualified for a pension calculated at one-fortieth of the last annual salary for each year of service. If invalided after a minimum of seven years' service he is qualified for a pension calculated at the same rate. If invalided before completing seven years' service he is qualified for a gratuity not exceeding three-fourths of a month's salary for each six months of service, provided that he has been confirmed in his appointment and that he is specially recommended by the governor or high commissioner for such gratuity. At the end of nine years (of which not less than six must have been residential) an officer of the West African Medical Staff is permitted to retire with a gratuity of £1000, or at the end of 12 years (of which not less than eight must have been residential) with a gratuity of £1250, such gratuities being *in lieu of* pension.

Births, Marriages, and Deaths.

BIRTHS.

TEASDALE.—At Carolgate House, Retford, Notts, on August 25th, the wife of J. C. Teasdale, M.B., M.R.C.S., of a daughter.

DEATHS.

CLAGUE.—On August 23rd, at Crofton, Castletown, Isle of Man, John Clague, M.R.C.S., L.R.C.P. London, L.S.A., aged 65 years.

HENDERSON.—At Warrnambool, Australia, on May 23rd, Lucy, wife of John H. Henderson, M.B., F.R.C.S., in her 33rd year.

HUGHES.—On August 25th, at Roe Street House, Macclesfield, James Brierley Hughes, Surgeon, aged 65 years.

THE INTERNATIONAL CONGRESS ON TUBERCULOSIS.—According to the latest advices received from Washington the members of the Congress are to be entertained at Philadelphia on Sept. 24th and 25th. From Sept. 28th to Oct. 3rd the Congress, it was at first understood, would sit at Washington and there were to be but few if any entertainments to break upon and to disturb the more serious work. But the last letter received from headquarters nevertheless speaks of some entertainment in Washington. In any case, during the week following, the receptions are elsewhere, namely, at Baltimore on Oct. 5th, at Boston on the 6th and 7th, and in New York on the 8th and 9th. After that there will be excursions to the sanatoriums of Liberty and Saranac which are in the north of the State of New York.

Sabouraud pastille, thus indicating a difference from an x ray tube. He considered that they were yet without a satisfactory explanation of the way in which radium produced its effects on living tissues. It resembled the action of the x rays in some ways but not in all.

Dr. LEWIS JONES had found good results from the use of radium but had recently given it up when treating rodent ulcer in favour of zinc ions. A disadvantage of radium was that it lost its power gradually.

Dr. DAWSON TURNER showed lantern slides of a case of rodent ulcer which had been completely cured by the x rays.

The PRESIDENT of the section said that while no doubt good results could be obtained in the treatment of birth-marks by radium, he felt that the risk of substituting a troublesome and unsightly telangiectasis for the birth-mark was one that militated very strongly against its use. His own experience in the treatment of nævi was a very large one, amounting to probably not less than 300 cases yearly, and he had yet to find a case in which a satisfactory result could not be obtained by electrolysis, puncture with a fine cautery, or the high-frequency spark, sometimes spoken of as "fulguration," the last being particularly suitable for that class of case known as "port-wine stain."

Mr. DEANE BUTCHER, in his reply, stated that there was no risk of the radium falling off in its power if proper precautions were taken to protect it from moisture. While glass was the best material it was inadmissible because it cut off the greater part of the rays which it was desired to make use of. His own specimen was contained in a platinum capsule with a cover of talc; so secured as to prevent moisture getting into the radium. As a further precaution he used a fresh wrapping of gutta-percha tissue for each case, this material having practically no obstructive action on the therapeutically active rays.

Dr. HARRIS read a paper on

The Diagnosis and Electrical Treatment of Nerve Injuries of the Upper Extremity.

It was based on 27 cases of injury to the shoulder selected from the out-patients attending the electrical department, now the department for nervous diseases, at St. Mary's Hospital. Of these 27 cases 16 had been dislocations of the shoulder, and in each case there had been paralysis of the deltoid and infraspinatus muscles, in many of the severer cases accompanied by anæsthesia over the outside of the shoulder and upper arm. These were not cases of partial Erb's paralysis, as was shown by the presence of the anæsthesia, but must be separate lesions of the circumflex and suprascapular nerves. The circumflex was no doubt damaged by the downward displacement of the head of the humerus dragging on the inferior muscular branch of the circumflex, which wound round the humerus, thus causing a paralysis of the deltoid, and in the more severe cases the cutaneous portion of the nerve was also damaged, causing anæsthesia. The infraspinatus muscle probably suffered in the following way: the downward displacement of the head of the bone carried the attachment of the infraspinatus into the great tuberosity downwards and forwards, thus dragging on the suprascapular nerve as it wound round under the acromion to pierce the under surface of the muscle. Usually in these cases the infraspinatus suffered more than the supraspinatus, but until wasting set in paralysis of the latter muscle was difficult to detect. In seven of the 16 cases the musculo-spiral nerve had been also damaged by traumatic neuritis, causing dropped wrist from paralysis of the extensors. In only one of these was the posterior cord damaged as a whole, in the remaining six cases the escape of the latissimus being evidence that the musculo-spiral nerve was damaged beyond the point of exit of the subscapulars, though at first sight the combined paralysis of the deltoid, triceps, supinator longus, and extensors in the forearm might suggest a lesion of the posterior cord. The musculo-cutaneous nerve suffered in six of the 16 cases, as shown by paralysis and wasting of the biceps, whereas the ulnar nerve suffered in only three cases and the median nerve in only two. One of the cases was so severe that every muscle supplied by the circumflex, suprascapular, musculo-cutaneous, musculo-spiral, median, and ulnar nerves was completely paralysed, with reaction of degeneration on electrical testing. That this was not a lesion of the primary nerves of the plexus was shown by the escape of the latissimus and pectoral muscles. Other evidences of severe neuritis in these cases would be pain, œdema of the hand, wasting of the finger pads, peeling of the thick skin on the palm, glossy skin, and later periarticular adhesions of the interphalangeal joints. This was a most serious disability and might cripple the hand permanently, long after the muscles originally paralysed had fully recovered. This complication must be treated early and continuously by passive movements of the finger-joints. The electrical treatment of the paralysed muscles was best arranged for by tying on flexible copper ring electrodes over the shoulder and arm and connected by wires to a galvanic battery through a Pohl's commutator worked by a metronome set to beat twice per second, the muscles being thus treated by reversals of a galvanic current of about six milliampères. Although dislocations of the shoulder from falling upon the outstretched arm thus were liable to produce lesions of the nerves to the upper extremity after their exit from the plexus, quite a different form of paralysis was liable to occur from falls upon the point of the shoulder. This accident was liable to cause a traumatic neuritis or even rupture of the fifth cervical nerve, the highest and most oblique of the primary nerves forming the brachial plexus. Damage to this nerve caused paralysis of the deltoid, supra- and infra-spinatus, biceps and brachialis anticus, supinator longus, the two radial extensors of the wrist, and the pronator radii teres, without any trace of anæsthesia. Five cases of this injury were described, one being due to prolonged pressure upon the arm in a painter lying prone upon the left arm for six hours painting a tombstone. In more severe injuries to the shoulder the sixth nerve as well as the fifth might suffer, causing weakness of the pectoral, triceps, and latissimus in addition, two cases of such injury being described resulting from severe crushes of the shoulder.

Dr. LEWIS JONES complimented Dr. Harris on his excellent paper and said that so far as he himself was concerned the paper required to be studied carefully before attempting to discuss it seriously.

The PRESIDENT of the section also concurred in what had been said by Dr. Lewis Jones and desired to ask Dr. Harris what his experience was in the treatment of ischæmic myositis coming on after tight bandaging, especially after fracture near the elbow-joint.

Dr. HARRIS, in reply, said that he relied mainly upon massage properly carried out to bring about an improvement in the affected muscles, though electrical treatment was of considerable value.

FRIDAY, JULY 31ST.

This day's proceedings were opened by Mr. C. THURSTAN HOLLAND (Liverpool) who read a paper to open a discussion on

The Uses of Bismuth in the Diagnosis of Conditions of the Œsophagus and Stomach.

The method employed by him was to give a dose of two ounces of carbonate of bismuth in mucilage, after having got ready to watch its progress into the stomach, the patient standing in an oblique position so as to allow the passage of the bismuth down the gullet to be seen clear of the shadow of the vertebræ. Full precautions were, of course, taken to protect the operator from the rays and the screen was so arranged that tracings could be taken of the shadows and necessary landmarks. Any obstruction to the free passage of the bismuth down the œsophagus was easily seen and noted, also diverticula, &c. The bismuth having reached the stomach, the patient was first examined standing in the antero-posterior position and afterwards lying down. The alteration in the shape of the stomach shadow, as also its position between standing and reclining, was very remarkable. The paper was illustrated with a large number of tracings made in this way and also a number of radiographs. These were made not only at the time of taking the bismuth but also at intervals afterwards when it was desired to get some idea of the muscular efficiency of the gastric walls. The diagrams, &c., formed an essential feature of the paper, for a study of them showed that a surprising amount of information regarding the digestive tract can be obtained by this method. Indeed, by giving a bismuth meal it was possible to map out all the essential parts of the digestive tube by a series of radiographs taken at intervals. A curious fact was that these massive doses of bismuth seemed to have

Various writers have marked the prevalence of summer diarrhœa with a high ground air temperature; with this I agree, particularly when occasional showers alternate with prolonged high atmospheric temperature. We know that micro-organisms flourish best at the body temperature; this temperature is most nearly approached in both the ground air and atmosphere when infantile diarrhœa is most prevalent in any country. Moreover, micro-organisms want a certain amount of moisture present to flourish best as then they get a better nutritive medium. Now when we have occasional showers and a maintained high atmospheric temperature, and also high ground-air temperature, we have an ideal medium for micro-organismal growth. To my mind the organism of epidemic infantile diarrhœa is one which flourishes in such circumstances. Furthermore, investigation has shown that the fly requires neither too much nor too little moisture when depositing her eggs and that the sites she usually chooses are heaps of decaying vegetable matter or dung, which it is also well known are swarming hotbeds of micro-organismal life. I have pointed out that during the act of oviposition she remains motionless for seven and a half minutes. My theory is that whilst walking over the nauseous material in which she lays her eggs and during her act of oviposition multitudes of micro-organisms—and pre-eminent amongst them the *unknown one* of infantile summer diarrhœa, which seems to me to belong to the group of staphylococci in all probability—*adhere to the moist sucker-like terminations* of the hairs on the pulvilli of the fly's legs. Of course, any house fly, male or female, in its travels may pick up the organism as both sexes haunt masses of decaying vegetable and organic matter, but it is evidently the female that acts as the chief carrier.

The house fly loves warmth, and also the delicacies of our tables, so that we find it in abundance in our homes, frequenting the sugar bowl, the jam pot, and often falling into the milk jug. In this way it carries the contagion, which is left behind in our food, and when the fly falls into the milk the infective agent is washed off it and, unseen by us, floats in the milk. Babies often sleep with their mouths open and frequently also with milky saliva moistening their lips. As I mentioned previously, the fly seems to be attracted to an infant's mouth, and often will venture slightly inside it, the poison being washed off the insect's legs and infecting the child, which contracts summer diarrhœa even if breast fed. Of course, breast-fed cases of the disease are rarer than when the child is artificially fed, as it is not every infant who sleeps with open mouth. Moreover, the artificially fed child is constantly open to additional infection by virtue of its milk-supply, as also the sugar used to sweeten it. Usually the milk for the child is prepared twice daily and left uncovered either in the larder in better class houses, or amongst the poorer classes in the kitchen, so that the flies drop into it, and as the fly is removed and the milk not re-boiled but simply warmed before giving to the baby, the micro-organism remains alive, and later baby contracts the diarrhœa, especially among the poorer classes.

II.—*Methods of Prevention.*

The question now arises, How may epidemic infantile diarrhœa be prevented? During the years 1904, 1905, and 1906 I recommended patients of mine to keep a fine meshed muslin cover over the infant's face when sleeping. The milk should be prepared, diluted with water, barley water or lime water, and the requisite cream and sugar added, then boiled. In should then be placed in a vessel which is covered with a muslin cover and kept in a cool, well-ventilated place, for example, a safe or larder. A suitable covering is easily manufactured by twisting a piece of wire into a ring shape and sewing a muslin cover to it. The muslin should be renewed frequently. The milk should be prepared thus twice daily and a fresh supply used each time. All vessels used in preparing the milk should be scrupulously clean and scalded before use. The bottle used should be of the Lamb feeder type and should be cleaned after use, and then half a teaspoonful of boric acid should be placed in it, and the bottle filled up with hot water. The teat should be scrubbed and kept in a weak boric acid solution. Before again using both bottle and teat should be washed in warm water. I can safely say that where the above procedure has been adopted—and the cases are numerous—I have not known a case of epidemic infantile diarrhœa to occur. All vegetable and animal refuse from the house, such as cabbage leaves, peelings, tea leaves, &c., should be burnt. No open ash should be allowed, but galvanised iron dust bins with a well fitting lid should be insisted upon, and vegetable and animal refuse should be rigidily excluded from these. The bins should be emptied twice weekly. The dung from stables and shippons which are near dwelling houses ought to be frequently removed, and not allowed to accumulate as is usually the case. People should be instructed to keep their eatables in a safe outside the house, and such should be a necessary adjunct of every house, and should have a fine perforated metal door. Fly papers, of the sticky variety, should be at once used when flies appear, and if the pest gets numerous a little turpentine should be poured over some dying cinders on a shovel occasionally. I do not advise the wholesale extermination of the fly, for it has its place in nature. In fact, it is indispensable to our health and comfort, for if you turn over the body of some recently killed creature in the fields you will observe its frame is a seething mass of maggots. Thousands of these are the larvæ of the house fly. Returning in a few days you will find that they have devoured all the carcass save a little skin and the bones, the latter sinking into the ground and forming a valuable manure. So we see that the fly thus prevents decaying animal and vegetable matter decomposing into poisonous and ill-smelling compounds, which would breed pestilence. In turn, the larvæ, having developed into the fly, are preyed upon by birds, frogs, &c., which in turn are preyed upon by man and other animals, or are converted into constituents of the soil.

By the measures which I have recommended the occurrence of epidemic infantile diarrhœa can be effectually prevented. In large towns where there is already a system of depôts where sterilised milk can be obtained it would only be necessary to go a step further and to print a leaflet of instructions and to provide the gauze articles at a low cost. Sanitary authorities could supervise the contents of the galvanised bins, &c.

Liverpool.

AN UNUSUAL CASE OF CHRONIC BI-NITROBENZENE POISONING.

By EDWARD WALKER, M.D. EDIN.,
HONORARY PHYSICIAN TO THE HUDDERSFIELD INFIRMARY.

A YOUTH, aged 16 years, was admitted into the Huddersfield Infirmary on the evening of May 25th, 1907. In appearance he was pale and bluish, though the blueness did not amount to cyanosis. He was very weak and prostrate. His skin was a dirty yellow and his conjunctivæ were also yellow. He was restless and short of breath, rambling, excited, and sleepless. The temperature was normal: the pulse was 80, feeble, and of low tension. The tongue was dry and coated, the palate was yellowish, and the gums were blue. There was marked tenderness over the liver, stomach, and spleen. There was bilious vomiting and the bowels were constipated. The urine was dark brown in colour but clear and of specific gravity 1022. No bile was present. He was not in a condition to give an account of himself or to detail any history of his illness; but the condition of the urine, the colour of the lips and palate, the peculiar yellowness of the skin and conjunctivæ, the yellow pigmentation on the hands (so constantly found in workers amongst bi-nitro compounds), together with the tenderness over the liver, spleen, and stomach led us to make the diagnosis of chronic bi-nitrobenzene poisoning. We subsequently learnt that he had been working at some neighbouring chemical works amongst bi-nitro compounds from the previous January to April and that during that time he had on two occasions—once in February and once in March—suffered from slight attacks of acute bi-nitrobenzene poisoning; also that on each occasion he had been off work for two days. On April 29th he had another attack of a somewhat more severe character. He felt ill and weak, was dizzy, and had a staggering gait. He was breathless and his face was pale, and his lips and fingers were blue. He at this time left his employment because of his condition, but in a week's time was well enough to take some light open-air work. He, suggestive of ingravescent cerebral or cerebellar abscess. In conclusion, Dr. Whitehead emphasised the importance in general practice of making an earlier, if less exact, diagnosis in the cases which they had under discussion. Persistent headache, with otorrhœa and no other causative factor, should put the practitioner on his guard against intracranial complications of middle-ear suppuration, and finally, it was important to bear in mind that the most dangerous cases might occur without there being signs or symptoms over the mastoid region.

Dr. W. S. SYME (Glasgow) cited a case in which the intracranial symptoms were attributed to puerperal conditions, whilst really they were due to otitis. This was confirmed three years later when at an operation the lateral sinus was found to be reduced to a thick cord.

Dr. STCLAIR THOMSON (London) pointed out the possibility of nasal complications having to be considered in making a diagnosis. The intracranial complications might be secondary to sphenoidal sinus disease. In washing out the sphenoidal sinus pain was not uncommonly referred to the occiput or the ear on the same side.

Mr. F. HUNTER TOD (London) was opposed to delay. Given a case in which the ear was affected and there was a rigor, then he was in favour of exposing the lateral sinus. He cited cases in which malignant endocarditis was confused with mastoid disease in the diagnosis, and also a case in which furunculosis alone was associated with malignant endocarditis. Uræmia might also confuse the diagnosis.

Mr. W. STUART-LOW (London) was in favour of repeating the lumbar puncture for diagnostic purposes.

Dr. J. STODDART BARR (Glasgow) urged a routine examination of the eyes, as optic neuritis afforded valuable information in several cases.

Dr. A. LOGAN TURNER (Edinburgh) discussed the signs of cerebellar abscess.

Dr. A. BRONNER (Bradford) was in favour of tying the jugular vein if rigors persisted, although the lateral sinus might be normal. He considered that intracranial complications were less frequent than eight or ten years ago, and this he attributed to improved methods of treatment of ear disease by practitioners.

Mr. T. G. OUSTON (Newcastle-on-Tyne) cited a case in which lumbar puncture had been a failure; post mortem the failure was found to be due to the sheaths of the canal being cut off and blocked with old tuberculous disease.

Dr. ANDREW WYLIE (London), Dr. J. WALKER DOWNIE (Glasgow), and Dr. G. WILLIAM HILL (London) also took part in the discussion.

The PRESIDENT of the section, in briefly summing up the debate, pointed out that the exploration of the brain through a septic focus was a serious matter in view of the lack of resisting power of the brain to septic material. He thought that there might be a tendency for practitioners to be led away by published results and to adopt exploratory operations too readily.

Mr. BALLANCE, in reply, agreed that the negative exploration of the brain was a calamity. In cases of possible labyrinthine complication he advised following the disease through from the mastoid operation. Optic neuritis was due to basal meningitis, although perhaps it might only be microscopic in extent. It was therefore an intracranial complication and the case should not be watched but treated.

Dr. WHITEHEAD also replied.

Mr. A. R. TWEEDIE (Nottingham) read a paper entitled "Investigations on 'Deaf Mutes' as to 'Labyrinthine' Nystagmus."

Dr. P. WATSON WILLIAMS (Bristol) gave a demonstration of an Osteoplastic Operation for Accessory Sinus Disease.

Dr. STODDART BARR read a paper entitled

Remarks on Paralysis of the Sixth Cranial Nerve, consequent upon Chronic Purulent Middle-ear Disease, with Reports of Two Cases.

The first case was that of a lad, aged 17 years, who had suffered from purulent discharge from the right ear for 16 months. Headache, vomiting, and slight shivering supervened a fortnight before admission to hospital, while double vision with squinting of the right eye had existed for five days. Double optic neuritis was found in addition to paralysis of the right sixth cranial nerve. The mastoid antrum which was diseased was opened, the sigmoid sinus exposed, and a small perisinus abscess evacuated. The walls of the sinus were covered with granulation tissue. No other pathological changes were found. The paralysis of the sixth nerve passed off in three months and the optic neuritis in six months, leaving normal vision. The mastoid cavity was epidermised in four months. The second case was that of a boy, aged 13 years, who had purulent discharges from the left ear from babyhood. Treatment had been prescribed but had been neglected. Urgent symptoms, consisting of pain in and behind the left ear, swelling and tenderness over the mastoid, vomiting, and bleeding from the nose, commenced four weeks before admission to the hospital, and left facial paralysis with double vision and squinting of the left eye supervened a week later. Double optic neuritis was found present on admission. The radical mastoid operation was performed, revealing here also a perisinus abscess. The walls of the sinus were thickly covered with granulation tissue. The facial paralysis rapidly subsided, but four months elapsed before the function of the sixth nerve had quite recovered, while eight months elapsed before the optic neuritis had completely passed off, leaving, however, normal vision. The operation cavity was dry four months after the operation. The mode of involvement of the sixth cranial nerve in such cases and its frequency and significance were discussed, special reference being made to the valuable work done in connexion with this subject by Professor Gradenigo. Specimens having anatomical and pathological bearing upon the subject were shown.

The paper was discussed by Dr. WATSON WILLIAMS, and Dr. JOBSON HORNE, in thanking Mr. Ouston for it, said that its value had been considerably enhanced by the exhibition of the specimens which supplied the concrete evidence.

Mr. OUSTON read a paper entitled

"A New Operation for Depressed Fractures of the Nose."

After a few introductory remarks upon fractures of the nasal septum and dislocation of the lateral nasal cartilages, Mr. Ouston went on to state that if external deformity resulted from the injury the child was brought for surgical advice and one of the following opinions was probably given: (1) that the child would grow out of it; (2) that nothing could be done; (3) that the surgeon would try to rectify the condition by an operation but that success was very doubtful; or (4) that after the child had attained full growth the deformity could be corrected by the injection of paraffin. Time would show the fallacy of the first opinion. The second was eminently unsatisfactory, albeit honest in intent. The third had been given four times in four cases by Mr. Ouston; the first two results were failures, the third, however, was a success. The method by which this success was obtained was as follows. The patient, a girl, ten years old, had fallen on to her nose a few weeks previously. The upper lateral cartilages were displaced backwards from the nasal bones and separated posteriorly from their attachments to the nasal processes of the superior maxillæ. The lower end of the nasal bones projected with a depression below them where the triangular cartilage was markedly indented. The general appearance was that of a flattened nose with a sharper indentation at the lower trisection of the nasal crest. At the operation a tenotome was introduced subcutaneously through the side of the nose at the site of the depressed nasal cartilage dividing the structures uniting them posteriorly with the nasal bones and nasal processes of the maxillæ. The knife was also carried through the septal cartilage at the level of the posterior border of the lateral cartilages, and this structure with its adherent mucous membrane divided to an extent corresponding to the length of these cartilages. The separation was continued until the whole structure of the nose corresponding to the depressed portion could be easily lifted by the tenotome (transfixing the nose) to the normal level. The nasal bones were then transfixed by a large strong needle as near their common anterior sutures as possible, this being easily effected by means of sharp taps from a metal mallet. The structures of the nose were then transfixed by a second needle at a site beneath the depression and on a plane distinctly posterior to that of the first needle. Strips of gauze were then wound round the two needles on each side respectively in a figure of 8 manner. The upper needle firmly imbedded in the nasal bone acted as a fixed point, and on after which the rhonchus was loudest on the left side, though it was audible on the right. On the 2nd the condition was the same as it had been the previous night, except that he looked more drawn. He now consented to the performance of an operation.

A low tracheotomy under eucaine and adrenalin was done; while waiting after the injection I examined his larynx with the laryngoscope as he thought there was something there, but it was normal. His head was brought over the edge of the table and supported in an over-extended position. Dr. H. A. Engelbach retracted by means of a suture on each side passed through the end of the centre of the cut cartilages. After cocainising the trachea I was able to pass a Kelly's male cystoscope easily and with a forehead light examined the trachea and bifurcation of the bronchi; the right bronchus was readily entered and nothing was found. The left bronchus was also readily entered by pushing the lower end of the trachea to the left with the lower end of the tube, and so the mouth of the left bronchus was exposed. At the lower end of the left bronchus a large plug of mucus was seen. There was some difficulty in wiping this away and coughing also caused much waste of time. When I at length got the mucus away the gum was clearly seen in the lower division of the left bronchus, the entrance of which it appeared to fill. At this stage in manipulating a swab I succeeded in breaking my only useful forceps—a urethral crocodile forceps. I tried to get a wire with a small hook at the end past the gum but there was no space. So Dr. Engelbach and I adjourned while we sent to Messrs. Mayer and Meltzer for another forceps; the man wanted to get it done. When the forceps came I again cocainised the trachea and bronchus and was soon able to get hold of the gum, but after pulling it up an inch it gave and I found a small piece only in the forceps. Now, however, the gum was in the main bronchus and I was able to pass my hooked wire past it as there was a space between it and the wall of the bronchus. I dragged it up to the speculum, and as it was too large to come through this, withdrew the speculum, the wire, and the gum together. A search in both bronchi showed no other piece. I sewed up the trachea with catgut and left part of the superficial wound open. The man had borne the operation well; he had been on the table three hours, a good deal of this time being spent in waiting. Recovery was uneventful. The piece recovered weighed about 9½ grains.

The principle upon which I acted was that of the bronchoscope. As soon as the case came to me I endeavoured to get a bronchoscope but was unable to do so. Messrs. Mayer and Meltzer have since made one for me, but I could not wait for it; and in any case the lower bronchoscopy which I employed would seem to be safer and easier except in very expert hands. The Kelly's cystoscope tube did very well as a speculum and was just long enough to reach the gum, which was 6½ inches from the tracheotomy opening. The urethral forceps was very convenient. The wire was the stylet of a silver catheter and was fairly rigid; I had bent a small hook on the end. It was surprising to find how clearly one could see the trachea, the bifurcation of the trachea, and the bronchi, with their divisions. From the physical signs we judged the body to be in the right bronchus at first, but we thought that it had been coughed up and had fallen into the left bronchus on the day before the operation.

Cape Town.

AN OUTBREAK OF COW-POX.

BY ALAN B. GREEN, M.A., M.D., B.C. CANTAB.,
BACTERIOLOGIST-IN-CHARGE, CALF VACCINE DEPARTMENT, LISTER INSTITUTE OF PREVENTIVE MEDICINE.

THE following is of interest inasmuch as it is a record of a somewhat unusual occurrence—namely, an outbreak of cow-pox in a herd of milch cows. The herd is the property of a farmer in Hertfordshire.

During the middle of March of the present year it was noticed that the teats of several of this herd of cows were cracked or "chapped." This was attributed by the farmer to the east winds which were prevalent at the time, and no importance was attached to it as similar lesions are not infrequent among cows in the early spring. About two weeks after these cracks appeared definite sore places began to develop on the same areas. 25 out of a herd of 27 cows were affected in this way. On April 6th the farmer, a man of about 50 years of age, noticed sore places on both his hands. Both hands became severely inflamed, in consequence of which he consulted Dr. Daniel Wilson of Bushey Heath. The right hand was more affected than the left. Dr. Wilson found papular areas on the fingers and palmar and dorsal surface of the right hand, and one or two papules on the left hand, accompanied by extensive œdema of the surrounding subcutaneous tissues and redness of the neighbouring skin. The axillary glands were also enlarged. A day or two later one or two similar papules developed on the patient's forehead and one on the upper lip accompanied by local swelling and redness and considerable constitutional disturbance. Three or four days later all the papules developed a vesicular stage, the vesicles showing umbilication and presenting the appearance of vaccine vesicles of a severe type. A clear fluid resembling the discharge of vaccine vesicles exuded from the vesicles, and their subsequent course was identical with that of vaccinal lesions of a severe and prolonged attack of generalised vaccinia. The farmer himself had milked the cows and washed their udders. He had not been vaccinated in the ordinary way since childhood.

On April 16th the farmer's son, aged 26 years, who had attended to the cows affected with sore teats and had washed their udders, noticed that both his hands were uncomfortable and on the 17th and 18th papules developed on the palmar and dorsal surfaces, the right hand being considerably more affected than the left. The papules were accompanied by severe local œdema and redness of the surrounding skin. Lymphangitis was set up in the right arm and considerable enlargement of the axillary lymphatic glands, while the temperature of the patient rose to 104° F. on two evenings. The papules became vesicular, showing the distinctive appearance of the vesicles in a case of generalised vaccinia, and their subsequent course was typical of that condition. The patient had not been vaccinated since infancy. On May 17th he allowed me to vaccinate him on his left arm. No vesicle or even papule resulted. The vaccine used was the calf vaccine series which was being issued at the time from these laboratories for human vaccination. The results obtained by medical men with this series are shown by the schedules which have come to hand to be: case success 100 per cent. and insertion success 99·7 per cent. No failures have been reported on any schedule. It may be assumed therefore that the patient on the 17th was immune to vaccination.

On May 1st a farm labourer, aged 39 years, who had been engaged in milking the cows, developed two papules on his right hand. This case followed the same course as the two preceding cases, except that the disease was very much milder. This man had not been previously vaccinated since infancy.

On May 8th another farm labourer, aged 32 years, developed a papule on his right hand. His case was parallel with the one last mentioned. He had not been vaccinated since infancy.

It has been ascertained lately that while the farmer and his son were ill three other cow-milkers said that they had sore fingers on the right hand. Apparently no vesicular stage occurred in these cases, but as their hands were not examined at the time little or no value can be attached to their condition. All the foregoing persons are right-handed.

Only one milker, an old man, says that he has had nothing the matter with his hands.

Bacteriology.—Aerobic and anaerobic cultivations showed the presence of staphylococcus aureus and albus only in the pathological material available—namely, the exudate from the vesicles of the farmer's son's hand. These micro-organisms, as is well-known, are those generally obtained from the vaccine lymph of humans and of animals.

Animal experiments.—For these also the only available pathological material was fluid exudate from the vesicles of the farmer's son's hand. Two guinea-pigs inoculated with this fluid developed typical vaccine vesicles three and four days later at the site of inoculation. Two weeks later these guinea-pigs were inoculated with highly potent calf vaccine and no specific reaction was noticed as a result. A calf inoculated with the fluid from the farmer's son's hand developed typical vaccine vesicles. It was not practicable to vaccinate this animal subsequently with calf vaccine. The vesicles which found in a normal antrum, and one had to discriminate between a pathogenic and a non-pathogenic rôle. He was opposed to packing the antrum after the first 24 hours following the radical operation.

The PRESIDENT of the section summed up the discussion and the openers replied.

Dr. STCLAIR THOMSON agreed that the antrum was dark to transillumination at times after a cure had been effected. The wound in the canine fossa made in the radical operation required no stitches; the parts falling naturally into apposition it closed up of itself.

Dr. LOGAN TURNER was also of the opinion that the lines of treatment should be put upon a scientific basis, and he was not in favour of opening an antrum for the purposes of diagnosis. He also had found that the chronic cases continued to be opaque to transillumination after treatment and when there ceased to be evidence of discharge

Mr. CHARLES A. PARKER (London) read a paper on

Accessory Air Cells in the Septum Nasi, an Unusual Development of the Sphenoidal Sinuses.

He exhibited some skulls and diagrams demonstrating the presence of the cells referred to in the paper.

Dr. WALKER DOWNIE read a paper entitled

"On the Permanence of the Improvement in the Shape of the Nose obtained by the Subcutaneous Injection of Molten Paraffin, based on an experience of over Two Hundred Cases."

Two questions were considered: (1) Was the paraffin after being injected into the nose affected in any way by the external temperature? and (2) Was the result obtained from its introduction permanent? In regard to the first question, Dr. Downie's experience went to prove that climate exercised no effect whatever on the paraffin lying in the subcutaneous tissues, nor did exposure to a high temperature, such as was necessary in the pursuit of certain occupations, affect it in any way. In regard to the second question, he held that if paraffin having a melting-point of from 108° to 110° F. were used, if it were injected in the molten state, and if the necessary precautions were taken to prevent it spreading beyond the depressed area, the paraffin did not subsequently "wander" and it did not become absorbed, but that it remained permanently in the position which it occupied when it became solidified in the tissue.

Dr. JAMES ADAM (Hamilton) read a paper entitled

"Remarks on the Pathology and Treatment of Atrophic Rhinitis"

The paper was based upon the work of the last two years and was limited to 29 cases because on these alone Dr. Adam had had the chance of making a thorough examination. In his introductory remarks he acknowledged his indebtedness for much laborious and careful histological work to Dr. John Anderson, the pathologist to the Victoria Infirmary, Glasgow; for bacteriological observations to Dr. R. M. Buchanan, city bacteriologist, Glasgow; for preparing vaccines from Abel's bacillus to Dr. Ian Struthers Stewart of Edinburgh; and for treating two cases with x rays to Dr. William Allen of Glasgow. Dr. Adam had arrived at the following conclusions: 1. There were two types of atrophic rhinitis, that with and that without sinusitis; they might be the same diseases histologically but clinically and for treatment they were not. In treatment until the rhinologist had found sinusitis he ought to be always ready to revise his diagnosis, and where the pharyngeal condition predominated to suspect sphenoid disease. 2. Atrophic rhinitis was the end stage of a purulent hyperplastic rhinitis, involving first the membrane, then in more than half the cases the sinuses; they by a vicious circle reacted on the membrane. 3. This purulent rhinitis resulted from microbic action and was most likely to occur in persons who were more than usually liable to mucous inflammation or who had structural peculiarities of their sinuses. Crusting and fœtor were favoured by width of nostril and by the presence of Abel's bacillus, the toxins from which might also accelerate atrophy, but fœtor was not a necessary accompaniment, and therefore "ozæna," the name of the symptom, ought to be abandoned as the name of a disease and Gottstein's definition shortened to rhinitis atrophicans. The treatment of the condition was its treatment in the hyperplastic stage All purulent rhinitis in children, especially a sequela of eruptic fevers, ought to be persistently dealt with. Every case of purulent rhinitis ought to be regarded as one of sinusitis till the contrary was proved. The folly of paraffin injection before diseased tissues had been treated was obvious. Mentioning the benefits to be got from cleansing, packing, and the use of the sucker, as also the improvement often got after the treatment of sinusitis, he referred to the following three points. 1. Paraffin injections gave good results when there was no sinusitis, when the membrane was not too thin to hold the paraffin; they should be preceded by massage to strengthen and stimulate the membrane; should be done with solid rather than with liquid paraffin, though he had known both cause thrombosis, and though solid paraffin often came out as fast as injected. By slowing evaporation and preventing crusting it sometimes got rid of the need for douching; by helping to obliterate the glands it aided nature's method of cure He had had fair or good results in only four cases, for he had been experimenting lately with ionisation 2. The recesses of the nasal fossæ were packed with strips of gauze or cotton soaked in a 10 per cent watery solution of argyrol or a 1 to 2 per cent. zinc sulphanilate. One or two thin zinc rods similarly covered were placed amidst the packing and connected to the positive pole, the negative being on the neck, the vestibule insulated with gutta-percha tissue; 10 to 20 milliampères were passed for from 10 to 20 minutes, repeated once in five or seven days. This after two or three months gave good results in two or three not very advanced cases, whether the results would continue to be worth the trouble remained to be seen; one case had relapsed after a severe cold. After the best results by any method such mucous membranes remain very vulnerable and readily take on purulent inflammation on slight provocation. 3 Dionisio claimed good results with light treatment; the tediousness of the method caused Dr. Adam to try the x rays in two cases; this failed, as it could hardly help failing, for want of a proper tube which was now being made.

The proceedings closed with a cordial vote of thanks to the President of the section.

PHYSIOLOGY.

WEDNESDAY, JULY 29TH.

This section met under the presidency of Professor E H STARLING (London).

Dr. J. B. LEATHES (London) opened a discussion on

The Physiology of Purin Metabolism.

He reviewed some of the different opinions held upon this subject up to the present time and proceeded to state the conclusions to which his own experiments had led him. He did not consider it possible to lay down any fixed rule regarding the purin metabolism of any individual in identical conditions. He had found with regard to the secretion of endogenous uric acid that it was markedly increased by fever and exposure to cold and after severe exertions The increased output coincided and terminated with the febrile rise of temperature, coincided with and outlasted by many hours the exposure to cold, followed the exertions and lasted for many hours after them. It was suggested that in all these three conditions the uric acid had its origin in metabolic processes occurring principally in the voluntary muscles and not immediately related to voluntary contractions and work. The daily tide in uric acid excretion, high output in the morning, the maximum being attained about 10 A.M., and low output at night, was not due to retention of uric acid formed during the night; nor was it due to the fact that the digestive organs were inactive during the night, if that were a fact, with the last meal taken at 9 or 10 P.M., as in most of their experiments. It was rather due to the quickened activity of all functions, especially those of the voluntary muscles, which resulted from the rest of sleep. Generally speaking, he considered that the more lively the performance of the functions of the body as a whole, the greater the amount of uric acid produced would tend to be. The endogenous uric acid tide was independent of food. He did not believe in the retention of uric acid in the system, for the kidneys always got rid of it The exogenous secretion of uric acid was, on the other hand, affected by foods but a given food might increase its elimination without its itself containing any purin bodies.

Dr. D. CHALMERS WATSON (Edinburgh) dealt with the clinical aspect of the subject. He referred to the results of his earlier observations on the excretion of uric acid in gout, arrived I found her extremely pale with thin, feeble pulse, which was regular and 88; the temperature was 97·5° F. The tumour in the fornices was as before and there was also a tumour in the left iliac fossa of about the size of a cricket ball; there were great pain and tenderness. Obviously the expectant treatment could not be risked any longer, nor did it seem to me reasonable in view of the premises (four rooms for a man and his wife and six children, one of whom was an imbecile, not to mention dogs, cats, goats, ducks, and chickens) to operate at the patient's home. I injected a quarter of a grain of morphine hydrochloride and four hours later repeated the dose and ordered the patient to be brought in to Nannine on a bed slung in a cart. I telegraphed for a colleague (Dr. Young) to give an anæsthetic and when he came, at 12 noon on May 15th, I operated with my wife and two nurses assisting me.

The tumour now reached half-way to the umbilicus and right across the abdomen. I opened the abdomen in the mid-line and the sheath of the rectus a quarter of an inch from the middle. Immediately below the peritoneum I saw a black mass; I opened the peritoneum, raised the omentum and the transverse colon, and evacuated two and a half pints of black blood and clot. Practically there was no bleeding at the operation. The left tube was found at a distance of one and a half inches from the uterus burst and ragged in its superior aspect; the inner, exposed, ragged surface of the tube was one inch long and three-quarters of an inch in breadth. The embryo could not be found nor any bleeding point. The patient was now cold and pulseless. The tube was ligatured on each side of the rupture and the peritoneum was rapidly closed, as well as the sheath of the rectum, the subcutaneous tissue and the skin, and the patient was put back to bed at 1.30 P.M. A two-pint infusion of normal saline solution was run slowly into the rectum and this was repeated on the following day, the foot of the bed being raised. On the day after the operation the temperature was 100°, falling to normal on the following day and never rising above this afterwards. On the tenth day the stitches (continuous silk) were removed from the skin and a small amount of golden serum was found *in places*. The skin edges had not healed and were approximated with grid-iron indiarubber plaster and in a fortnight from the date of the operation had healed. On July 7th the patient was getting about again and feeling quite well but was not allowed to work.

Had an abdominal surgeon been obtainable I should not have attempted this operation, though its happy result, due, I think, to the large amount of work which Mr. F. C. Wallis generously gave me to do when I was house surgeon to him, has justified it.

Nannine, J. P. Murchison District, Western Australia.

Reviews and Notices of Books.

Adenomyoma of the Uterus. By THOMAS STEPHEN CULLEN, Associate Professor of Gynæcology in the Johns Hopkins University; Associate in Gynæcology in the Johns Hopkins Hospital. Illustrated by HERMANN SECKER and AUGUST HORN. London and Philadelphia: W. B. Saunders Company. 1908. Pp. 270. Price 21*s.* net.

THE interesting group of tumours known as adenomyomata of the uterus of late years have been studied by a number of workers in gynæcology with the result that our knowledge of their structure and mode of origin is much more complete than it was. In the year 1903 Dr. Thomas Cullen, in a review of the literature published in Professor Orth's "Festschrift" reported 22 cases of this kind which he had studied personally. Since that date he has paid special attention to these tumours and in a series of 1283 cases of myoma examined he found no less than 73, or about 5·7 per cent., instances of adenomyomata.

It was in the year 1896 that the important work of von Recklinghausen first drew attention to this curious variety of tumour composed of gland elements and myomatous tissue. At that time, after a careful consideration of all the published cases, von Recklinghausen thought that the glandular elements were derived from the Wolffian ducts. This opinion was based upon the supposed close analogy between the elements of the Wolffian ducts and the glandular structures present in adenomyomata of the uterus. In only one case did he find that the glands were derived from downgrowths of the uterine mucous membrane.

In his previous work on this subject, published in 1903, Dr. Cullen brought forward a good deal of evidence to show that the glands occurring in these tumours were derived in reality from the mucous membrane of the uterus, and his further investigations have tended to demonstrate the truth of this view. Of 50 uncomplicated cases of diffuse adenomyomata of the uterus in every one he has been able to trace the uterine mucosa extending into the myomatous tissue. In five out of six cases of adenomyoma of the uterus, complicated by a squamous-celled carcinoma of the cervix, the origin of the gland elements in the myoma could be traced to the uterine mucosa. Not only in the great majority of cases can such an origin of the gland tissue be established, but that these glandular spaces are in reality portions of the uterine cavity is shown by the fact that often they contain blood evidently menstrual in character, and in a few instances decidual changes have been conclusively demonstrated in them.

We think that no one can read this book without becoming convinced that the author's view as to the nature of these tumours is the correct one. Not only has Dr. Cullen shown that von Recklinghausen's theory is no longer tenable but he further points out that there is a very definite clinical history associated with these tumours. Increased loss at the menstrual periods is accompanied in typical cases by grinding pain in the uterus which is attributed to increased tension, since the islands of mucosa scattered throughout the diffuse myoma swell at the menstrual period and thus increase the size of the organ. As a rule there is no inter-menstrual discharge, as the uterine mucosa is usually quite healthy. The tumours are essentially benign and there is no risk of their recurrence after removal.

This book is a good example of how such a monograph should be written. A large number of cases are recorded in sufficient detail to enable the reader to draw his own conclusions, there are a number of beautiful illustrations, and the results of the author's work are clearly and concisely summarised. This is an excellent work worthy of the high reputation of the author and of the school from which it emanates.

The Theory and Practice of Hygiene (Notter and Firth). Revised and largely re-written by R. H. FIRTH, Lieutenant-Colonel, R.A.M.C., formerly Professor of Hygiene in the Royal Army Medical College; now Officer in Charge of the School of Army Sanitation, Aldershot, &c. Third edition. London: J. and A. Churchill. 1908. Pp. 993. Price 21*s.* net.

ALTHOUGH this volume is nominally the third edition of "Notter and Firth," there has been such a re-arrangement of the subject matter and such a re-writing of the chapters that it constitutes what is practically a new work by Lieutenant-Colonel Firth. The author has had, as all writers who endeavour to combine the science and law of public health appear to have, considerable difficulty in deciding how to treat sanitary law, but although he may not altogether have succeeded in solving the problem he has, we think, made a useful advance. In former editions sanitary law was dealt with separately; in this the general legal provisions appertaining to sanitary authorities are treated of in the first chapter; while the law relating to special subjects, such as water and milk, is dealt with at the end of the chapters dealing with these subjects. In this and was not followed by any unpleasant effects. The question of prevention might be summed up in one word, "latrines." It had been a struggle of years to get employers of labour to recognise the need for latrine accommodation. When he first advocated it he was met by the objection that the coolie would never use them, but experiment had proved that that was not the case.

Dr. G. A. TURNER (Transvaal) read a paper on

Ankylostomiasis in South Africa.

He gave an account of the geographical distribution of ankylostomiasis amongst the natives of South Africa, based on microscopical examination of fæces and on necropsies. The disease was absent from all the temperate parts such as Cape Colony (excepting De Beers mine), Orange River Colony, Basutoland, Bechuanaland, and most of the Transvaal. Gold miners on the Rand, both European and coloured, were not being infected there or, at any rate, only to a very trivial extent, notwithstanding that infection was pouring down the mines daily and hourly. Probably this was due to several factors, such as the acid reaction of the mine waters, the low temperature of some mines, and the dryness of some workings. One mine was an exception to the general rule; it was a deep, wet mine with a high temperature and alkaline-reacting water. In this mine every European employed who went below ground contracted the disease.

Dr. A. MAY (Government bacteriologist, Transvaal) presented

A Preliminary Report on the Inhibitory Action of Dilute Solution of Acid on the Development of the Ova of the Ankylostoma Duodenale.

His experiments showed that dilution of sulphuric acid up to the strength of 0·07 per cent. did not prevent the development of the ova into larvæ but prevented further growth. Dilutions of 0·25 to 1 per cent. of acid seemed to prevent the development of the ova.

Dr. L. NATTAN-LARRIER (Paris) made some remarks on the treatment of ankylostomiasis by thymol and filix mas.

Dr. L. W. SAMBON (London) said that, with Stiles and Manson, he was thoroughly convinced that the proper disposal of the fæces was by far the most important measure for the prevention of ankylostomiasis. All other measures would be useless if the infective excrements continued to be scattered over the soil and they would be unnecessary if the same were properly disposed of. He must say at once, however, that that statement was based on the belief that the endemic anæmia of man was caused by a worm incapable of affecting any other host and that their knowledge of the life-history of that parasite was now correct and complete. Unfortunately those premisses were disputable. In the first place, the endemic anæmia of man was not everywhere due to one and the same parasite. They already knew that besides ankylostoma duodenale they had to consider necator Americanus and triodontophorus diminutus. Possibly other forms would be found. Those already known belonged to different genera, and two of them were known to have a world-wide distribution. Secondly, it was not definitely proved that these parasites belonged to man exclusively, and that all allied forms in the lower animals were specifically distinct. The forms found in apes appeared to be identical with those of man, and Schaudinn had succeeded in infecting monkeys with ankylostoma duodenale. Moreover, other species, such as ankylostoma caninum, occurred in a number of different hosts. Thirdly, there were many points in the life-history of those parasites which were still obscure. They did not know the relative importance of mouth and skin infection. When introduced by the mouth did the larvæ invariably pass straight down to the intestine? Might they not penetrate the walls of the œsophagus? They were rarely found in the stomach and duodenum. They had been seen in the walls of the œsophagus and in the stomach beneath the epithelium. They knew that the immature worms might appear in the jejunum and upper part of the ileum as soon as 42 hours after penetrating the skin, but they did not know how long they might tarry over their migrations. They had been found in the lymph glands and other organs at a stage of growth which as a rule they only attained after reaching the intestine. According to Looss the parasites after penetrating the skin forced themselves into the cutaneous veins and, carried by the blood, reached the right heart, then the lung. Here they passed from the vessels to the air cells, and finally creeping up the air passages they crossed over the larynx and slid down the œsophagus to the stomach and then to the small intestine. Of course Looss had thoroughly proved in the case of ankylostomiasis the truth of the old popular belief that certain parasitic worms might enter the body by way of the skin, and his experiments with ankylostoma duodenale and ankylostoma caninum had been confirmed by numerous and able investigators not only with these worms but also with necator Americanus and strongyloides stercoralis. He was also perfectly aware that, as pointed out by Looss, the larvæ of ankylostoma duodenale reached the lungs and might be found in considerable numbers either in the walls of the air passages or within their lumen. Indeed, Rainey had found them in the trachea half a century before Looss. But as he (Dr. Sambon) had stated elsewhere, he doubted the correctness of the last part of the journey from trachea to jejunum as traced by Looss viâ the larynx—œsophagus—stomach—duodenum, or at any rate he did not believe it could be the usual route. He (Dr. Sambon) believed that the majority of larvæ penetrated the lumen of the jejunum and upper part of the ileum through the wall of the bowel. In evidence he would point to the absence of parasites in the stomach and duodenum, to the intense hæmorrhagic inflammation of the jejunum at the beginning of the infection and entirely subsiding later notwithstanding the presence of enormous numbers of parasites in the intestine, and to the actual presence of immature worms in blood-filled spaces beneath the intestinal mucosa observed again and again by Bilharz, Griesinger, Sonsino, Grassi, and others. Finally, he thought that analogy with the life-history of other intestinal worms supported this mode of entrance. Then, again, they did not know how long the adult worm might live within the intestine. Some said weeks, others months, others years. They knew for certain that the females matured and began to discharge their ova about four weeks after penetrating the skin. The process of egg-laying might continue for a considerable time, but it was unlikely that the longevity of the parasite might explain infections of 8, 15, or 20 years' duration. It would be important to ascertain the exact rôle played by reinfection in such cases. With regard to the anæmia, they were still uncertain whether to ascribe it to blood-abstraction, to venom secreted by the head-glands of the parasite, or to secondary infection. The blood-abstraction theory had been considerably shaken of late since it had been practically demonstrated that the parasite was not a true blood-sucker. The toxin theory had more partisans than facts in its favour; the microbic theory seemed more in accordance with recent investigations. Certainly many individuals harboured the worm without showing any signs of obvious illness, and perfect health did not appear to be inconsistent with the presence of hundreds of parasites. These and many other questions in the life-history of the parasite were of the highest importance with regard to the prophylaxis and treatment of the infection and should be thoroughly worked out because the more complete their knowledge of the bionomics of the parasite the better their chances of efficient prophylaxis and treatment. In the present state of their knowledge, which was no doubt correct in the main lines, they could safely state that the prophylaxis of ankylostomiasis lay chiefly in the proper disposal of the infected excreta. Besides, any measure taken against fæcal contamination of the soil would be amply repaid because it would not only tend to stamp out ankylostomiasis but also many other diseases due to bacteria, to protozoa, or to metazoan parasites which left the body by way of the intestine. And he would again point out, as he had done at a previous meeting some years ago, that whatever was the method employed, human fæces should never be used for agricultural purposes because they were far too dangerous, especially when used for the manuring of vegetables that were eaten raw. It would be a great mistake to rely on fermentative processes or even chemical disinfection to render contaminated fæces innocuous. The powers of resistance shown by the spores of certain worms, the encysted stages of certain protozoa, and the ova of certain worms were almost incredible. If they could not be destroyed in the laboratory how could they expect to destroy them in nature? Whilst modern science had only recently dichroic solution, while platinum and palladium give black solutions. It is not possible to obtain more than a certain strength of solution by such means, and when this is reached the metallic cloud no longer dissolves. At this stage the solution is filtered through fine filter-paper. The liquid must not be sterilised by heat or by means of bacterial filters, as both these procedures destroy its ferment actions. the addition of salts to render it isotonic is also said to diminish its activity, but the utmost care must be taken in preparation to insure sterility. The solutions employed by Professor Robin contain about 33 milligrammes of metal per litre. Examined microscopically no particles are seen, but by means of the ultra-microscope a number of luminous points can be observed. The properties of the solutions appear to be identical in the case of the different metals used except that from the therapeutic point of view those of palladium are the most active. Somewhat similar solutions can be obtained by chemical methods. Professor Robin claims that these substances produce effects in the body similar to those of organic ferments and to those of certain therapeutic serums. He states that all these substances increase the formation of urea, of uric acid, and of urinary indoxyl, that they augment the co-efficient of nitrogenous utilisation without increasing proportionately the oxygen absorbed by the organism. They further affect the hæmopoietic organs, causing a true leucolysis of the polymorphonuclear cells, especially in those conditions where they are increased in number while they augment the numbers of mononuclears. They also exert a microbicide action.

Professor Robin has employed these solutions in a variety of conditions, notably in the treatment of pneumonia, in which disease he claims that they lower the temperature, raise the arterial tension, and often accelerate the crisis, and that if employed sufficiently early they diminish the mortality. He gives details of his methods of treatment in that disease. He administers the bichlorhydrate of quinine in doses of 0·3 gramme night and morning throughout and gives several small doses of calomel. On about the second day of the disease he injects subcutaneously ten cubic centimetres of the solution of the metallic ferment, and this is repeated every day. Pyramidon is also given at night. About 24 hours after the first or second injection a large blister is placed over the site of the pneumonia. It is difficult to estimate the effect of these so-called *ferments* in this somewhat complex method of treatment. Professor Robin has treated 95 cases on these principles, 47 being of severe nature, and has had a mortality of 13·68. In 70 per cent. of the cases the defervescence occurred before the eighth day. Details are given of the use of these substances in many other diseases, but the accounts hardly seem to lead to any striking conviction of their usefulness.

LIBRARY TABLE.

The Edinburgh Stereoscopic Atlas of Obstetrics. Edited by G. F. BARBOUR SIMPSON, M.D. Edin., F.R.C.P. Edin., F.R.C.S. Edin., Senior Assistant to the Professor of Midwifery in the University of Edinburgh; and EDWARD BURNET, B.A., M.B., Ch.B. Edin. With a preface by Pro fessor Sir J. HALLIDAY CROOM, M.D. Edin., F.R.C.P. Edin., F.R.C.S. Edin., F.R.S. Edin., Professor of Midwifery in the University of Edinburgh. In Four Sections, each containing 25 subjects, with descriptive text. Section II London: The Caxton Publishing Company. 1908.—The Second Section of this Atlas, a review of the first part of which appeared in THE LANCET of July 25th, 1908, p. 240, contains 25 subjects with descriptive text. The plates are mainly concerned with the anatomy of the normal pelvis and its contents and specimens of the pregnant uterus at the various months up to the eighth month of gestation. Dissections of the pelvic organs, or indeed of any kind, do not lend themselves so readily to reproduction in photographs as do the various forms of contracted pelves and the results, therefore, are not so satisfactory. The plates illustrating dissections of the female perineum, for example, show but little, and it is practically impossible to reproduce a dissection by photography in such a manner as to be of much value to the student, and the same criticisms apply to the plates illustrating the organs occupying the interior of the pelvis. For these reasons the present section of this Atlas is not likely to prove so useful as the first. The photographs are all good but the subjects are unsuitable to this form of illustration. The main features of this publication have already been noticed and no doubt in the succeeding sections the plates will be as good and useful as were those of the first section.

Rotunda Midwifery for Nurses and Midwives. By G. T. WRENCH, M.D. Lond., late Assistant Master, Rotunda Hospital, Dublin. With an introduction by the Master of the Rotunda Hospital. London: Henry Frowde and Hodder and Stoughton. 1908. Pp. 324. Price 6s. net.—Impressed by the difficulties which nurses of average intelligence appear to have in understanding the text-books written for their use Dr. Wrench has been emboldened to try to write a book which shall be sufficiently clear and free from technical terms as to be readily understood by any ordinary pupil midwife. On the whole he has succeeded very well. The teaching contained in this book is that given at the Rotunda Hospital, and the main elementary facts of midwifery practice are set forth in a clear, practical, and convincing manner. As Mr. E. Hastings Tweedy truthfully points out in the preface which he contributes to the book, the difficulties which beset the path of a woman possessed of no technical knowledge who suddenly finds herself placed as a probationer in a large hospital are considerable, and in the case of those women who attempt to satisfy the requirements of the Central Midwives Board by a course of study outside a hospital they must be very great indeed. The art of writing a text-book for junior students or for nurses is not possessed by everyone and considerable credit is therefore due to Dr. Wrench for the success which he has attained. The teaching is dogmatic and there is no ambiguity in the methods of treatment recommended although they may not commend themselves to everyone, and the book is in many ways an epitome of the larger work recently published by Mr. Hastings Tweedy and the author entitled, "Practical Rotunda Midwifery." The author is sound in the advice which he gives to nurses as to the dangers of trusting to their personal experience in the matter of advising their patients and thereby usurping the functions of the medical attendant. In a concluding section Dr. Wrench calls attention to the important duties of the nurse in acting as an intelligent intermediary between the patient and the medical man in cases of danger, and to the fact that coöperation between the nurse and a medical practitioner adds greatly to the safety of the patient whom the nurse is attending. Some of the illustrations are not very artistic but still they are clear and should be intelligible. On the whole this is a capital little book which we can recommend confidently to nurses.

JOURNALS AND MAGAZINES.

The Journal of Physiology. Edited by J. N. LANGLEY, Sc.D., F.R.S. Vol. XXXVII., No. 3. London: C. F. Clay. August 12th, 1908. Price 7s.—The contents of this number are:—1. An article on the Contraction of Muscle chiefly in Relation to the Presence of "Receptive" Substances, Part II., by J. N. Langley, F.R.S. In this article the action of nicotine on the flexor carpi radialis frequent recurring attacks of lymphangitis were not ordinarily attended by any general lymphatic obstruction. The same might be said of the more chronic ulcerations with the exception of that due to the pudenda. In the latter disease the obviously enlarged, no secondary deposits took place, and yet chronic lymphatic obstruction occurred giving rise to swelling of the penis, scrotum, or vulva, resembling ordinary tropical elephantiasis though rarely attaining any great size. With regard to lymphatic bacterial diseases the plague bubo was the one most definitely associated with the tropics. Closely resembling in clinical aspects the rare ambulant cases of bubonic plague were the so-called climatic buboes. In those, also, there was no evidence of lymphangitis, but the glands were enlarged and tender with some febrile disturbance, and in the few cases which he had seen there had been definite suppuration. No plague bacilli were found. The lymphatic diseases more especially associated with tropical conditions were those due to animal parasites. In many of them the eggs were deposited, amongst other places, in the glands, and might, as in schistosoma Japonicum, be very numerous. In such cases the glands were enlarged and fibrotic, but there again no obstructive symptoms occurred. In most tropical countries elephantiasis was common and other evidences of lymphatic obstruction, such as chyluria, were also fairly common. Much speculation as to the causation of that condition had taken place. Lymphatic obstruction was not confined to the tropics; rare cases occurred in England and were indistinguishable from tropical elephantiasis. Personally he had seen two cases. How was it that lymphatic obstruction sufficient to cause chronic œdema, a rare disease in England, in the tropics might affect 5, 10, or 15 per cent. of the population? They knew that elephantiasis might occur from several causes, but its frequency in the tropics claimed a special cause. The discovery of filaria Bancrofti in the lymphatics naturally suggested a plausible hypothesis to account for this difference in frequency. Filariæ were common in the tropics and unknown in temperate climates, as elephantiasis was or nearly so. The connexion between filariasis and elephantiasis was strongly indicated by identity of geographical, topographical, racial and sex distribution, and was further supported by an exactly similar distribution of known intermediate hosts. Thornhill in Ceylon had shown that in natives of Colombo filariasis and elephantiasis were rare compared with certain places a few miles out. Low in the West Indies had proved that a definite ratio held good. In British Central Africa the relationship was very definite; in large tracts of the country there were no elephantiasis and no filariasis. On the Shiré highlands both filariasis and elephantiasis were found only in immigrants. On the lower Shiré river filariasis was common and elephantiasis occurred. Higher up the river neither was found. At the south end of Lake Nyassa he had found no elephantiasis, only one person with filaria and scanty mosquitoes capable of transmitting the infection, whilst at the north end he had observed fairly numerous cases of filaria, several cases of elephantiasis, and an abundance of suitable mosquitoes. Observations of that kind could be multiplied indefinitely. They all confirmed the relationship. The old objection that cases of lymphatic obstruction were the cases in which fewer people harboured filarial embryos than the average population need not detain them. All it meant was that in lymphatic obstruction the embryos were not able to enter the circulation. How did the filaria lead to lymphatic obstruction? In the first place it caused thickening, dilatation, and other changes in the wall of the channel; occasionally it gave rise to hæmorrhage. He had himself seen dilated masses of lymphatics, containing living filariæ, distended with recently coagulated blood Again, suppuration with abscess formation might occur, either as a result of the death of the worm or in some way connected with its presence, and in the contents of such abscesses remains of the worm had been found. Elephantiasis might occur as a direct sequence of a single attack of acute inflammation or after repeated attacks of a similar nature, or gradually without pain or any erysipelatoid attack. He did not think it necessary that all cases of elephantiasis need be assumed to be produced in the same manner by the filaria. In some it might be hæmorrhage, in other perhaps more common it was merely that the lymphatics distended and altered by the filariæ were more liable to inflammation. The acute lymphangitis was probably due to the introduction of bacteria. Manson believed that the adult worms under conditions aborting were the real cause of some cases ruction. The aborted embryos instead of being fully tched as when normally discharged were still coiled up in their egg capsules which, according to the stage of development, might be round or elliptical. Their shorter diameter being larger than the smallest lymphatic channels the ova were stopped in the glands and blocked up all the anastomosing branches till there was complete obstruction. Manson's hypothesis had not received the full consideration which it required. It seemed to have been condemned tacitly as too complicated and involving a whole series of suppositions. On analysis, however, every point in the hypothesis rested on actual observations. It was more than plausible; it was a logical sequence that must almost necessarily follow and gave a complete explanation of the phenomena observed.

Dr. W. T. PROUT (Liverpool) said that in Europeans a bubo which was called "malarial" or "climatic" was occasionally found. As to the former he had seen no evidence; as to the latter, there was undoubtedly a form of suppurative lymphadenitis for which there appeared to be no appreciable cause. The name given to this disease was only an expression of ignorance. He contended that facts of geographical distribution were opposed to the theory of relationship between elephantiasis and filariasis In his opinion elephantiasis was a streptococcal disease.

Sir PATRICK MANSON was glad that Dr. Daniels had given an accurate outline of his views, which were generally misunderstood. He did not say that the hypothesis had been proved; he recognised the propriety of an attitude of doubt towards it, but not of denial. To his way of thinking it was a most probable explanation of the facts.

Dr. SAMBON said that Dr. Daniels had very ably shown that there was much evidence in favour of a relationship between tropical elephantiasis and filariasis. In Europe cases indistinguishable from tropical elephantiasis were occasionally met with; they were looked upon by some as disproving any connexion between filariasis and elephantiasis in tropical countries. He was not going to discuss the various causes which might bring about lymphatic obstruction in Europe, but he wished to point out that a filarial predisposing cause was by no means excluded in European cases of elephantiasis. Filaria Bancrofti had a very wide distribution and was certainly found on the African and Asiatic coasts of the Mediterranean. Possibly it occurred also on the European side. At any rate its occasional appearance there was more than probable; indeed, a well-authenticated case had been described in 1894 by Dr. M. Font y Tomб in a Spaniard from Canet di Mar (Barcelona) who had never left his country. That man suffered from chyluria and enlargement of the scrotum. His blood contained filaria larvæ. There was no reason why filaria Bancrofti should not prosper in certain parts of Europe. They knew that innumerable species of filariæ lived in the mammals, birds, and reptiles of Europe; some also in man, as, for instance, filaria labialis, filaria conjunctivæ, and other ill-determined species. All these filariæ were fostered and transmitted by arthropod intermediary hosts, which might be flies, mosquitoes, or ticks, according to the species Filaria immitis, the "cruel filaria" of dogs, had a very wide distribution in tropical and sub-tropical countries, but it was found also in Northern Europe (France, Germany, Denmark, and England) Like filaria Bancrofti it was propagated by mosquitoes

Dr. J. L. MAXWELL (Formosa) pointed out that the island of Formosa was in practically the same latitude as Amoy on the mainland; the inhabitants were for the most part Chinese immigrants from the Amoy region; the customs, habits, and diseases were with one exception exactly the same, that exception being the presence of filariasis and elephantiasis as a very common disease in the Amoy region, and the almost complete absence in Formosa of both diseases.

Captain J. W. D MEGAW, I.M S., stated the facts which he had observed in two districts in Bengal. In Puri, where elephantiasis was common, in 100 prisoners whose blood was taken at night and examined filarial embryos were found in 15. (Three of the prisoners suffered from elephantiasis; in none of these were filarial embryos found.) In Dinajpur, where elephantiasis wa in 50 prisoners taken at random of adenoma. Throughout the paper reference is made to illustrations which are not contained in the present number of the magazine so that it is difficult to follow some of the statements made as to the histology of the new growths with which the author is dealing.

THE
BRITISH MEDICAL ASSOCIATION.

SEVENTY-SIXTH ANNUAL MEETING AT SHEFFIELD.

THE SECTIONS.

DISEASES OF CHILDREN.

THURSDAY, JULY 30TH.

Sir ALMROTH E. WRIGHT (London) opened a discussion on

The Causation and Treatment of Scurvy, in particular of Infantile Scurvy.

The object of the discussion, the speaker said, should be to seek for (*a*) the pathogenic factor in the scorbutic dietary; (*b*) an explanation of the scorbutic symptoms; (*c*) for a scientific method of diagnosis; and (*d*) for a rational method of prophylaxis and treatment. With a view to eliciting the pathogenic factor in the scorbutic dietary foodstuffs might be divided into three classes: (1) acid, scorbutic (oats, barley, meat, wheat, eggs, rice, and maize); (2) non-scorbutic (sugar, vegetable oils, and animal fats); and (3) alkaline, anti-scorbutic (carrot, turnip, potato, onion, milk, blood, peas, lemon, orange, beans, and woody fibre). These were arranged in order of intensity. The acid series exhibited an excess of mineral acid over base in the ash and the alkaline series an excess of base over acid, while the non-scorbutic were neutral. This suggested that in scurvy there is an acid *intoxication.* Infantile scurvy was associated with a diet of cereals and sterilised milk. Milk that had been boiled clotted loosely with rennet or not at all. On the addition of calcium salts it clotted as fresh milk. They knew that when urine was boiled carbon dioxide was driven off and phosphate of lime was deposited, so that the lime was held in solution by carbonic acid. Milk which had stood for from 12 to 24 hours scarcely clotted at all in its upper layers on addition of rennet, whereas the lower stratum clotted at once, this contrast being due to separation and subsidence of lime salts. The symptoms of scurvy were pain and hæmorrhage in connexion with the periosteum and effusion into muscle sheaths. Free acid would affect the bones, and cases were known in which callus had been absorbed during an attack of scurvy disuniting a recently healed fracture. At Netley six men suffering from scurvy after the siege of Ladysmith showed a diminished alkalinity of the blood, the reaction being almost neutral. When the citrate and tartrate of sodium were administered the symptoms disappeared rapidly, while the alkalinity of the blood increased to normal. Cases of infantile scurvy showed a similar decline in alkalinity, the symptoms disappearing and the reaction becoming normal after three days' treatment with 10 grains of lactate of sodium. Potato, orange-juice, and meat-juice with lime water had affected the disease more slowly. So long as the acid could be neutralised by ammonia in the system no effect was produced on health, and this afforded a temporary defence. Later lime salts were extracted from bone and then from the blood, with manifestation of scorbutic symptoms. The objection to alkaline foodstuffs as treatment was the small amount of effective remedy contained in a large bulk. Lime-juice contained only 0·3 per cent. of citrate of sodium. Lactate of sodium was best and rendered the urine alkaline in 15 minutes. Erosion of bone required lactate of lime and magnesia; in such a condition fruit juices were objectionable as they tended to take up more lime salts.

Professor AXEL HOLST (Christiania) stated that guinea-pigs fed only on bread or oats with water died in a few weeks. After three weeks the molar teeth became loose, the gums hyperæmic, hæmorrhage occurred at the costo-chondral junction, and there was fragility of the long bones with softening and hæmorrhage at the growing ends, these changes being the same as those in adult and infantile human scurvy. Microscopically the lymphoid cells of the red marrow disappeared at the epiphyses, being replaced by a fibrillated reticulum and hæmorrhage. Real scurvy had thus been experimentally produced in guinea-pigs, and could be abolished by an anti-scorbutic diet. Professor Holst considered the acid theory was wrong but was doing more good than some right ones. Fresh boiled potato prevented scurvy, but dried potato or carrot did not do so even when soaked in solutions of calcium or sodium salts. The juice of cabbage was a preventive when fresh but not after having been kept for a month when it became acid, and addition of bicarbonate of sodium did not restore its anti-scorbutic properties. Barley soaked in water did not prevent scurvy, but if allowed to sprout it did. It was then a *living plant, though the* salts contained were the same. The addition of carbonate of lime or citrate of sodium to bread did not prevent scurvy, which appeared to be due to the exclusive use of food devoid of certain unknown constituents. We were accustomed to apply the word enzymes to the causes of biological effects not explained by bacteria and anti-scorbutics possessed a quality peculiar to enzymes, in that they acted in small quantities, though more powerfully in large. Guinea-pigs fed on oats and water died from scurvy; the addition of one ounce of cabbage daily prevented this. If the cabbage were reduced to one gramme daily the animals lived from six to eight weeks and died without getting scurvy. In conclusion, Professor Holst said that in seeking for the cause of this disease they must look for the unexpected.

Dr. R. HUTCHISON (London) said that the consideration of scurvy in children simplified the question by excluding a number of supposed causes, including the ptomaine theory. In them it appeared rather to be due to over-sterilisation of food. The importance of potash salts as a preventive had been over-estimated, except so far as the potassium salts of the vegetable acids were concerned. He did not agree with Sir Almroth Wright's theory. It was found that the anti-scorbutic properties of any food resided in the dialysate which comprised the crystalline portion with the potassium salts of the vegetable acids. The vegetable salts of potash were decidedly anti-scorbutic. Dr. John Thompson treating pyelitis in a scorbutic subject with citrate of potassium found the scurvy *arrested.* Ralfe found the anti-scorbutic foodstuffs more alkaline than the scorbutic, and Bunsen claimed that foods should have an alkaline ash to sustain life. K_2HPO_4, though unsaturated as to base, was alkaline to litmus. Dr. Hutchison considered that the ash of the scorbutic group of foods should be regarded as less alkaline than that of the anti-scorbutic rather than definitely acid. Neutralisation by *ammonia* would diminish acidity and would not be revealed in the ash. He cited also other instances of acid intoxication, such as that occurring in diabetes, which did not give rise to symptoms of scurvy. Citric acid actually increased the acidity of the urine and lime-juice similarly tended to diminish alkalinity. Reduced alkalinity occurred in cachexia and anæmia as well as in scurvy. The coagulability of the blood was to be taken with great caution, and was not shown to be constantly diminished in infantile scurvy, while in scurvy itself there was no constant relation between diminished alkalinity of the blood and the intensity of symptoms. He claimed that there was an unknown factor in the production of the disease still to be discovered. Very few infants developed the disease, though very many were on the same diet.

Dr. E. CAUTLEY (London) said that infants suffering from scurvy were fat and otherwise healthy. No acetone bodies occurred and he had only found the urine ammoniacal once, though this was usual with acid states. The disease was undoubtedly associated with artificially prepared food.

Sir ALMROTH WRIGHT, after replying to the arguments which had been advanced in opposition to his view, said that it was essential to know the actual cause of scurvy for its effectual prevention and to recognise the disease before the extreme phases developed. He considered that diminished alkalinity of the blood was a guide to this and should be looked for in suspected cases.

Dr. W. ESSEX WYNTER (London) read a paper on

A New Specific in the Treatment of Chorea.

After reviewing the methods formerly employed and commenting on the long duration of the attacks, he described the new remedy chloretone, which was trichlor-tertiary-butyl-alcohol. Physiologically this drug in therapeutic doses acted as a powerful sedative to the central nervous

THE LANCET.

LONDON: SATURDAY, SEPT. 5, 1908.

Psycho-Therapeutics.

SUPERSTITION extinguished in one of its manifestations ever tends to recrudesce in some other form. There is a large and seemingly necessary place for it in the life of man, and in what we may call a scientific disguise it occupies the public attention at the present time in a constantly increasing degree. With the growth of a knowledge of hygiene, chiefly derived from the lengthy advertisements of different varieties of nostrums which, with diagrams of the nervous or other systems, ornament our lay press, we are perpetually being confronted by our patients with problems which to us at present insoluble are easy of explanation by those who pretend to a knowledge they do not in fact possess. So it has come about that now, probably to a greater degree than ever before in the history of the world, organised charlatanism reaps its enormous profits. In an interesting Epitome of the *Progress of Psychiatry in America* which was published in the *Journal of Mental Science* for April, 1908, Dr. WILLIAM McDONALD, jun., gave a graphic description of the multitude of "prosperous-appearing establishments flaunting in highly polished brazen letters" such trades as those of spiritualism, clairvoyance, astrology, osteopathy, and palmistry, in Boston, U.S.A., a city which is always claimed by its inhabitants as an abode of the intellectuals. Here, too, is the church built to "Mother EDDY, CHRIST, and JOHN the BAPTIST" for a million dollars. But beyond the territories of that which the majority of us would undoubtedly call superstition there lies a sphere of influence over which science can claim some sort of control and which has been developed in Boston in a remarkable way. At the Protestant Episcopal Church of Emmanuel an effort has been made "to weld into friendly alliance the most progressive neurological knowledge of the schools and a primitive New Testament Christianity as scholarship has disclosed it, with a view to the relief of human suffering and the transformation of human character." A group of medical men connected with the church, who have enjoyed a training in neurology and psychiatry that must be of rather an exceptional character, have formed themselves into a clinique, with the result that worshippers at the church have unusual opportunities for obtaining intelligent advice administered out of a rare combination of religious spirit with scientific knowledge and skill. Dr. McDONALD speaks warmly of the enthusiasm which has been aroused, but the reasons for this are quite easy to see.

"The thing that hath been, it is that which shall be; and that which is done is that which shall be done: and there is no new thing under the sun." Without here endeavouring accurately to define suggestion and persuasion, words about which considerable controversy is even now going on, we may explain psycho-therapy as the art whereby we endeavour to treat a patient by altering in some way his mental state, whether we produce that alteration by giving him a so-called placebo or by encouraging him when he is down-hearted or by the more elaborate methods of argumentation. That this is no new thing is well known to anyone who has ever practised medicine, while the practice at Emmanuel Church finds its prototype in hoary antiquity. In Egypt, long since, the sick were laid in the temples of Isis to await the voice of the oracle which should reveal to them the means of cure, while the priests treated them according to the rules laid down in the sacred books Below the Acropolis at Athens facing out towards the Ægean Sea stood the Temple of Æsculapius and, according to the testimony of votive offerings, marvellous cures were there effected chiefly by psycho-therapeutic measures. The imagination was strongly stimulated and processions to the accompaniment of music, prayers to the god, the sanctity of the surroundings, and, perhaps above all, the personal influence of the priests, contributed to the happy results. To other extraordinary and perhaps less elevating agencies, such as have been used from the earliest times to the present, we can only attribute psycho-therapeutic effects HIPPOCRATES advocated in magisterial terms the skin of the viper for the cure of rashes. Among the Arabian physicians precious stones administered internally had a great reputation; in the Roman Imperial court treacle was vaunted as a panacea against fevers, infectious disorders, and intoxications, while later in history mica panis has had apparently as much efficacy as many of the synthetic preparations. To what can we attribute the good effects of the complicated and nauseous prescriptions of not so very long ago? Are we to deny that any effects at all were produced? Or are we to conclude that effects were then produced on the human body which can no longer be produced, or do we nowadays neglect many valuable preparations which have signally succeeded in times gone by? The effects produced were what may be called legitimately psycho-therapeutical. The success of charlatanism throughout the ages is surely evidence enough, even without a consideration of the obsolete practices of our profession, to convince the sceptical that psycho-therapeutic measures at least have their place in any system of medicine. How often is the medical man confronted with the well-authenticated story of some cure wrought by a "rheumatic ring," by an "electric belt," or by some prescription picked out from the lumber of the past and proclaimed as a specific for the most startlingly dissimilar disorders. How difficult it is to reason with those having faith in such agencies. The point of view of the medical man is diametrically opposite to that of such a patient, for the medical man has learned the limitations as well as the possibilities of the therapeutic art. To set forth those limitations is often to be found guilty of professional jealousy, and one of the most difficult of our labours is to get into the minds of our patients what we can and what we cannot do.

That certain mental states are accompanied by certain bodily states is a matter of common knowledge. Terror and fear may produce profuse sweating, dryness of the mouth, and an alteration in the amount of the renal and intestinal decided tardily and to be inconstant, involving as they did the modifications incident on many generations of subculture, they were disposed to rely chiefly on the quicker verdict of agglutination and phagocytosis. Since they only required to know whether phagocytosis was conspicuous by its presence or absence, they need not follow the elaborate opsonic technique of Wright but simply make an emulsion of the youngest possible culture in 1 per cent. sodium citrate solution in normal saline and mix it with an equal volume of fresh blood from the patient (which was thereby prevented from clotting). Incubated for half an hour, and a glance at the stained film would show whether there was any agglutination and whether there was the immense phagocytosis characteristic of the epidemic form or the more or less complete absence of phagocytosis which they found in their sporadic cases.[2] It had been found that, after the oral administration of urotropine, formaldehyde *might* be detected in the cerebro-spinal fluid. This was tried in two of Dr. Eve's and Dr. Clements's cases without decided effect, and they could not detect it in the spinal fluid by the resorcin test. If the sporadic meningococcus turned out to be as constant in type as the epidemic coccus had been shown to be it should be easy when confronted with a Gram-negative meningitis case to answer confidently these practical questions: (1) Was the case likely to be followed by an epidemic? (2) Should the case be isolated? (3) Was the antiserum of Flexner and Jobling likely to do much good or great harm? (4) Should the case be notified as cerebrospinal fever?—i.e., should the occupants of a house, a street, or a city be needlessly terrified for a non-epidemic case as often happened in the scare times last year?

Mr. H. TYRRELL GRAY (London) read a paper on

Herniæ in which Meckel's Diverticulum was Present.

A case was reported of a male child, aged six months, where this structure was present in a right inguinal hernia. About 60 cases were collected from the literature, of which 42 were tabulated. This list showed the usual preponderance of males in lesions of Mickel's diverticulum, and this structure was present 30 times in inguinal and 12 times in femoral herniæ. The commonest age was shown to be more dvanced in this than in other lesions of the diverticulum nd all cases were strangulated or irreducible. Cases were rouped into two types: 1. Those where the diverticulum r part of it was alone present in the sac. This type ccurred in persons of middle or advanced age, tended o be overlooked on account of the insignificance of the ccompanying symptoms and signs, and formed external ecal fistulæ in 41 per cent. of cases. 2. Those where her viscera were also present in the sac. Cases in ildren belonged exclusively to this type, which presnted the usual symptom-complex and clinical course of rangulated hernia. The danger and unjustifiability of tempting reduction by taxis in strangulated herniæ were lustrated, this practice having resulted in death in each case the present series. The danger of a truss, where avoidle, was also touched on. The extreme liability to perforan of the diverticulum was noted in lesions of this structure, d the possibility of *diagnosis* of its presence in a certain umber of cases was briefly indicated.

DENTAL SURGERY.

THURSDAY, JULY 30TH.

THE attention of the section was directed to a discussion the question of

Teething and its Alleged Troubles.

DR. LEONARD G. GUTHRIE (London), in opening the scussion, reviewed the subject historically. Hippocrates served that "teething children suffer from itching of the ums, fevers, convulsions, diarrhœa, especially when they t their eye teeth, and when they are very fat and costive." ristotle attributed convulsions not to dentition but to erfeeding fat and constipated infants. Gradually the octrine developed that most infantile complaints were not erely associated with teething but were caused by reflex isturbances arising by the efforts of the teeth to erupt rough hard and resistant gums. During the dark ages of e seventh to the fifteenth century the whole science of edicine was hampered by superstition, astrology, witchraft, and magic spells and incantations; the Renaissance bringing with it the revival of Greek study, the authority of Aristotle, Hippocrates, and Galen again became ascendant. Ambrose Paré, writing in the sixteenth century, said: "Children are greatly troubled with their teeth, which cause great pain when they begin to break out of their shell and begin to come forth, the gums being broken (which usually happens about the seventh month of the child's age). This pain comes with itching and scratching of the gums, inflammation, diarrhœa, and often gives rise to fever, falling of the hair, convulsions, and at length death," all these being, as Paré says in another passage, due to the contumacious hardness of the gums or the weakness of the child's nature. An old French proverb, quoted by Jean Seultel in 1671, relates to the eruption of the eye teeth: "Les parens ne peuvent pas bien réjouir jusqu' à ce que les dents sous les yeux applées canines soient sorties." Many curious prescriptions were also cited, including the use of an ointment of blood from a fresh cock's comb. The many vicissitudes in the practice of gum lancing were also considered; T. Willis and W. Harris in the seventeenth century, Arbuthnot and Horlock in the eighteenth century, and West and Clendon in the early part of the nineteenth century were quoted. Dr. Guthrie then turned to the modern side of the question and pointed out that the deaths attributed to teething given in the Registrar-General's report show a steady decrease (178 per 1,000,000 in 1886, 63 per 1,000,000 in 1906). Dr. Guthrie thought that teething was only painful when the gums were unhealthy or inflamed and that they might become so as the result of "common colds," gastro-intestinal disorders from overfeeding or improper feeding, or from bruising and infection of the gums from local injury caused by biting on hard, unclean objects. Oral hygiene in infants was therefore of *greatest importance*. Turgid gums might be scarified, not to liberate the teeth but to relieve local congestion. The operation was seldom necessary. Convulsions were much more frequently due to colic than to the teeth. The physiology of the eruption of the teeth, he said, was still a mystery.

Mr. H. A. T. FAIRBANK (London) considered that to ascribe fits or convulsions to the eruption of teeth was most fallacious. As out-patient surgeon to a children's hospital he had many opportunities for verifying or the reverse the many curious statements relating to the association of teething with reflex phenomena. A unilateral fit was not necessarily caused by unilateral irritation, and gastrointestinal toxæmia frequently produced unilateral convulsions. Even the persistence with which an infant displayed a desire to munch any hard substance was not related to the period of tooth eruption only and the pain caused by bruising of the delicate gum covering the rising tooth was quite as often the source of pain as the eruption of the tooth itself. Stomatitis was not to be referred to the eruption of the tooth but to infection with micro-organisms. In three months' careful examination Mr. Fairbank only saw one case in which inflammation was localised to the portion of gum overlying an erupting tooth. The only reflex phenomenon which could be referred to teething was trismus of nervous origin, not that due to inflammatory inflammation of the muscles of mastication. The commonest tooth to give rise to this species of trismus was the wisdom; much less frequently the first or second molar was the cause. A case of trismus in a child the subject of congenital syphilis, aged 11½ years, was described, the source of the spasm being an unerupted second lower molar; the removal of a large flap of inflamed gum over the erupting tooth relieved the symptoms. Local swellings over erupting teeth were usually due to traumatism and as a rule were septic, although sometimes hæmorrhagic; generally the discontinuance of the septic ring or other *article with which* the child was aiding eruption was the only treatment necessary. Mr. Fairbank had often seen spongy gums in infantile scurvy in edentulous mouths and the presence of the teeth was not necessary to the condition. The distension of the tooth follicle with fluid forming a cyst was rare but a well-*marked instance* had recently come under his notice.

Mr. J. G. TURNER (London), in continuing the discussion, referred to the physiological process of teething and force of eruption as being a normal vital process which varied with the condition of the *individual*, and although limited in man to the period of growth was persistent through life in many animals. The unerupted *tooth* was contained in a bony case; before eruption the bony covering was removed, the removal taking spare rather flaccid muscles, scanty subcutaneous tissue, and pale complexion. He found, moreover, that such individuals possess a labile nervous system, with a tendency to irritability, depression, and hyperæsthesic sensibilities. Finding that these peculiarities were associated with the tendency to various ptoses, to neurasthenia, and the various forms of functional dyspepsia, including Reichmann's disease or hyperchlorhydria, he arrived at the generalisation which we have already summarised. Professor STILLER's views have been accepted by many German authorities, by some *in toto*, but by others with certain reservations. On the other hand, they have been strenuously opposed by other authorities, notably by GLÉNARD. One of the most interesting chapters in the book is that in which Professor STILLER deals with his critics. He has an incisive, caustic style and an admirable critical faculty. GLÉNARD, while admitting that such a condition of the tenth rib exists in cases of enteroptosis, denies that it is of congenital origin and attributes it to the pressure of corsets or belts. MEINERT has investigated the condition of the tenth rib in 120 patients and in 100 cadavers, and states that unless great care is taken it is easy to mistake the eleventh rib for the tenth. Professor STILLER, however, states that the tip of the tenth rib is almost without exception to be found in the nipple line, whereas the eleventh lies in the mid-axillary line. MEINERT further states that the condition of free tenth rib is rare, a criticism which Professor STILLER meets by maintaining that he has overlooked all but the most pronounced forms of the defect. Examination of the condition of the end of the tenth rib in the post-mortem room by MEINERT, TANDLER, and FELDMANN revealed the interesting fact that the end of the tenth rib cartilage is normally bound to the ninth by a loose ligamentous connexion which permits of a certain amount of movement. Professor STILLER therefore assumes that during life in the normal person movement is prevented by the tense condition of this ligamentous union, whereas in the person of asthenic type it is not so; he also lays stress upon a defect in length of the tenth cartilage as well as upon its mobility. He further states that in marked degrees of the condition the ninth rib may be free and in rare cases the twelfth may be missing.

---

[2] Vide Houston and Rankin, Brit. Med. Jour., Sept. 15th, 1907.

In discussing the relation of the asthenic constitution to the development of disease it is claimed that this type of organisation strongly predisposes towards pulmonary tuberculosis and chlorosis, and to a lesser degree towards gastric ulcer, achylia, and postural albuminuria. Its relation to pulmonary tuberculosis is very strongly urged; indeed, it is maintained that the supposed typical tuberculous appearance is really that of the asthenic constitution and that the value of the dietetic and hygienic methods of the sanatorium treatment is largely the result of their beneficial effect upon the underlying asthenic habit of body. Professor STILLER's thesis is one of considerable interest and affords material for much thought and for research. It is developed with great skill and is obviously the outcome of prolonged and detailed observation. If it proves on further investigation by other authorities to be correct it may serve to explain many associations which are at present obscure, such as the frequent association of gastro-intestinal disorders with neurasthenia. It may also prove to be useful in regard to prognosis and treatment and in relation to the scheme of education of those in whom the asthenic constitution is recognised in early life.

The Prevention of Tuberculosis (Ireland) Bill.

THE criticisms which some of the provisions of this Bill have evoked have in their turn given rise to a movement intended to aid the promotion of the measure, and at a meeting in Dublin of the Tuberculosis Exhibition Committee of the Women's National Health Association of Ireland, which was attended by delegates from local authorities, some of the points at issue were discussed at length. The outcome of an animated discussion was, as will be seen in the weekly letter from our Irish correspondents, that the principle of notification was approved of by a nearly unanimous vote; and a speech by Sir JOHN BYERS, which we have been able to peruse at length, had in great probability much to do with this result of the debate Sir JOHN BYERS, in supporting a motion in favour of the Bill, drew attention to the fact that many persons felt that as it stood the measure needed amendment and strengthening, and while he thought that Mr. BIRRELL would be quite willing to adopt any modifications which were feasible, he regarded notification as absolutely necessary for dealing with the disease, pointing to the history of the Notification Act in support of his statement. Although there is no need to question the value of notification, it may perhaps be well to remember that it may not be so great an essential as Sir JOHN BYERS seems to think, seeing that, as the history of Ireland itself demonstrates, relapsing fever and, in large part, typhus fever had well-nigh disappeared from Ireland before notification was in force, a fact which surely points to the conclusion that notification, although important and helpful, is not an absolute essential in the case at least of some diseases—and the past history of tuberculosis lends support to a view that it has certain points of resemblance both to typhus fever and relapsing fever. We are in agreement with Sir JOHN BYERS as to the utility of the notification of pulmonary tuberculosis provided that the knowledge thereby obtained is used for helping the patients rather than, indirectly, to render them marked persons to be avoided by their fellows. But we are not altogether in accord with him as to the desirability, at least in the first instance, of compulsory notification, although we know that he takes a broad view of the matter and discountenances extreme measures, having probably, like so many others who have carefully studied this intricate problem, somewhat modified his original position. As to the forms of tuberculosis which should be notified Sir JOHN BYERS is of opinion that all forms, medical and surgical, should be included, although he would be content for the present if all forms of the pulmonary type were notified, but these he thinks that it should be compulsory to notify. He considers that compulsory notification will lead to the notification of those much desired but frequently elusive cases—the early ones. But we doubt whether the experience of compulsory of the protective power of the blood he would reply that he would prefer to make a complete estimation, but that at the present time it was impossible to do so. The opsonic evaluation of the protective power of the blood fluid was, he frankly confessed, an incomplete evaluation, but as at the present time it was the only possible one to obtain it should certainly be employed. A partial evaluation was of more practical use than none at all. Objections had been raised to the effect that a partial evaluation could not be useful as an index of immunity; its employment was not justifiable. To these objections he replied that if repeated examinations extended over years and made in thousands of cases had shown that a low opsonic power was associated with low resistance to disease, and that there was a definite correlation between high opsonic power and curative processes, the conclusion could certainly be drawn that the opsonic evaluation of the blood was of use for the estimation of protective substances in the blood. The further objections might be raised, and indeed had been raised, that the recorded cases were selected, the failures neglected or forgotten, and that the improvement noticed under vaccine treatment was not real improvement but an improvement apparent only to the sanguine and deluded physician. The only possible answer to such objections was to publish certain cases in which prolonged treatment had been carried out and in which charts had been made showing low opsonic power coinciding with a definite objective sign recognisable to all such as high fever, and high opsonic power coinciding with diminished temperature as well as improvement of the clinical symptoms. Sir Almroth Wright said that he intended very shortly to publish a series of ten charts illustrating these facts. He then passed on to consider the question whether it was necessary in all cases of disease to make an opsonic estimation of the blood before proceeding to treat by vaccines. The difficulty of the process was a barrier to its frequent employment and vaccine therapy would be neglected if its use necessitated an opsonic estimation. Experiments had been made on a large number of people and it had been found that in average cases certain definite doses produced the same results; further experiment had determined the size of the dose required to produce the best possible result in average cases. Thus for ordinary staphylococcal infections a dose could be given without first having recourse to an opsonic estimation. Only in certain rare cases which resisted the average dose was it necessary to undertake the opsonic investigation of the individual and prescribe the necessary dose in accordance with the findings of the opsonic index. Sir Almroth Wright turned to the consideration of a further objection that had been raised. It had been said that the opsonic index could be of no value because patients had died while the index was high. The explanation was, that although the general circulating blood fluid might be highly resistant yet the focus in which the germs dwelt might be inaccessible to the circulating blood. The blood in an abscess might have a very poor resistance and the leucocytes in the abscess might be dead, although the blood in the general circulation of the same patient had high resistive powers in its fluid and its leucocytes might be quite healthy. In chronic sinuses the firm wall prevented fresh blood gaining access to the situation where the germs were pent up. The principle to be learned from this fact was that in treatment *the protective substances in the blood must be brought into effective operation at the site of infection.* The importance of this principle could not be over-estimated in practice. He would conclude this general outline of the theory of vaccine therapy by urging those present to remember the two main principles: (*a*) the necessity of producing the highest possible protective power of the blood by correct vaccine dosage, and (*b*) the necessity of bringing that blood into efficient operation at the site of infection. Sir Almroth Wright next considered the treatment of certain diseases specially affecting the skin. Boils could in most cases be cured quite mechanically by administering the ascertained average doses of staphylococci. A carbuncle was less easy to cure, because the blood could not easily be brought into effective contact with the germs. The best method to favour the blood flow in the carbuncle was to administer citric acid internally, thus diminishing the blood coagulability, and locally to apply a solution of salt and sodium citrate in order to decalcify the lymph. He regretted to say that in his hands Bier's method of inducing local hyperæmia by dry cupping had given no good results. In lupus the crusts should be removed and the lymph flow encouraged by a local dressing with a very dilute solution of salt and citrate of sodium. When the flow of lymph was deemed sufficient it could be checked by rubbing into the part a mixture of chalk and calcium chloride, in the proportion of 1 part of calcium chloride to 399 parts of precipitated chalk. The lymph flow should be induced daily by the above method and at the same time tuberculin injections should be administered. In chronic processes such as tuberculosis the resisting power of the blood should be noted repeatedly and the correct dosage accurately determined. In severe cases of lupus streptococci and staphylococci were usually present and it was essential that treatment should also be directed against those micro-organisms. He had had very unsatisfactory results with the superficial dry lupus, usually known as psoriasis lupus, and for this failure he could at present suggest no adequate explanation. In erysipelas the routine dose was 2,000,000 streptococci administered every four days: the results were remarkably good.

After Professor T. C. GILCHRIST (Baltimore) had moved a vote of thanks to Sir Almroth Wright for his lucid and instructive address,

Professor ARTHUR WHITFIELD (London) asked several questions. Was it a fact that a high opsonic index invariably indicated that a correct dosage had been given? He had seen quite a number of cases of boils in which a dose of vaccine had been given, and although 24 hours later a high opsonic index was present a fresh boil had developed in the intervening period of time. Did not this observation prove that the partial evaluation of the blood indicated by the opsonic index was not always an accurate method of ascertaining the size of the dose of vaccine necessary to induce a protective process? On the other hand, vaccine therapy had fallen into undeserved disrepute from failures in cases where medical men had made mistaken diagnoses and treated rodent ulcers with tuberculin, or streptococcal infections with staphylococcal vaccines. It seemed a simple matter to take a specimen of pus from an ordinary boil and have it examined to discover what micro-organism was in operation, but in less simple cases a lack of knowledge of ordinary bacteriological technique on the part of the medical man in attendance had been the cause of failure to detect the disease-producing organism. If the medical man could not carry out these procedures correctly he had better leave vaccine therapy to more competent hands, or that method of treatment would be still further discredited. With reference to Sir Almroth Wright's solution of salt and citrate of sodium, he had found the solution of value in many cases without any vaccine injections. For example, a chronic callous ulcer of the leg could be softened in a week by such a solution applied from time to time to encourage the flow of lymph. On the other hand, cases such as chronic sycosis, which were so difficult and long-standing when treated by ordinary methods, often cleared up after one vaccine inoculation. Impetigo contagiosa could be cured in two days. The failure of lupus to respond to vaccine treatment was very strange: he had never seen a case benefited by it. After treatment by Finsen light the lupus granulomatous tissue became replaced by a fine soft atrophic scar; but after vaccine treatment he had never seen such a scar. The superficial so-called psoriasis lupus ought to be the easiest form to cure, because it occurred in the papillary layer of the skin which was very vascular and ought readily to be bathed in the highly protective substances of blood raised to a high opsonic index after suitable injections.

Dr. W. M. CROFTON (Sutton Bridge, Lincoln) had worked with vaccine therapy in Ireland for three and a half years. He had also used the anti-bacterial sera, employing small and gradually increasing doses every fourth day. He quoted a serious case of erysipelas which had been practically cured in less than a week. He always started with small doses. As another instance of immunisation on these lines he quoted a case of tuberculous disease of the hip-joint treated by 12 doses of tuberculin R., beginning with 1-10000th of a milligramme and ending with one milligramme. The treatment extended over six months. Not much improvement was noticeable until after the sixth dose. The patient was now quite well and had been so for six months.

Professor GILCHRIST said that at the Johns Hopkins University they were using the vaccine treatment empirically spare rather flaccid muscles, scanty subcutaneous tissue, and pale complexion. He found, moreover, that such individuals possess a labile nervous system, with a tendency to irritability, depression, and hyperæsthesic sensibilities. Finding that these peculiarities were associated with the tendency to various ptoses, to neurasthenia, and the various forms of functional dyspepsia, including Reichmann's disease or hyperchlorhydria, he arrived at the generalisation which we have already summarised. Professor STILLER'S views have been accepted by many German authorities, by some *in toto*, but by others with certain reservations. On the other hand, they have been strenuously opposed by other authorities, notably by GLÉNARD. One of the most interesting chapters in the book is that in which Professor STILLER deals with his critics. He has an incisive, caustic style and an admirable critical faculty. GLÉNARD, while admitting that such a condition of the tenth rib exists in cases of enteroptosis, denies that it is of congenital origin and attributes it to the pressure of corsets or belts. MEINERT has investigated the condition of the tenth rib in 120 patients and in 100 cadavers, and states that unless great care is taken it is easy to mistake the eleventh rib for the tenth. Professor STILLER, however, states that the tip of the tenth rib is almost without exception to be found in the nipple line, whereas the eleventh lies in the mid-axillary line. MEINERT further states that the condition of free tenth rib is rare, a criticism which Professor STILLER meets by maintaining that he has overlooked all but the most pronounced forms of the defect. Examination of the condition of the end of the tenth rib in the post-mortem room by MEINERT, TANDLER, and FELDMANN revealed the interesting fact that the end of the tenth rib cartilage is normally bound to the ninth by a loose ligamentous connexion which permits of a certain amount of movement. Professor STILLER therefore assumes that during life in the normal person movement is prevented by the tense condition of this ligamentous union, whereas in the person of asthenic type it is not so; he also lays stress upon a defect in length of the tenth cartilage as well as upon its mobility. He further states that in marked degrees of the condition the ninth rib may be free and in rare cases the twelfth may be missing.

In discussing the relation of the asthenic constitution to the development of disease it is claimed that this type of organisation strongly predisposes towards pulmonary tuberculosis and chlorosis, and to a lesser degree towards gastric ulcer, achylia, and postural albuminuria. Its relation to pulmonary tuberculosis is very strongly urged; indeed, it is maintained that the supposed typical tuberculous appearance is really that of the asthenic constitution and that the value of the dietetic and hygienic methods of the sanatorium treatment is largely the result of their beneficial effect upon the underlying asthenic habit of body. Professor STILLER'S thesis is one of considerable interest and affords material for much thought and for research. It is developed with great skill and is obviously the outcome of prolonged and detailed observation. If it proves on further investigation by other authorities to be correct it may serve to explain many associations which are at present obscure, such as the frequent association of gastro-intestinal disorders with neurasthenia. It may also prove to be useful in regard to prognosis and treatment and in relation to the scheme of education of those in whom the asthenic constitution is recognised in early life.

The Prevention of Tuberculosis (Ireland) Bill.

THE criticisms which some of the provisions of this Bill have evoked have in their turn given rise to a movement intended to aid the promotion of the measure, and at a meeting in Dublin of the Tuberculosis Exhibition Committee of the Women's National Health Association of Ireland, which was attended by delegates from local authorities, some of the points at issue were discussed at length. The outcome of an animated discussion was, as will be seen in the weekly letter from our Irish correspondents, that the principle of notification was approved of by a nearly unanimous vote; and a speech by Sir JOHN BYERS, which we have been able to peruse at length, had in great probability much to do with this result of the debate. Sir JOHN BYERS, in supporting a motion in favour of the Bill, drew attention to the fact that many persons felt that as it stood the measure needed amendment and strengthening, and while he thought that Mr. BIRRELL would be quite willing to adopt any modifications which were feasible, he regarded notification as absolutely necessary for dealing with the disease, pointing to the history of the Notification Act in support of his statement. Although there is no need to question the value of notification, it may perhaps be well to remember that it may not be so great an essential as Sir JOHN BYERS seems to think, seeing that, as the history of Ireland itself demonstrates, relapsing fever and, in large part, typhus fever had well-nigh disappeared from Ireland before notification was in force, a fact which surely points to the conclusion that notification, although important and helpful, is not an absolute essential in the case at least of some diseases—and the past history of tuberculosis lends support to a view that it has certain points of resemblance both to typhus fever and relapsing fever. We are in agreement with Sir JOHN BYERS as to the utility of the notification of pulmonary tuberculosis provided that the knowledge thereby obtained is used for helping the patients rather than, indirectly, to render them marked persons to be avoided by their fellows. But we are not altogether in accord with him as to the desirability, at least in the first instance, of compulsory notification, although we know that he takes a broad view of the matter and discountenances extreme measures, having probably, like so many others who have carefully studied this intricate problem, somewhat modified his original position. As to the forms of tuberculosis which should be notified Sir JOHN BYERS is of opinion that all forms, medical and surgical, should be included, although he would be content for the present if all forms of the pulmonary type were notified, but these he thinks that it should be compulsory to notify. He considers that compulsory notification will lead to the notification of those much desired but frequently elusive cases—the early ones. But we doubt whether the experience of compulsory white hat had been worn and the eyes had been protected by blue spectacles. In November, 1907, he had seen a woman suffering from extensive lupus vulgaris of the face and neck of 25 years' duration. The patient had been in the habit of wintering in a warm climate and it was decided to spend the winter at Helouan in Egypt. During her residence abroad she was advised to carry out systematic prolonged daily exposure to sun rays. The affection had made its appearance in very early childhood. Both cheeks were affected, the right extensively, and also the submaxillary regions on both sides. A large part of the lesion, however, was cicatrised but the right and left cheeks showed centrally situated typical apple-jelly nodules. Various modes of treatment had been tried, including tuberculin and the Finsen light, but with very unsatisfactory results. The patient had commenced heliotherapy at Helouan about Jan. 1st, 1908, and had discontinued it about May 3rd, 1908, when she had returned to this country. The face had been systematically exposed during these four months to the full blaze of the sun for five hours nearly every day. It had blistered from time to time. The first exposure produced six bullæ on the right cheek. This condition had been anticipated before leaving home and the patient had been instructed to use a lotion containing boric acid, calamine, and zinc oxide. As a protection against the sun the head had been swathed in a cloth and the eyes covered with a dark bandage. During these exposures the patient felt physically and mentally slack. In three weeks' time improvement had been recorded. The patient had been seen the day after her return to Scotland and careful examination had failed to discover any apple-jelly nodules, but there remained one or two faintly hyperæmic macules. The quality of the cicatrices was excellent. The general health had greatly improved and the mental attitude was eminently bright and cheerful. This result was very striking, especially when it was remembered that it had taken place in the relatively brief period of four months and had been instituted merely upon the principle of making the best use of available therapeutic measures while wintering abroad.

ELECTRICAL MEDICINE.

THURSDAY, JULY 30TH.

The proceedings were opened by Dr. H. LEWIS JONES (London) who read a paper to introduce a discussion on

Interrupted Currents in Medical Practice.

In his opinion there was a tendency in modern electrotherapeutics to get away from ordinary galvanisation and faradisation, especially in the treatment of muscular weakness, paralysis, and wasting, and to use in place of these currents which vary their magnitude and even direction in a regular rhythmic manner. The rhythmic interrupter worked by a metronome was a very efficient one and deservedly popular. He described a new apparatus by Gaiffe in which static currents were caused to vary in a rhythmic manner. The contractions were certainly not unpleasant but the apparatus was not very suitable for everyday work. For the painless currents, so suitable for testing, he thought the Leduc commutator preferable to the coil as a rule. He considered carefully wound induction coils of small size and having small iron cores to be the best, but if a large coil were used a very short spark gap should be placed in series with the secondary. This allowed only a part of the bigger waves to get through, so that the resulting current was a series of steep but short unidirectional impulses which were *found to have little or no stimulating* action on the sensory nerves.

Mr. W. DEANE BUTCHER (London) concurred in the value of rhythmically varying currents. He mentioned the importance of avoiding unequal pressure of the electrodes, which might cause objectionable results, and admired the use of the "chain-mail" electrodes which adapted themselves very readily to the configuration of the parts. He also drew attention to the fact that main currents were as a rule more painful than the current from batteries and were quite unsuitable for the production of electro-narcosis or any experiments of a more or less delicate nature.

Dr. WILFRED HARRIS (London) spoke of the good results which he had obtained in spastic paralysis by the use of the sinusoidal current administered in a full bath. He also confessed to a partiality for the combined galvano-faradic current which had done good service in his hands. At St. Mary's Hospital his rule was to treat the patients in series with each other.

Brief comments regarding their own practice were made by Dr. DAWSON TURNER (Edinburgh), Mr. G. H. THOMPSON (Buxton), and Dr. A. H. PIRIE (London).

The PRESIDENT of the section (Dr. E. REGINALD MORTON, London), after thanking Dr. Lewis Jones and those who had contributed to the discussion, stated that he had been so impressed with the value of a slowly varying current that he had been using it to the exclusion of almost every other for the past three years. He had settled upon a slow sinusoidal current chiefly for the reason that its generation presented no great difficulty and the generator would require less attention than any other apparatus which he knew of. He treated his hospital patients in parallel from shunt resistances, as this gave one the means to vary the strength of the current to individual cases. The periodicity of the current varied at times from one to two cycles per second. With regard to painless currents for testing he confessed that the Leduc commutator so modified as to give reversals of current had *not quite come up to expectations, but so far* as he had gone he thought that the best results were obtained when the moveable brush was adjusted to give very short impulses at the rate of from 400 to 600 per second. He still hoped that a satisfactorily painless current would be obtained in this way, possessing *as it did so many advantages over coil* currents.

Dr. LEWIS JONES replied.

Dr. DAWSON TURNER read a paper entitled

The Hæmo-renal Index.

The H.R. index, he said, was the ratio of the electrical resistance of the blood to the electrical resistance of the urine.

$$\frac{\text{Electrical resistance of the blood}}{\text{Electrical resistance of the urine}} = \text{H.R. index.}$$

This would be equal in health to three, four, or five whole numbers—e.g., $\frac{900}{225} = 4$ or $\frac{1000}{250} = 4$. The higher the index was the healthier, other things being equal, was the condition of the patient. If the index increased it indicated that the blood contained fewer salts or was richer in corpuscles, and that the urine contained more salts and that the functional activity of the kidney was increasing; if the renal index diminished then the kidney was becoming sluggish and less efficient. An index below 3 was abnormal and suspicious and an index below 2 was serious. Surgical interference in kidney lesions was contraindicated if the index was much below 3. The method was of value in surgical affections of the kidney where one kidney was chiefly affected and where there was a question of its removal; it afforded a means of testing the renal capacity so far as regards the elimination of salts and it was another attempt to apply precise scientific measurement to clinical medicine and surgery. He cited cases illustrating the value of the method as an aid in diagnosis and in directing future treatment.

The paper aroused considerable interest and in reply to questions asked in the course of the discussion, in which Dr. LEWIS JONES, Dr. HARRIS, Dr. PIRIE, Dr. J. A. MACDONALD (Taunton), and the PRESIDENT of the section took part.

Dr. DAWSON TURNER said that the resistance varied very little from hour to hour in any given patient or healthy individual; that the proportion of urea present seemed to have very little influence on the electrical resistance—a point, among others, which he had determined by the examination of a large number of artificial urines—and that sodium chloride was the only constituent that really mattered.

The PRESIDENT of the section in the course of his remarks congratulated Dr. Dawson Turner on the large amount of work which he had done to place the matter on a satisfactory basis and was convinced that the method would become a recognised one in the clinical diagnosis of renal inefficiency.

Mr. DEANE BUTCHER read a paper on

The Therapeutic Action of Radium,

in which he wished to lay stress on its great value in cases of pruritus. He cited cases in which it had proved successful after all other methods had failed, including the x rays. He also gave evidence of its value in birth-marks and rodent ulcer. It was a curious fact that what had been found to be a sufficient dose when applied to tissues had no effect on a the American Indians who regarded it as a specific for sore and inflamed eyes. It was a very popular remedy for this affection with the pioneers in Ohio and Kentucky, who also chewed the root for the relief of soreness of the mouth. Burton, in his "Collections for an Essay towards a Materia Medica of the United States" (1804), refers to the use of a spirituous infusion of the root of golden seal as a tonic bitter and of an infusion of the root in cold water as a lotion for inflammation of the eyes. According to Dr. C. S. Raffinesque, in his "Medical Flora" (1828), the Indians employed the juice or infusion "for many external complaints as a topical tonic," and "some Indians employ it as a diuretic, stimulant, and escharotic, using the powder for blistering and the infusion for the dropsy." He further states that "internally it is used as a bitter tonic, in infusion or tincture, in disorders of the stomach, the liver, &c." About the year 1847 a demand was created for golden seal by practitioners of the eclectic school. It then became an article of commerce and the price soon rose from a few cents a pound to upwards of two dollars a pound. The root was made official in the 1860 edition of the United States Pharmacopœia and has remained official to the present day. It did not appear in the British Pharmacopœia until the issue of the Addendum to the 1885 edition. The wide popularity of the drug at the present day is evidenced by the fact that from 200,000 to 300,000 pounds of the dried root are sold annually. Formerly the drug was entirely collected in the woods by drug diggers, but within the past few years their depredations and the more extended cultivation of land in the United States have been the chief factors in inducing cultivators to pay attention to the growing of golden seal. It is satisfactory to learn that the cultivated roots are even richer than the wild roots in hydrastine, the chief active constituent of the plant. About nine-tenths of the supply of golden seal is used in the United States, chiefly in utero-ovarian disorders. Its remedial action in such cases is ascribed to the hydrastine, while berberine, the other important constituent, is valuable simply as a bitter tonic.

THE DECLINING ENGLISH DEATH-RATE.

THE rate of mortality in England and Wales during last year did not exceed 15·0 per 1000 of the estimated population; it was 1·7 below the mean annual rate during the ten years 1897–1906, and was distinctly lower than the rate recorded in any year for which trustworthy statistics exist. The Registrar-General's returns for the first two quarters of 1908 show, moreover, that the death-rate had further declined considerably below the low rate in 1907. In the first quarter of this year the annual death-rate was 1·0 and in the second quarter 0·8 per 1000 below the rates that prevailed in the corresponding quarters of last year. The mean annual rate during the first six months of this year did not exceed 15·8 per 1000, and was 1·3 below the mean rate in the corresponding period of the ten years 1897–1906. It appears from the last quarterly return recently issued that during the three months ending with June last the crude death-rate in the 76 largest English towns did not exceed 13·7 per 1000, against 14·7, 14·8, and 14·9 in the three preceding corresponding quarters. Thus the crude death-rate in these large towns was 1·1 per 1000 below the mean rate in the same towns during the three preceding corresponding quarters and was slightly below the recorded rate in the whole population of England and Wales. After correction, however, for differences in the age and sex constitution of their population the death-rate in these towns during last quarter is raised to 14·6 for true comparison with the rate of 13·7 in the whole of England and Wales; the corrected rate in 142 smaller towns last quarter was equal to 13·5, and in the remainder of England and Wales (excluding the 218 towns) was 13·3 per 1000. The rate of mortality from the principal epidemic diseases in England and Wales last quarter did not exceed 0·94 per 1000, against 1·48, the mean rate in the three preceding corresponding quarters. The death-rates last quarter from measles, scarlet fever, diphtheria, whooping-cough, and fever (principally enteric) were all considerably below the rates from these diseases in the corresponding quarter of last year. Another eminently satisfactory feature in the mortality statistics for last quarter is a marked further decline in the death-rate of infants under one year of age, which did not exceed 97 per 1000 births registered, against 112, 108, and 110 per 1000 respectively in the corresponding quarters of 1905, 1906, and 1907. In the 76 large towns the mean rate of infant mortality was equal to 100 per 1000 births, and ranged from 46 in Hornsey, 52 in Handsworth, and 70 in Tottenham, to 141 in Rhondda, 160 in Hanley, and 167 in Burnley. The excess of the rates of infant mortality in the Lancashire, as compared with the Yorkshire, towns is again very noticeable, and among the smaller Lancashire towns the rates were equal to 147 per 1000 in Colne, 154 in Darwen, and 172 in Ashton-under-Lyne; whereas, on the other hand, the rates did not exceed 73 in York, 75 in Halifax, 78 in Huddersfield, and 92 in Keighley. It is, moreover, satisfactory to note that the proportion of uncertified causes of death in England and Wales continues to decline. During the second quarter of this year the proportion of uncertified causes of death in England and Wales was equal to 1·4 per cent. of the registered deaths, whereas in the ten preceding corresponding quarters the mean percentage was 1·7. Among the 76 large towns the proportion of uncertified causes of death did not exceed 1·0 per cent. Whereas all the causes of death were duly certified in West Ham, Croydon, Walthamstow, Brighton, Derby, and in ten other smaller towns, the proportion of uncertified deaths ranged upwards in the remainder of the 76 towns to 3·8 per cent. in Birmingham, 4·4 in King's Norton, 6·3 in Warrington, and 7·6 in Gateshead. It would be interesting to have an explanation of the excessive proportions of uncertified deaths in these last-mentioned towns. Is it due to the practice of unregistered medical practitioners or to the neglect to provide any medical attendance during the last illness of the deceased? In either case, however, this defect in the Death Register might be obviated by action on the part of the local coroners. It should further be noted that as the result of the action of the metropolitan coroners the causes of all but 11 of the 15,196 deaths registered in London during last quarter were duly certified.

THE DEATH OF PROFESSOR HENRI BECQUEREL.

A BRILLIANT investigator is lost to the scientific world in the person of Professor Henri Becquerel whose death in Brittany was announced last week. The fact that at the time of his death he was president of the Paris Academy of Sciences is proof of the high esteem in which Professor Becquerel was held by his distinguished scientific colleagues in France. Professor Becquerel's researches on phosphorescence paved the way to the discovery of radio-activity and of the existence of radium in pitchblende as a definite entity by Madame Curie. He obtained impressions on photographic plates wrapped in black paper and exposed to the uranium salts, and proved that this did not necessarily depend upon the exposure of these salts to light in the first instance, or upon their power of absorbing rays and afterwards giving them out, but on their power spontaneously to emit radiations. Professor Becquerel showed that these rays, no retarding action on the progress of the meal through the intestine. Another noteworthy statement by Mr. Thurstan Holland was that as a result of examining a large number of normal and (suspectedly) abnormal stomachs in various positions in this way he had come to the conclusion that not only was the shape of the stomach as given in the text-books a wrong one, but that there was really no true and fixed normal shape of stomach. He considered the use of a bougie loaded with mercury for locating obstructions in the œsophagus to be a distinctly dangerous one and that it did not possess any advantages over the bismuth emulsion which was perfectly safe.

Dr. A. E. Barclay (Manchester) continued the subject, showing a number of slides and diagrams of cases that had been examined by this method. He also showed that percussion was of very little value in determining the size and shape of the stomach. He considered the use of bismuth carbonate to be perfectly safe in spite of the dangers ascribed to it so long as the pure carbonate was used, and he agreed with Mr. Thurstan Holland as to the danger of using the mercurial bougie.

Dr. A. F. Hertz (London) considered that the oxychloride of bismuth was the most suitable salt to use in these examinations for the reason that it was chemically inert in the digestive canal. The carbonate had a neutralising effect upon the stomach contents and would in that way interfere with its normal movements. It was his practice to give two ounces of bismuth mixed with an ordinary meal such as porridge, or bread-and-milk, rather than suspended in mucilage. There was a tendency for the bismuth to stick to the mucous membrane after the main portion had passed on and this was a likely source of error, but not so likely if the bismuth was mixed with food.

Dr. C. Lester Leonard (Philadelphia) showed some lantern slides bearing on this question and took occasion to point out the great value of instantaneous radiography. He showed a radiogram of the stomach in which a fine peristalsis could be seen travelling down the greater curvature of the stomach. This, of course, would have been completely lost in an exposure lasting more than one or two seconds.

The President of the section considered that those present had listened to a very interesting and important discussion. Looking over the work of the section it was easily seen that medical radiography predominated and some of those present might remember that it was freely said and thought that the usefulness of x rays would be more or less limited to surgical cases. Speaking generally, it was more difficult to give diagnostic assistance in medical cases, but the great advances made during the last few years afforded eloquent testimony to the value of the work done. While in pulmonary disease radiography might be able to show very little that could not be discovered by an expert in physical diagnosis, still its value as a corroborative was immense. With regard to the present discussion he did not think anyone would be so rash as to say radiography had not really found out something quite new. It was an important feature of the study of gastric conditions by bismuth and the x rays that the shape and position of the stomach as they were taught to regard it were quite fallacious and that they must now remember that the stomach was a very mobile and elastic organ, having no fixed form or position even under normal conditions. He wished to congratulate Mr. Thurstan Holland, Dr. Barclay, Dr. Leonard, and the others who had taken part in the discussion on the valuable work which they had done. In this class of work he was sure that radiographers would find great assistance from instantaneous and tele-radiography. As in ordinary photography so also in radiography would they find that the rapid exposure would ultimately prevail.

Mr. Thurstan Holland, in his reply, did not agree with Dr. Hertz as to the bismuth sticking to the mucous membrane being a source of error. The amount would be so small that it could not deceive anyone of even limited experience.

Dr. W. Ironside Bruce (London) described

A New Method for the Localisation of Foreign Bodies.

A special apparatus which he had designed was shown and the method of using it was explained. The foreign body having been localised, the same apparatus was again placed in position when the patient was on the operation table and under the anæsthetic and then a needle was passed down and into the flesh, the point coming to rest at the foreign body which it was desired to remove.

Mr. J. Hall-Edwards (Birmingham) read a paper on

X Ray Dermatitis.

This was a very complete and exhaustive treatise on the subject and dealt with as no other person could do in view of the unusual amount of suffering and mutilation which he had himself endured. The paper was illustrated with skiagrams and coloured drawings and coloured photographs by the Lumière autochrome method. It was unfortunate that through lack of time Mr. Hall-Edwards had to abbreviate his paper in the reading.

The President of the section expressed his thanks and indebtedness to Mr. Hall-Edwards for preparing such an excellent paper.

The proceedings of the section terminated with a vote of thanks to the President and to the local honorary secretary (Dr. A. Rupert Hallam, Sheffield) who had made such excellent arrangements for the comfort and convenience of the section.

LARYNGOLOGY, OTOLOGY, AND RHINOLOGY.

Thursday, July 30th.

Mr. George Wilkinson (Sheffield), President of the section, occupied the chair during part of the proceedings, and subsequently Dr. W. Jobson Horne (London), one of the Vice-Presidents, was chairman.

Mr. C. A. Ballance (London) and Dr. A. L. Whitehead (Leeds) opened a discussion on

The Diagnosis of the Intracranial Complications of Middle-ear Suppuration.

Mr. Ballance, in his opening statement, touched upon the cardinal symptoms of (*a*) dural inflammation and extradural abscess; (*b*) venous infection; (*c*) meningitis; and (*d*) brain abscess. In extradural abscess and parasinus abscess there were headache at the site and tenderness. In venous infection fever was constant and high. In meningitis lumbar puncture was of service, both for diagnosis and treatment; negative evidence as regards bacteria and cells was of no value. Four-fifths of the cases of otitic brain abscess were associated with chronic ear disease; in one-fifth of such cases the ear disease was acute. Two instances out of three were not complicated with other intracranial lesions. He next considered the question of the existence or otherwise of an otitic intracranial complication: (*a*) in patients who were obviously seriously ill; and (*b*) in patients who complained of ear disease but who were not obviously seriously ill. In those that were obviously ill the onset was often said to be sudden and at times there was no suppuration; external mastoid signs might be absent. In those who complained of ear disease but who were not obviously seriously ill, death might be hastened by the lack of operation or by an operation limited to the mastoid. Vaccine treatment was most valuable. Speaking of the symptoms associated with labyrinthine suppuration, Mr. Ballance said that investigation of the labyrinth was only possible after the mastoid operation. Some special difficulties in connexion with the diagnosis of intracranial complications of middle-ear suppuration were next considered. Amongst these were mentioned complications arising from concurrent typhoid fever or acute specific disease or illness occurring in the same house; also old ear disease rekindled by septic infection elsewhere, so that the ear became a secondary seat of infection. In conclusion, attention was drawn to the indications afforded by certain modern methods of investigation, and more particularly to the value of leucocytosis.

Dr. Whitehead, in his opening statement, discussed the indications of dural inflammation and extradural abscess. In the former there was commonly persistent headache. A profuse discharge out of proportion to the middle ear was suggestive of an abscess. Vomiting might be absent except in children. He mentioned the relative frequency of optic neuritis in the different forms of intracranial complications. Lumbar puncture he considered more confirmatory than diagnostic. In temporo-sphenoidal abscess the loss of power of naming objects was a valuable differential sign. In cerebellar abscess nystagmus was more frequent than was commonly thought. The rotation of the arm and forearm was difficult in cerebellar abscess. In children typhoid fever, followed by otitis and protracted convalescence, might be the physician and for suggestions for treatment in the school. With very few exceptions it has been found that the parents have carried out the suggestions of the physician. The data derived from a physical examination are generally of direct benefit to the pupil by revealing the presence of disease in its early stages and so increasing the chances of a permanent cure. The teacher, too, finds the reports of value, frequently enabling him to trace mental deficiencies to a physical cause. At Halle the school physician has been greatly helped by various specialists who unselfishly placed their knowledge at the disposal of the authorities in stubborn and unusual cases. In many cases the removal of swollen tonsils or adenoids, which contribute to the languor and dulness of a child, may relieve headache, nasal speech, or deafness, as well as unwillingness or inability to follow the school work. Since the auxiliary school physician most frequently meets with nervous diseases, from abnormal excitability to the most serious phases of brain troubles, it is highly necessary for him to be well versed in neurology. At Halle much assistance was rendered by a university professor who consented to treat children affected with paralysis, epilepsy, or St. Vitus's dance. In addition to his many-sided professional assistance the physician is helpful to the auxiliary schools in other ways. He may prevent wrong ways of treating children in the home and give advice when improper food is provided. He may make the pupil's school work easier in various ways, particularly in helping to form vacation colonies in the woods and other suitable places. While the authorities prefer to intrust the work only to a physician who is interested in school hygiene and child-study, it is often very hard to find an experienced physician who is willing to undertake the work. Consequently the auxiliary school physicians in Germany are mostly young men. In addition to a knowledge of school hygiene the auxiliary school physician finds it advantageous to be familiar with psychology and psychiatry. The ideal school physician realises that the highest aim of education is to better the physical as well as the mental condition of the pupils, and he coöperates with the teacher in the attainment of this aim. Thus he may advise the teacher with regard to the length of recitations, the number of intermissions, and the order of subjects in the daily programme. The bulletin contains a number of forms of health reports and is of interest to physicians connected with schools, particularly schools for those who are mentally deficient.

MUSSELS AND TYPHOID FEVER.

AN interesting and instructive preliminary report upon the relationship of mussels to typhoid fever has recently been presented to the health committee by the medical officer of health of Birmingham (Dr. John Robertson). The report has been prepared by the assistant medical officer, Dr. G. F. Buchan, and though it is not conclusive it points to definite and serious sewage contamination of a much-eaten shell-fish, and it suggests that certain standards of purity should be established and that the sale of mussels falling below the standard should be prohibited. During the past four years 74 cases of typhoid fever have been recorded in Birmingham in which the patient had eaten mussels within four weeks of the commencement of the symptoms of the disease. The source of the mussels eaten by the patients could not be traced except in one case, but the number of cases pointed to the necessity for an inquiry into the general bacteriological condition of the mussels delivered to the Birmingham market. Mussels from 15 known sources were examined and evidences of definite sewage contamination were found. The data sought for were the total number of micro-organisms present in one mussel and the number of the following organisms: bacillus coli communis, bacillus enteritidis sporogenes, streptococcus, and bacillus typhosus. Bacillus typhosus is the only one of the four which causes typhoid fever and it was the only one not found in any of the specimens examined, but the other bacilli and the streptococci, which are accepted as criteria of pollution, were present in greater or smaller numbers, indicating a contamination of the sources from which the shell-fish were derived pregnant with danger which may spring into active life at any moment. In the circumstances it is clear that if a bacteriological standard could be fixed to indicate the boundary line between the mussels which might be considered as comparatively safe and those which should be condemned as food a great advance would be made, and the health authorities would be provided with data which would facilitate their attempts to force the owners of mussel beds to take proper precautions. Dr. Buchan suggests the following standards as indicating that the contamination is so great that the shell-fish reaching or passing them should be condemned as unfit for food. As regards the total number of organisms present, 1,000,000,000 per mussel either by gelatin or agar count. As regards special organisms, more than 1000 spores per mussel of bacillus enteritidis sporogenes, more than 10,000 streptococci per mussel, more than 1000 "coli" organisms of 5¾ or 5½ value, and more than 10,000 "coli" organisms of 5 value, the value of the "coli" organisms being estimated by their powers of fermenting glucose and lactose, of producing indol and fluorescence, and their action upon saccharose. If these standards were applied in Birmingham then five of the sources from which the 25 samples were obtained would be condemned.

"PIGEON DIPHTHERIA."

THE results of a collective inquiry into the 1907 epidemic of so-called "diphtheria" in wood pigeons, organised by *British Birds* under the direction of Mr. C. B. Ticehurst, M.R.C.S., L.R.C.P., have recently appeared in the pages of that magazine, and will, no doubt, awaken fresh interest in the disease. Though the epidemic in question was practically restricted to migratory flocks frequenting the beech woods of the Thames valley, still it reached such proportions that one spot is mentioned, on the borders of the three counties Bucks, Berks, and Oxon, where more than 4000 diseased pigeons had to be disposed of. On the other hand, a spot map of England which accompanies the report shows that the disease has a widespread distribution, for sporadic cases are reported from Cumberland, Yorkshire, Norfolk, and Essex—Scotland, Wales, and Ireland, however, appear to be exempt; and none of the evidence collected affords any support to Dr L. W. Sambon's suggestion[1] of an intimate association between pigeon "diphtheria" and diphtheria in the human subject. The lesions observed in the diseased birds during life and post mortem are fully dealt with, but the chief interest attaches to the bacillus isolated from these lesions, which Mr. Ticehurst has satisfied himself by inoculation experiments on a wild wood pigeon and a blue racer respectively is the causative factor in the disease. This bacillus agrees more closely with the bacillus diphtheriæ columbarum than the one which is so frequently found in these epidemics and which has a closer relationship to the bacillus of hæmorrhagic septicæmia; and it is a significant fact that this particular epidemic investigated by *British Birds* does not appear to have spread to pheasants and partridges or to mammals. In his report Mr. Ticehurst assumes that the mucous membrane of the fauces and hard palate is the site of infection, and suggests that the probable methods by which tightening the strips the lower needle carrying the depressed structures before it, was lifted upwards and forwards, thus rectifying the deformity. Some local swelling of the parts resulted but no constitutional disturbance. The child, who was a good little patient, suffered no after-pain and appeared quite happy and contented during the ten days in which the needles remained *in situ*. On removing the needles it was seen that small pressure ulcers had formed at the sides of the nose where the tightened gauze had been in contact with the skin; these, however, healed in a few days. Six months had elapsed since the operation and the nose so far had maintained its shape. Whether the nose would continue to grow in the way that it should grow was, however, a question which only the future could determine. The reason of the failure in the previous cases was due to inability to maintain the corrected position of the parts until fixed by the process of healing.

---

[1] THE LANCET, April 18th, 1908, p. 1143.

FRIDAY, JULY 31ST.

Dr. **STCLAIR THOMSON** opened a discussion on

The Methods of Dealing with Suppuration in the Maxillary Sinus,

with a paper of which the following is an abstract.

The methods available are: (1) spontaneous resolution, aided by general hygiene, the administration of drugs, topical applications, and the extraction of teeth; (2) nasal lavage (*a*) through the ostium maxillare, or (*b*) through the antro-nasal wall; (3) buccal lavage (*a*) through the canine fossa, or (*b*) through a tooth socket; and (4) *operations* through the antral walls (*a*) by an opening through the canine fossa only (Desault's or Küster's operation), (*b*) by an opening through the canine fossa and a second opening through the antro-nasal wall (Caldwell-Luc operation), (*c*) the Caldwell-Luc operation, as modified by Denker and by Boenninghaus, and (*d*) by an opening through the antro-nasal wall only (proposed by Mikulicz and Krause, and further developed by Claoué, Réthi, and others). The selection of the most suitable method will depend on whether the suppuration is (1) acute and recent; (2) uncomplicated and chronic; or (3) complicated with suppuration in other cavities. 1. An acute sinusitis may last several weeks and resolve without operation. Or it may become subacute and take six months before disappearing without surgical interference. 2. As regards an uncomplicated, chronic, maxillary sinusitis, it will have to be considered whether the classification of Lermoyez into (*a*) chronic empyema, and (*b*) chronic sinusitis, is always available and how it influences treatment. Mahu's method of gauging the capacity of the affected sinus and thus forming a conclusion as to the condition of its mucosa might also be debated. 3. When complicated with suppuration in other cavities, the first point to be decided, if possible, is whether the maxillary sinus is simply a receptacle for pus secreted elsewhere. The next point is the order in which the sinuses should be operated on when they cannot all be treated at one sitting. Conclusions: 1. In cases which come under observation while in the acute or subacute stage, spontaneous resolution may be expected. If cure is delayed puncture and lavage through the antro-nasal wall are indicated. If a suitable tooth socket is available, lavage through the alveolar border might be employed instead. All suspected teeth should be removed. 2. In chronic, uncomplicated maxillary sinusitis the best hope of complete cure is effected by the Caldwell-Luc operation. The intra-nasal route requires full consideration and discussion is invited on its indications, methods, and results. Permanent lavage through the alveolus is reserved for patients where more radical measures are objected to and when age or health does not permit them. The drawbacks of this method must not be forgotten. 3. In complicated cases a complete diagnosis should be formed before starting surgical measures. Alveolar drainage, when available, should first be instituted, both to facilitate diagnosis and to diminish the septic intensity of the retained contents. The ethmoid next demands treatment and the sphenoidal orifice should be enlarged. A frontal sinus operation should take precedence of the maxillary. If the latter is being drained through a tooth socket the radical operation can be deferred until (by progress) it is determined that the antrum is really diseased and not simply a reservoir. If alveolar drainage is not available then an intra-nasal opening should be made at the time of the frontal operation. A sound tooth should never be sacrificed, as the curative effect of alveolar drainage is uncertain. Free drainage being of prime importance plugs should be avoided.

Dr. **LOGAN TURNER** submitted the following proposition for consideration. Could any assistance regarding the best method of procedure be derived from a study of any one or any combination of the following points: (1) the age of the patient; (2) the duration of the discharge from the sinus; (3) the presence or absence of nasal polypi; (4) the etiology of the condition, nasal or dental infection; (5) transillumination of the sinuses; (6) cytology of the discharge; and (7) the bacteriology of the discharge. If treatment by lavage were decided upon did the nasal or buccal route give the better result? Dr. Turner then considered in detail the foregoing points. 1. As regards age, the older cases were cured just as well as the younger by lavage. Age made no difference but lavage was preferred in old people. 2. Recent cases he regarded as those under one year's standing and 84 per cent. of the cases in his series had been cured by lavage. Cases in which the discharge from the sinus had extended over one year he regarded as chronic. 8 per cent. of the latter cases that had come under his care had been cured by lavage. 3. As regards the presence or absence of nasal polypi, out of 180 cases only 18 had polypi; of these 18, 15 were treated by lavage and 10 were cured. In 19 cases with no polypi lavage had failed to effect a cure. The presence of polypi was generally evidence of some other sinus being affected. 4. As regards the etiology of the condition, out of 180 cases the etiology was definite in 117. As regards the question of nasal or dental infection, bad teeth were not to be readily accepted as the cause. Passing to the cytology and the bacteriology of the discharge, the pus was examined cytologically in 25 cases and bacteriologically in 62. In recent cases staphylococci were found in 72 per cent. and streptococci in 21 per cent. In chronic cases lymphocytes and myelocytes were looked for; the latter were not found, probably on account of there being not much bone affection. The more advanced changes in the epithelium lining the antrum occurred in the lower part, the ciliated epithelium might still be present in the upper part, as was found in a case after six years' duration of the discharge. The presence of streptococci and squamous cells indicated that the radical operation was called for, whilst the presence of staphylococci indicated that lavage might suffice.

Mr. **HERBERT TILLEY** (London) said that lavage in the acute stage relieved the pain and the case got better more quickly. He advocated the removal of the anterior third of the inferior turbinate body in the radical operation.

Mr. **C. A. PARKER** (London) was in favour of the performance of the intra-nasal operation in the first instance. It was free from the slight risk of the Caldwell-Luc operation, and if it did not suffice then the latter could be proceeded with.

Mr. **R. H. WOODS** (Dublin) considered that the inferior turbinate body of the nose was treated with too little respect in operations for the relief of suppuration in the antrum; it was removed too often.

Dr. **DAN MACKENZIE** (London) was against alveolar puncture and was in favour of the intra-nasal operation and of the use of a larger intra-nasal tube.

Dr. **WATSON WILLIAMS** spoke in favour of the Caldwell-Luc operation through the canine fossa as more reliable than the intra-nasal methods.

Dr. **N. C. HARING** (Manchester) remarked that the latent cases were dark to transillumination after the operation. He was against the intra-nasal operation.

Mr. **STUART-LOW** spoke of the regeneration of the mucous membrane lining the antrum.

Mr. **GEORGE JACKSON** (Plymouth) referred to the presence of polypi and the importance of treating caries of the ethmoid. If omitted, recurrence was liable to take place.

Dr. **JOBSON HORNE** (London) attributed the divergence of opinions as to lines of treatment to a lack of knowledge of the etiology. He expressed his thanks to Dr. Logan Turner for his paper which had gone in the right direction to supply that knowledge. Dr. Horne referred to some researches which he made into the bacteriology of the disease some ten years previously, the results of which practically coincided with those of Dr. Logan Turner. Incidentally he mentioned that some of the organisms referred to were not uncommonly peroneal tendons. Lipoma of the peroneal tendon sheaths was diagnosed. There were also flatness of the anterior arch of the foot and hammer toe. An incision three inches long was made from below the external malleolus along the course of the peroneal tendons. The tendon of the peroneus longus presented three cauliflower-like growths, each of the size of a small pea, occupying about an inch of the external surface of the tendon. Between these the surface of the tendon was roughened. A section of the tendon including the growths was excised. Extending the opening in the tendon sheath behind the malleolus a growth resembling a fibro-lipoma presented. This extended about two inches along the tendon and was connected with the sheath. It was also excised. The tendon sheath was closed by continuous catgut suture. Convalescence was uneventful except for slight pain. The patient was allowed to walk on the tenth day and felt some pain about the external malleolus and up the calf, which was relieved by massage and hydrotherapy. Microscopic examination showed that the tumours consisted of adipose tissue crossed by broad bands of cellular connective tissue in which ramified large numbers of injected vessels. The surface of the tumours was completely invested by an extremely vascular layer of this tissue. The vessels as a whole were larger than capillaries and in places showed dilatation into cavernous spaces with irregular contour. None of the vessels had a muscular coat, and for the most part the wall consisted only of an endothelial layer. The arteries of the growths were abundant, of large size, and normal. Lipoma with telangiectasis was diagnosed. The growth connected with the tendon sheath was not microscopically examined but appeared to be a fibro-lipoma. Only two similar cases appear to have been reported, both by Professor Pets Leusden. Both occurred on the tendon of the flexor longus pollicis—one in a girl aged four years, the other in a boy aged two years. Pain on snapping the fingers called attention to the condition. The thumbs were flexed at the interphalangeal joint and could not be fully extended. On passive extension a nodule was felt over the tendon of the flexor longus pollicis. The nodules were removed and showed proliferation with branching of the blood-vessels and considerable thickening of the media of some of them. In his own case Dr. Legg does not believe that the growths removed were true lipomata. He thinks that they were due to tearing of the tendon in the injury five years previously, during the healing of which an inflammatory lipoma from metaplasia formed, subsequently degenerating telangiectatically.

THE friends of the late Dr. Edith Pechey-Phipson having expressed a desire to raise some tribute to her memory a committee has been formed to carry out the two following objects: 1. The foundation of a post-graduate scholarship, to be held by a medical woman, who comes from India or who proposes to work in India; post-graduate study to be carried on in any place or any country approved by the trustees. 2. The building and endowment of one or more additional bungalows at the Nasik sanatorium for women and children. Donations should be sent to the honorary treasurer, Sir Montagu Turner, Chartered Bank of India, Hatton-court, Threadneedle-street, London, E.C.

THE medical session at the University of Manchester will be inaugurated by an address delivered on Oct. 1st, at 4.30 P.M., by Sir Thomas Clifford Allbutt, K.C.B., M.A., M.D. Cantab., D.Sc., LL.D., F.R.S., Regius professor of physic, University of Cambridge.

A White Paper was issued on Monday last, August 31st, containing a supplementary circular by the Board of Educ tion offering to local education authorities explanations questions in connexion with the Education (Administrati Provision) Act, 1907, and with the Code of Regulations f Public Elementary Schools, 1908.

Dr. Ziemann, a German naval surgeon of high rank wh also has the title of Professor in the University of Berli has been appointed head of the Medical and Sanita Department in the Cameroons.

Professor Robert Koch has been appointed by the Germa Government to attend the International Tuberculosis Co gress at Washington as its representative.

THERE is general ground for satisfaction in the report f the year 1907 which has just been issued from the Arm Medical Department.

POST-GRADUATE STUDY.

POST-GRADUATE study is divided into three main divisio —the general study of professional subjects (including th special study of some branch), the study of state medicine, and the study of tropical medicine. We have alread described in the Students' number of THE LANCET, published on August 29th, 1908, the provision made fo instructing graduates in the last two divisions, mentionin the procedure necessary to obtain diplomas or certificates fo proficiency in them. The following article shows th principal arrangements existing for general post-graduat instruction, and some little repetition has been necessary:—

LONDON.

The London Post-Graduate Association.—The London Post-Graduate Association is now so well known that it is hardl necessary to remind our readers that it is composed of the following hospitals and medical schools (general and special)—viz.: *General Hospitals:* Charing Cross, Guy's, King's College, St. Mary's, St. Thomas's, University College, and Westminster. *Special Hospitals:* The Brompton Hospital for Consumption and Diseases of the Chest, the Hospital for Sick Children (Great Ormond-street), the London School of Tropical Medicine, the National Hospital for the Paralysed and Epileptic (Queen-square), and the Royal London Ophthalmic Hospital, late Moorfields (City-road). One ticket (the charge for which is 10 guineas for a three months' course, or 15 guineas for six months) admits the holder to the clinical instruction in the wards and out-patients' departments, the operations, necropsies, and other hospital practice of all the institutions mentioned above. The holder is also entitled to attend any special post-graduate classes which may be held from time to time at any of the general hospitals named so that he need not be unable to keep himself apace with modern advances. For the purpose of enabling qualified medical men to keep up to date in their work we can heartily recommend the scheme offered by the London Post-Graduate Association, which thus places the best of all the hospital work in London at the disposal of its ticket-holders. The office of the association remains as before at the Examination Hall. Further particulars may be obtained by writing to the Secretary, the London Post-Graduate Association, Examination Hall, Victoria Embankment, London, W.C., or by personal application between the hours of 11.30 A.M. and 1 P.M., and 2 P.M. and 3 P.M. any week-day except Saturday.

Medical Graduates' College and Polyclinic.—This institution affords to medical practitioners special facilities for acquiring technical skill and for advancing their medical and scientific knowledge. The building contains lecture- and consulting-rooms, a pathological and clinical laboratory, a Roentgen-ray room, an ophthalmoscope room, a museum, a library, and reading- and waiting-rooms, &c. Cliniques are given on each working day of the week except Saturday at 4 P.M., and a lecture on medicine, surgery, or their special branches is delivered daily except on Fridays and Saturdays, at 5.15 P.M. Classes are also held in otology, laryngology, which had proved that in typical cases of gout there was an actual increase in the excretion of uric acid in the urine in place of a marked decrease as was formerly supposed. He was in perfect agreement with Dr. Leathes as to the lack of evidence of the retention of uric acid in the system on which some writers laid stress. In recent years the view that uric acid was the cause of gout had been almost universally abandoned; coincidently, there had occurred a widespread adoption of the view that excess of purins was the main etiological factor in the development of the disease. Dr. Watson desired to raise a protest against the too ready acceptance of this view, since its general acceptance at the present time would retard knowledge of the etiology of the disease. There was no clinical or experimental evidence to indicate that the purins were responsible for inducing the clinical features of acute or chronic gout. His investigations had shown that diet could modify the structure of different tissues without apparently in many instances modifying the general health of the subject. There was little doubt that in these circumstances the chemistry of the animals was modified and also their predisposition to different diseases. He thought that future investigations into the pathology of purin metabolism and gout should include not only a study of metabolism along well-recognised lines but also an investigation into the structure and functions of important glands along lines suggested by the results of recent researches.

The discussion was continued by Dr. E. I. SPRIGGS (London), Sir LAUDER BRUNTON (London), Professor T. H. MILROY (Belfast), Dr. GUSTAV MANN (Oxford), Dr. F. G. HOPKINS (Cambridge), and the PRESIDENT of the section.

THURSDAY, JULY 30TH.

The chief interest of the work of the section on this day centred in a discussion on

The Causes of Dyspnœa.

Dr. J. S. HALDANE (Oxford), in opening, defined dyspnœa as any condition in which the breathing is accompanied by undue effort or discomfort or is very distinctly abnormal in type. He gave a short general summary of the factors regulating the activity of the respiratory centre, showing that under normal conditions the amount of air breathed was so regulated as to keep the partial pressure of CO_2 in the alveolar air and arterial blood constant, deficiency of oxygen having no influence in the matter. Different influences passing up the vagus nerve had an important influence in guiding the action of the respiratory muscles, but had little or no influence on the amount of lung ventilation. If the amount of CO_2 in the alveolar air became abnormally low the respiratory centre was excited by a lower partial pressure of CO_2. This modification was probably due to the formation of some substance, such as lactic acid, to which the respiratory centre was sensitive and which acted in the same direction as CO_2. He claimed that deficiency of oxygen played no part in regulating the respiratory centre. Various pathological conditions which are accompanied by dyspnœa were reviewed in the light of the conclusion just stated.

Dr. LEONARD E. HILL (London), who followed, attached much importance to the oxygen amount as a respiratory regulator.

Dr. M. S. PEMBREY (London), Dr. R. J. EWART (Liverpool), Dr. HOPKINS, and the PRESIDENT of the section also took part in the discussion.

Dr. P. T. HERRING (Edinburgh) read a paper, illustrated by a lantern demonstration, upon Changes in the Pituitary Body after Thyroidectomy.

The following papers were also accepted by the section. By Dr. N. H. ALCOCK (London): A New Apparatus for Chloroform Anæsthesia with Known Percentages of Vapour. By Dr. J. S. GOODALL (London) and Mr. H. G. EARLE: The Pancreatic Juice in Glycosuria. By Dr. GOODALL: Appetite—An Attempt at Analysis of the Psychic Factor. By Professor R. J. ANDERSON (Galway): The Question of Suggestion in its Physiological Aspects.

TROPICAL DISEASES.

THURSDAY, JULY 30TH.

The proceedings were resumed in this section, Lieutenant-Colonel Sir HAVELOCK R. CHARLES, I.M.S., being in the chair.

Sir PATRICK MANSON (London) opened a discussion on

Sanitation in Reference to Ankylostomiasis in the Tropics.

He said that it might have been thought that considering the vast extent and importance of her tropical possessions Great Britain would have been the first to grapple with the ankylostomiasis problem. It was not so, however, and it was, indeed, little to her credit that the youngest of colonising powers, the United States of America, had been first in the field and by her efforts in Porto Rico, Havana, and Panama had set them an example and shown what could be done by intelligent and energetic tropical sanitation. Ankylostomiasis occurred in all tropical and subtropical countries; in some rural districts 50 to 90 per cent. of the inhabitants were infected. Some writers regarded it in the aggregate as a more serious scourge than even cholera or yellow fever. Surely it was a matter of primary importance that if at all feasible the problem of a special and appropriate sanitation should be faced. The life-history of the cause—namely, of the worm—was adequate basis on which to found such sanitary measures, and that life-history they now knew. They might attain success by expelling the mature worm or by preventing the hatching out of the egg, or by killing the larva, or by preventing contact of the larva with the skin, or they might succeed by combination of two or more of these methods. Any attempt to eradicate ankylostomiasis by the administration of anthelmintics to the entire population of an infected area was bound to fail. It would be greatly beneficial as regards the individuals treated but not radical as regards the community because the drugging could not be efficiently carried out and fresh infection would constantly be introduced from without. Other relatively expensive measures such as the compulsory use of shoes to avoid contact with contaminated soil would never be employed. In common with many others he regarded fæcal disposal as the crux of the ankylostomiasis problem. Under ordinary conditions of native life it was the only practicable method of effectively dealing with the endemic, and meanwhile he thought that other measures had better not be pressed so that all available funds and energy should be directed to carrying out the least expensive, least irritating, and most efficient—viz., fæcal disposal. It was quite feasible, in his opinion, to get the coolie or native to drop his excrements into a hole in the ground and without contaminating the surrounding soil. The ankylostoma eggs in the absence of oxygen would not hatch, or if hatched out the larvæ would have no opportunity of getting at the human skin. In tropical countries treatment of fæces by chemicals or desiccation was out of the question if only on the score of expense. In European-owned or large native plantations or factories there would be no difficulty in establishing appropriate methods for the disposal of fæces. The Government had merely to decree that latrines of a particular type must be used and to enforce their use by fine if necessary, but it was otherwise with native villages and scattered communities. To get at these he would suggest that the responsibility for the observance of a latrine ordinance should be fixed on some local notable or head man selected by each village, community, or district, that he should be made responsible to the medical officer of the district, who in turn would be responsible to the surgeon-general of the colony, and that an inspector-general should be appointed for each group of colonies and be responsible to the Secretary of State for the effective carrying out of ankylostomiasis prophylaxis. As a subsidiary measure he would suggest making use of local post offices for the sale at cost price of anthelmintics just as had been done so successfully in India in connexion with quinine. The scattering broadcast of leaflets or posters explaining in simple language the symptoms, nature, treatment, and prophylaxis of ankylostomiasis, and above all the teaching in schools, would be of much value. Should these measures prove successful more attention might be given to the prevention of the introduction of ankylostomiasis by coolie-ships and otherwise. The matter of ankylostomiasis was a serious one for the tropics and should be faced.

Dr. W. F. LAW (British Guiana) read a paper on

Ankylostomiasis in British Guiana.

He said that ankylostomiasis was a serious disease in British Guiana. The infection was being regularly conveyed from India by newly arrived immigrants. Possibly it did not exist in the colony prior to immigration. Now it was widely distributed and affected to a very serious degree the health of the labouring population. With regard to treatment he preferred β-naphthol to thymol. It was quite as efficacious obtained leave for further professional study, and the certificate of attendance at the college during such leave is recognised by the Admiralty. The college is recognised by the University of London for hospital practice before the M.D. degree and by the Royal College of Surgeons for the necessary work before the Fellowship examination. The pathological laboratory has just recently been completely reorganised and placed in the hands of the pathologist, Dr. G. C. Low, who attends there during the whole day and gives instruction in Bacteriology and Microscopy and Tropical Medicine. A special class meets on three mornings a week from 11 to 1, and post-graduates joining the class can work in the laboratory at other times under the guidance of the pathologist. A class meets 12 times and commences at the beginning of each month. The fee for this class in bacteriology and microscopy is £3 3*s*. The fee for the hospital practice, including all ordinary demonstrations and lectures, is £1 1*s*. for one week, £2 2*s*. for one month, £5 5*s*. for three months, £8 8*s*. for six months, £12 12*s*. for one year, and is £25 for a life ticket; all fees to be paid in advance. A practitioner who cannot attend the whole course may attend any ten lectures or demonstrations during the session for a fee of £1 1*s*. A vacation class is held each year in August, the fee being £2 2*s*. for the course of one month, including hospital practice, or a ticket for a fortnight's hospital practice, including the lectures, can be obtained for £1 11*s*. 6*d*. The fee for a three months' course of instruction in the administration of anæsthetics, including a special class, is £3 3*s*., or without the class, £2 2*s*. A ticket for any of the above courses will be issued at any date. Arrangements can be made for gentlemen working for higher university examinations to be coached. The Winter Session will commence on Monday, Oct. 7th. A Special Course of six Lectures on the Medical Inspection of School Children has just been established. This course embraces points to be observed in the Medical Inspection of Children and in the Examination of their Teeth, Eyes, Throat, Nose, and Skin. The course will be completed in one week, and the fee is £1 1*s*. All communications should be addressed to the Dean, Mr. L. A. Bidwell, Post-Graduate College, West London Hospital, Hammersmith-road, W.

North-East London Post-Graduate College.—This post-graduate school is established in connexion with the Prince of Wales's General Hospital, Tottenham, N., which is recognised by the University of London as a place of [illegible] r the M.D. and M.S. degrees and [illegible] l the India Office for purposes of [illegible] are there afforded to qualified medical practitioners for taking part in the work of an active general hospital of 125 beds and for attending demonstrations of various branches of medicine, surgery, and gynæcology, with opportunities for clinical instruction in diseases of the eye, ear, throat, nose, skin, in fevers, psychological medicine, the administration of anæsthetics, and dentistry. Cliniques, lectures, and demonstrations are given by members of the teaching staff in the lecture room, in the wards, in the various out-patient departments, and in certain affiliated institutions. Operations are performed on every afternoon of the week except Saturday. Special limited classes are arranged in gynæcology, the surgical diseases of children, including orthopædic surgery, diseases of the throat, nose, and ear, diagnosis of diseases of the chest, diagnosis of diseases of the nervous system, ophthalmoscopy and refraction, analysis of gastric contents, clinical examination of the blood, diseases of the skin, abdominal surgery, radiography, bacteriology, and medical electricity. The fee for a three months' course of study, which may be begun at any time, in any single department, is one guinea. A fee of three guineas admits to the whole practice of the hospital for a similar term (one month two guineas), and a perpetual ticket for the practice of the hospital may for the present be obtained on payment of a fee of five guineas. Medical practitioners who have attended a three months' course in any department are eligible for appointment as clinical assistants in those departments. A certificate, signed by the staff, may be obtained at the end of three months' hospital attendance. A pathological museum and a pathological laboratory are available. A reading- and a writing-room, containing a reference and lending library, is provided, and tea may be obtained. The hospital is connected with the Telephone Exchange (No. 23, Tottenham).

The lecturers are as follows:—In General Medicine: Dr. Percy Kidd, Dr. R. Murray Leslie, Dr. G. P. Chappel, Dr. A. J. Whiting, Dr. A. G. Auld, and Dr. T. R. Whipham. In General Surgery: Mr. John Langton, Mr. Walter Edmunds, Mr. H. W. Carson, and Mr. J. Howell Evans. In Gynæcology and Obstetrics: Dr. Arthur Giles. In Diseases of the Eye: Mr. R. Philip Brooks. In Diseases of the Ear, Throat, and Nose: Mr. H. W. Carson. In Diseases of the Skin: Dr. G. Norman Meachen. In Fevers (at the North-Eastern Fever Hospital, St. Anne's-road): Dr. Frederic Thomson. In Diseases of Children: Dr. G. F. Still. In Diseases of the Chest (at the Mount Vernon Hospital and the Northwood Sanatorium): Dr. J. E. Squire. In Psychological Medicine (at the Colney Hatch Asylum): Dr. S. J. Gilfillan. In Tropical Medicine: Mr. James Cantlie. In Radiography and Medical Electricity: Dr. A. Pirie. In the Administration of Anæsthetics: Mr. A. de Prenderville and Dr F. H. Wallace. In Pathology and Bacteriology: Dr. G. G Macdonald. In Clinical Pathology: Dr. Basil Price.

The opening lecture of the winter session, in conjunction with that of the North-East London Clinical Society, will be given at the hospital at 4 P.M. on Oct. 8th by Mr. Jonathan Hutchinson, F.R.S. Further information, with prospectus and syllabus of lectures and demonstrations, may be obtained from the Dean of the School, Dr. A. J. Whiting, 142, Harley-street, London, W.

PROVINCIAL.

Birmingham.—At the University of Birmingham special courses for post-graduates have not yet been instituted, except in the subject of Advanced Bacteriology (January to March) and Clinical Pathology and Bacteriology (April to June), but the various departments of the University are open to graduates who can attend any of the systematic courses on payment of a fee. Graduates may also work in the laboratories under the supervision of the professors for a small fee to cover the incidental expenses. Applications for information should be made to the Dean.

Bristol.—Courses of post-graduate instruction adapted to the requirements of those proceeding to the M.D. degree of the Universities, each lasting about 12 weeks, will be held at the Bristol Royal Infirmary and General Hospital. The course will consist of: (*a*) clinical demonstrations on cases selected from the wards and from out-patients in medicine, obstetrics, dermatology, and laryngology; and (*b*) tutorial classes in medicine, obstetrics, pathology, laryngology, bacteriology, and dermatology. Classes in clinical medicine will be held twice a week—once at the Infirmary and once at the Hospital—by Dr. F. H. Edgeworth at the Infirmary and by Dr. J. Michell Clarke and Dr. J. O. Symes at the Hospital. Classes in obstetrics will be held once a week on alternate weeks at the Infirmary and Hospital by Dr. Walter C. Swayne and Mr. D. C. Rayner respectively. A class in pathology will be taken once a week in the museums of the Infirmary and Hospital on alternate weeks by Professor Walker Hall and Dr. Carey Coombs respectively. Six demonstrations on dermatology will be given by Dr. J. A Nixon and Dr. W. K Wills at the Infirmary and Hospital. Six demonstrations on laryngology will be given by Dr. Watson Williams at the Infirmary. A practical course in bacteriology consisting of six demonstrations will be held by Professor Stanley Kent at University College. A tutorial class in medicine will be held on one evening a week by Dr. G. Parker, Dr. Newman Neild, and Dr. J. R. Charles in rotation and a similar class in obstetrics will be taken once a week by Dr. Walter Swayne and Mr. Rayner alternately. The fees are as follows:—For the whole course, £7 7*s*.; for classes in clinical medicine, pathology, laryngology, and bacteriology and tutorial class in medicine, £5 5*s*.; for classes in obstetrics, pathology, and bacteriology, £3 3*s*.; and for clinical medicine and obstetrics only, £3 3*s* Applications to attend the classes should be made to Dr. Walter Swayne, 56, St. Paul's-road, Clifton, Bristol.

Cambridge.—Long vacation courses are held at Cambridge during the month of July and the first fortnight in August. This year the course included lectures and demonstrations on general and special pathology by Professor G. Sims Woodhead, on bacteriology for medical students by Dr. Louis Cobbett, an advanced course on bacteriology for students of sanitary science by Dr. G. S. Graham Smith, a course in pharmacology by Professor J. B. Bradbury and Dr. W. E. Dixon, and a series of lectures and demonstrations on protozoal diseases by Dr. G. H. F. Nuttall. The pathological and pharmacological laboratories are open to apprehended the cause of endemic anæmia and was only just beginning to consider what steps might be taken for its eradication, the ancient Egyptians appeared to have had a correct knowledge of its etiology and to have adopted measures for its treatment and prophylaxis. According to Scheuthauer and Joachim the famous papyrus Ebers (1550 B.C.) rightly ascribed the disease to an intestinal worm, and von Oefele had pointed out that a connexion between the disease and the carrying and handling of sand was fully recognised. Might not the extraordinary veneration of the ancient Egyptians for the dung-beetle, the Ateuchus sacer of modern entomologists, be connected with the prophylaxis of ankylostomiasis and other infections spread by the means of contaminated fæces? He made the suggestion merely as a matter of archæological curiosity. They all knew what an important part the scarab played in the theogony of the banks of the Nile. This remarkable insect was represented on all the monuments of the Pharaohs from the great Delta to the very heart of Nubia: it was carved of all dimensions and in every possible material more frequently than any other figure. Evidently the ancient Egyptians, perfectly cognisant of the benefit derived from this wonderful scavenger beetle, looked upon it as a tutelary god. That suggestion seemed to him more plausible than any of the fanciful reasons hitherto advanced to explain why they considered the dung-beetle as sacred. In support was the fact that other animals likewise had been consecrated by the Egyptians in order to protect and to preserve them on account of the beneficial action which they exercised in keeping down vermin. He need but mention the cat, the kestrel, the viper —natural enemies of the plague-conveying rat. In 1900, in the Roman Campagna, he had had the opportunity of studying the habits of the sacred dung-beetle, and he had been struck by the rapidity with which excreta, scarcely dropped, were cut up, formed into pellets, and buried deeply in the soil. It would be impossible to find a more perfect method of fæcal disposal.

Dr. C. W. DANIELS (London) stated that he did not think sufficient importance had been attached to the destructive action of certain dipterous larvæ, particularly those of the sarcophagidæ, which lived in the fæces till nearly mature and destroyed all thin-shelled entozoal eggs. He was not in favour of compulsion by government and thought that more could be done by quiet action on the part of the medical authorities than by active government action which might defeat its own ends.

Dr. F. M. SANDWITH (London) said that he used to be an ardent exponent of the virtues of thymol, but the severe effects produced in some patients had caused him now for some years to prefer β-naphthol or the combination of eucalyptol, chloroform, and castor oil. The important question of prophylaxis could be most easily and most cheaply met by preaching the doctrine of early burial of fæces in dry earth or sand. The ankylostoma eggs could not develop without moisture. Ankylostomiasis as an endemic disease should be treated as regards fæcal disposal as they had learnt to treat epidemics of cholera and enteric fever.

The PRESIDENT of the section said that Dr. Sambon had referred to the sanitary work of the ancient Egyptians; he might also have referred to the better known sanitary laws of Moses. What did the Hebrew do when going to the field in the early morning. He had a "paddle upon his weapon" and making a hole he buried and covered up his deposit therein. Thus were destroyed myriads of ankylostomes. The crux of the whole question, as Sir Patrick Manson had said, was fæcal disposal. He believed in education. If they got at the children in a generation they would have the adults.

Sir PATRICK MANSON, in reply, said that he was glad to gather from what had been said that the section was quite in sympathy with his remarks on the desirability of an effort being made to mitigate the plague of ankylostomiasis in the tropics, and further that the method of attack should be directed towards fæcal sanitation.

Dr. ROBERT T. LEIPER (London) stated that that very morning he had been able to examine, together with Dr. Sandwith, a supply of worms from an anæmic boy sent by Dr. T. L. Bancroft of North Queensland and that he had found both ankylostoma duodenale and necator Americanus. This record of the presence of both known forms in Australia was highly interesting and rounded off their information of the geographical distribution of the "American" form.

Dr. A. PLEHN (Berlin) read a paper on

The Diagnosis of Latent Malaria.

He said that three phases might be distinguished, a first phase or "primary period of latency," lasting from the moment of infection to the first pyrexial attack and characterised by nervousness, dyspepsia, more or less anæmia, and the presence of basophilic granules in the erythrocytes; a second phase made up of "intermediate periods of latency" intervening between the single paroxysms and characterised by the presence of parasites, particles of pigment in the leucocytes, especially the large mononuclears, basophilic granules in the erythrocytes, and relative increase of the large mononuclears; and finally a third phase, or "final period of latency," following the last recurrence of fever and not usually lasting over six months. He pointed out that the presence of urobilinuria might indicate the presence of latent malaria when all other signs were wanting. It was not a specific sign like the presence of gametes in the blood; it was merely a symptom of liver disturbance and might not be present in every case of malaria, but its presence after malarial fever and in the absence of any other cause which might explain the liver affection certainly proved that the malarial infection was not entirely spent.

Dr. E. MARCHOUX (Paris) read a paper on

Dysenteric Amœbæ and Liver Abscess.

Sir PATRICK MANSON said that it was a matter of gratification to the Section of Tropical Diseases that men of the high standing of Dr. Plehn and Dr. Marchoux thought it worth their while to be present there and to take part in their work. Both of them had served a long apprenticeship in tropical pathology and had attained positions of special distinction in that department of medicine. The importance of recognising latent malaria was especially great in regard to Great Britain and her tropical possessions. Any method that would enable them to recognise when a man was the subject of latent malaria or when he was free from infection would be a welcome addition to practical medicine. The presence of basophilic granules in the erythrocytes was an unreliable test, for they occurred in many other infections, notably trypanosomiasis. With regard to the administration of quinine, those who had been in the habit of taking it as a prophylactic in tropical countries should continue its use for at least three months after their return to England and intermittingly for a further period of one to two years. He had many times seen the disregard of this practice culminate in attacks of blackwater fever, sometimes fatal.

Dr. MALCOLM WATSON (Federated Malay States) read a few remarks on Rare Nervous Symptoms seen in Malarial Patients.

Dr. SAMBON said that blackwater fever had been mentioned both by Dr. Plehn and Sir Patrick Manson in conjunction with malaria, and he seized the opportunity again to state most emphatically that blackwater fever was a disease entirely distinct from any of the known forms of malaria. Many years had passed since he first pointed out that blackwater fever was a specific disease more closely allied to the babesia infections of the lower animals and to yellow fever than to malaria. Now he was more than ever convinced of the correctness of his hypothesis, and information which he had been able to gather tended to show that the disease might be conveyed by the agency of ticks.

FRIDAY, JULY 31ST.

Dr. DANIELS opened a discussion on

Lymphatic Diseases in the Tropics.

He said that in practically all tropical diseases some implication of the lymphatic system did or might occur, whether the diseases were due to bacteria, protozoa, or metazoan parasites. In many the lymphatic condition was only of diagnostic value, as it led to little or no direct ill effect. In many of the protozoal diseases enlargement of the glands might be met with. In trypanosomiasis the superficial glands, especially those of the neck, were early involved and were of great diagnostic value: not only could the enlarged glands be readily felt but trypanosomes were more readily found on gland puncture than in the peripheral blood. Cutaneous breaches of continuity from biting arthropoda, ticks, flies, mosquitoes, and the like, and in some places from leeches, were so frequent that naturally lymphangitis and adenitis were more common than in England. It was therefore of interest to notice that such surgery will be treated simultaneously. The clinics in the Royal Infirmary will also be arranged so far as possible to correspond. Notices of operations will be posted daily at the entrance to the infirmary. The fee for the surgical course is 10 guineas. The medical course extends over the same period as the surgical—viz., from August 31st to Sept. 26th. It is divisible into two independent fortnights. The fee for either fortnight is 3 guineas, while for the four weeks the composite fee is 5 guineas. In addition to special medical clinics, clinics on diseases of children and medical ward visits, series of clinics will be held upon neurology, dermatology, diseases of the eye and the exanthemata, while series of demonstrations will be given upon medical anatomy, morbid anatomy, tropical diseases, the pathology of the eye, and infant feeding. Those attending the general course may also attend any of the surgical clinics or ward visits in the Royal Infirmary and Royal Hospital for Sick Children which are held between the hours of 11 and 1.30. In addition to the two courses above referred to a number of classes will be in progress admission to which will be open to anyone who has entered for either the surgical or the general course on payment in the case of each class of an additional fee of 1 guinea. These classes are clinical bacteriology, diseases of the blood (this class is specially intended for those who have some previous knowledge of the methods of blood examination), practical gynæcology, diseases of the ear, nose, and throat, ophthalmoscopy, and errors of refraction. These classes, the attendance upon which is limited, are so arranged that they do not clash with each other or with the important classes included under the general course. Each day throughout the course a lecture will be delivered at 5 o'clock upon some subject of general interest. These lectures are open to all those attending either the surgical or general course. Accommodation may be obtained during September at one of the residences of the University Hall. Information regarding other accommodation may be obtained from the secretary. The committee of the University Union has decided to open the building during September for the use of graduates attending the course. Graduates of any university are eligible for temporary membership for one month on payment of a fee of 5*s.* The Union, which adjoins the University buildings, contains a library, reading-rooms, dining hall, smoking-room, billiard-room, &c. Copies of the syllabus of the September course may be obtained from the secretary, the Faculty Office, University New Buildings, Edinburgh.

Glasgow.—At Glasgow the possibilities for post-graduate work are considerable and in almost every department graduates have opportunities for acquiring more special knowledge or carrying on original work. In pathology, courses in "Practical Bacteriology" and "Pathological Histology" for graduates will be commenced in the pathological department of the Western Infirmary on Monday, Oct. 19th. The courses will extend over eight weeks, each class meeting thrice weekly. The fee for either course is £3 3*s.*, and for both courses £5 5*s.* In the Pathological Institute there is a limited number of rooms specially fitted up for research work and arrangements can be made for graduates who are desirous of engaging in work of this nature. Those interested in embryology may take out the practical course, or if they desire to do special work may obtain the use of a table in the embryology laboratory with such guidance and help as the lecturer can give. The University also has the right of nomination to a table in the laboratory of the Marine Biological Station at Millport. This station is happily circumstanced as regards the richness and variety of the fauna which can readily be obtained and kept alive in the tank rooms under approximately natural conditions. It thus offers facilities for various kinds of biological study and particularly for physiological and pharmacological work on the marine invertebrates. Further information regarding the station can be got from the honorary secretary, Mr. Geo. Middleton, 83, Bath-street, Glasgow. Post-graduate instruction in public health laboratory work is given in the University laboratory during both winter and summer sessions, and opportunities are offered under prescribed conditions for original research work. As regards physiology and materia medica the new laboratories are now in working order and every facility is afforded to those wishing to engage in original research work. During the winter months classes in physiological chemistry and physiological psychology will be conducted by the University lecturers in these subjects. In the eye infirmary Dr. A. F. Fergus conducts every autumn a course of post-graduate instruction on refraction testing and on squint. The course extends over a period of two months and the meetings are held twice weekly—namely, on Tuesdays and Fridays in the afternoon. At Anderson's College Medical School the Public Health Laboratory course, conducted by Dr. Carstairs Douglas, is open to all qualified medical practitioners (including women), and is recognised for the Diploma in Public Health by the University of Cambridge, the Scottish Conjoint Board, and the Irish Colleges. The laboratory is fully equipped and the complete course in Chemistry, Bacteriology, and Microscopy is carried out. It is supplemented when desired by a three months' course of lectures on Sanitation, Vital Statistics, and Sanitary Law, attendance on which enables candidates to dispense with three months of the outdoor Public Health work. The course will commence on Oct 15th. As regards Operative Surgery, graduates desirous of taking out a course in this subject can obtain the necessary facilities by arrangement with the Dean of Anderson's College. The new Maternity Hospital, only opened last May, gives exceptional scope for post-graduate work. There are 110 beds and a large out-door department. Two physicians are on duty at a time and there is a daily clinique. The fees for post-graduate work are £3 3*s.* for a month, £6 6*s.* for three months, and £10 10*s.* for six months. There is also a residence in the hospital grounds, for 15 persons, and available both for graduates and students, board and lodging being charged at £1 7*s.* 6*d.* per week. Post-graduate classes are conducted at the Royal Infirmary during the autumn months. The different courses are as follows:—1. Clinical Medicine: (*a*) Dr. G. S. Middleton, at 9.30 A.M., on Mondays, Wednesdays, and Fridays during September, beginning Sept. 2nd; (*b*) Dr. T. K. Monro, at 4.30 P.M., on Thursdays, Sept. 3rd, 10th, 17th, and 24th; (*c*) Dr. J. M. Cowan, at 4 P.M., on Friday, Monday, and Tuesday, Sept. 25th, 28th, and 29th. 2. Clinical Surgery: (*a*) Mr. John Barlow at 4 P.M., on Tuesdays, Sept. 8th, 15th, 22nd, and 29th; (*b*) Mr. J H. Pringle, at 4 P.M., on Tuesdays and Thursdays, Sept. 1st, 3rd, 8th, and 10th; (*c*) Mr. John A. C. Macewen, at 11 A.M., on Tuesdays, Sept. 1st, 15th, and 29th. 3. Hæmatology: Dr. Walter K. Hunter, at 4 P.M., on Wednesdays, Sept. 2nd, 9th, 16th, 23rd, and 30th. 4. Surgical Diseases of the Urinary Organs: Dr. David Newman, at 4.15 P.M., on Tuesdays and Fridays, Sept. 1st, 4th, 8th, 11th, 15th, 18th, and 22nd. 5. Clinical Examination of the Urine: Dr. John Henderson, at 4 P.M., on Tuesdays and Fridays, Sept. 1st, 4th, 8th, 11th, 15th, and 18th. 6. Gynæcology (*a*): Dr. G. Balfour Marshall, at 10 A.M., on Tuesdays and Fridays, Sept. 18th, 22nd, 25th, and 29th. 7. Diseases of the Ear: Dr. J. Kerr Love, at 4 P.M., on Wednesdays, Sept. 2nd, 9th, 16th, 23rd, and 30th, and at 11 A.M., on Thursdays, Sept. 3rd, 10th, 17th, and 24th. 8. Diseases of the Eye: Dr. A. Maitland Ramsay, at 2 P.M., on Mondays, Wednesdays, and Fridays, and at 8 P.M., on Thursdays and Fridays during September. 9. Diseases of the Skin: Dr. Alex. Morton, at 10 A.M., on Wednesdays, Sept. 2nd, 9th, 16th, 23rd, and 30th. 10. Diseases of the Throat and Nose: Dr. Robert Fullerton, at 10 A.M., on Tuesdays and Fridays during September. 11. Electro-therapeutics: Mr. James R. Riddell, at 9.30 A.M., on Tuesdays and Fridays, Sept. 1st, 4th, 8th, 11th, 15th, 18th, 22nd, and 25th. 12. Gynæcological Pathology: Dr. G. Balfour Marshall and Dr. W. D. Macfarlane, at an hour and on dates arranged to suit those attending. The fee for attendance at each of the above classes is £1 1*s.*; for any three of them, £2 2*s.* 13. Gynæcology: Dr. W. D. Macfarlane, at 10 A.M., on Tuesdays, Thursdays, and Saturdays. Two courses—first from Sept. 1st, second from Oct. 1st. Fee for each course, £2 2*s.* 14. Operative Surgery: Mr. Henry Rutherfurd and Mr. James Battersby, at 3 P.M. daily, beginning Sept. 2nd. Fee, £3 3*s.* 15. Bacteriology: Mr. David M'Crorie and others, five days a week for three months, beginning Oct. 6th. Fee, £3 3*s.*

IRELAND.

Belfast.—At Queen's College a course in clinical pathology, consisting chiefly of practical instruction, is given during the summer session, and, should a sufficient number desire to attend, a post-graduate course of practical work in the application of methods of chemical physiology to clinical the blood taken at night showed no filarial embryos. (None of the prisoners in this jail [300 in number] suffered from elephantiasis.)

Professor S. A. POWELL (Bombay) said that in many Indian birds—owls, kites, &c.—filariæ were common in the lymphatics and subcutaneous tissues like filaria Bancrofti in man, but they did not find any elephantiasis so far as he was aware. He might add a few figures bearing on the relative incidence of filariasis and elephantiasis. In Cachar, where elephantiasis was rare except when imported, of 256 indigenous persons whose blood he had examined only one showed filariæ. In Bombay, where elephantiasis was not uncommon, of 363 night bloods examined 18, about 5 per cent., showed filariæ. On the other hand, the families of seven cases of elephantiasis, 43 persons, showed no case of filariasis. That filariæ produced inflammation was undoubted. The phenomena of inflammation had been often studied in the cornea of the rabbit. In the swampy districts of India nature often gave them a beautiful demonstration in the case of filaria in the eye of the horse. He had often watched the course of the disease. A white worm about one and a half inches long was suddenly seen in the anterior chamber of the horse's eye, darting about like a miniature eel in an aquarium; usually the aqueous humor and cornea remained quite clear for about 48 hours, then both became steamy, iritis set in, and in four days' time the cornea was dead white and opaque unless the worm had been removed.

Professor A. CASTELLANI (Ceylon) described a palliative treatment of elephantiasis by means of thiosinamin or fibrolysin injections and methodical bandaging, followed by removal of portions of the redundant skin when most of the fibrous tissue had been absorbed.

The PRESIDENT of the section disputed Manson's theory of elephantiasis. The anatomical arrangement of the lymphatics—as to distribution and valvular mechanism—prevented the ova from passing from one side of the body to the other and the theory demanded the presence of an aborting female in many and various parts to account for the clinical fact that the disease in the scrotum was usually symmetrical. After complete removal of a scrotal tumour there was no return of the trouble, although the so-called "obstruction" remained. But a recurrence would surely follow if the least amount of unhealthy tissue remained in penis or perineum. This showed that the disease was in the parts removed and not in those that were left. He spoke at length of treatment.

Dr. NATTAN-LARRIER described some interesting cases of sleeping sickness with nervous and mental symptoms.

Dr. DANIELS then replied. With regard to the symmetrical condition of the scrotal affection he said that that was common to all conditions where the loose cellular subcutaneous tissues of the scrotum were involved. The non-infection of other members of families he had observed in British Guiana with regard to filariasis. Frequently one member only of a family was infected. A person with elephantiasis having no embryos in his peripheral blood was not so likely to infect other members of the family as a person with filariæ and without lymphatic obstruction.

Mrs. BONTE SHELDON ELGOOD (Cairo) read a paper on

Bilharziosis among Women and Girls in Egypt.

It showed that the disease was common in young girls, even in those who did not bathe and who used filtered water only. Town children were frequently affected. Bilharziosis was rare in adult women who might, however, have suffered from it in youth. European women and girls were not known to suffer from it, though in the towns they drank and washed in water from the same source as natives used. Water, however, was not stored in European households. Infection was probably not due mainly to bathing, as had been suggested. It was possibly due to faulty storage of drinking water or to the eating of raw vegetables and fruit washed in dirty canals or rivers.

Dr. M. ARMAND RUFFER (Ramleh, Egypt) said that he was of opinion that women in early life were as much infected as were men. Infection might be due to ablutions and was possibly rectal.

Dr. SANDWITH said that Dr. Ruffer's suggestion would hardly explain the prevalence of bilharziosis in the English soldiers in South Africa.

Sir PATRICK MANSON said that Mrs. Elgood had made a most important contribution towards the solution of the problem of the etiology of bilharziosis which for many years had been languishing for want of new facts. He disputed Dr. Ruffer's suggestion of infection per anum.

Dr. SAMBON then moved a vote of thanks to the President for the admirable manner in which he had conducted the business of the section.

Looking Back.

FROM

THE LANCET, *SATURDAY*, Sept. 4th, 1830.

REMARKABLE CASE OF LONGEVITY.

AT the meeting of the Medico-physical Society of Florence, on the 13th of December, Dr. Buzzi related the case of a female of his acquaintance, who at that time was 94 years of age, and in the history of whose life there were some rather curious circumstances. Her family had been remarkable for longevity; her father died in his 106th year, her grandfather, by her father's side, in his 109th year, and her mother's father in his 89th year; the latter had, even at his old age, been remarkable for his bodily strength. The woman herself had been rather a delicate child, she was married in her fifteenth year; in the third month of her marriage she menstruated for the first time, and in the fourth she became pregnant; in five years she had borne three children. At this period her husband died, and she became soon afterwards subject to hysterics, which it is stated were most effectually obviated by violent exertion; she was passionately fond of dancing, hunting, and riding on horseback, and frequently, when heated, threw herself into a river or a cold bath. This mode of life brought on violent headache, which with slight intermissions continued to her 40th year, when it yielded to the abrasion of the hair; it always returned, however, as soon as the hair had grown to about two inches in length. In other respects, she was in perfect health, in very good spirits, and of most extraordinary appetite, in which she also fully indulged; three chickens, or from five to six pounds of roast meat, and twenty oranges or peaches, were just sufficient for her breakfast. In her 45th year, her eldest son (who at the time of the report was 77 years old, and in the full enjoyment of health) received, in battle, a wound in the left breast, and the fright which this accident caused, produced, strangely enough, a hæmorrhage from her left breast; the discharge was not copious, but continued for two years. Her menses had always been rather scanty, and she had frequently been subject to various hæmorrhages. In her 53rd year menstruation ceased, but reappeared eight months afterwards, and *continued regularly to her 94th year*, which is the age she had attained at the time of the report. She is rather of small stature, but of very robust frame, and possesses the full use of all her senses; she sleeps only five hours, gets up at day-break, and takes a walk of several hours; her manner of life is extremely simple, and though her appetite is rather strong, her meals are frugal, especially if compared with what she formerly had been used to. She sleeps an hour after dinner, the rest of the day she is continually engaged, being employed either in domestic affairs or reading; she walks very much, and so quick, that sometimes young people are scarcely able to follow her. Six years ago she met with an accident and broke both arms, but was perfectly cured within four weeks. At present she is in perfect health; at night only she has sometimes slight attacks of dyspnœa and agitation; when they occur, she gets up and opens the window; the fit then generally subsides, if not, she goes out into the open air, and after about half an hour's walk, feels perfectly well again.—*Ann. di Med. Fis. di Maggio e Giugno*, 1830, page 595.

THE BRITISH ASSOCIATION.—Since the provisional programme of the Chemistry Section of the British Association was announced the following additional papers have been promised: (1) the Liquefaction of Helium, by Professor Dr. Kamerlingh Onnes; (2) Anticipations and Experiments on the Liquefaction of Helium, by Sir James Dewar; and (3) Note on a Volatile Compound of Cobalt with Carbon Monoxide, by Dr. Ludwig Mond and others. These communications are awaited with great interest.

from measles, 42 from scarlet fever, 37 from diphtheria, and 21 from "fever" (principally enteric), but not one from small-pox. The deaths from these epidemic diseases during the week under notice were equal to an annual rate of 4·3 per 1000, against 2·3, 3·6, and 4·3 in the three preceding weeks; in London the death-rate from these epidemic diseases last week did not exceed 3 5. No death from any of these epidemic diseases was registered last week in Northampton, Ipswich, or Great Yarmouth, whereas the annual death-rates therefrom ranged upwards in the other large towns to 10·0 in *Hanley*, 10·7 in Walsall, 11·3 in Hull, 12·1 in Middlesbrough, and 16·4 in Rhondda. The deaths attributed to diarrhœa in the 76 towns, which had steadily increased in the 11 preceding weeks from 63 to 1133, declined slightly to 1124 in the week under notice, but caused annual death-rates ranging upwards to 10·0 in Hanley, 10 6 in Hull, 11·6 in Middlesbrough, and 15·3 in Rhondda. The 64 fatal cases of whooping-cough showed an increase of 15 upon the number in the previous week, while the 56 of measles showed a decline of 14; whooping-cough was proportionately most fatal in Walsall, Devonport, and Gateshead, and measles in Stockport, Warrington, Bury, and Rochdale. The 37 deaths from diphtheria were fewer by nine than those in the previous week, but included 14 in London and its suburban districts, seven in Birmingham and its suburbs, and three in Manchester and Salford. The 42 fatal cases of scarlet fever showed a marked increase upon recent weekly numbers, including 16 within the metropolitan area, four in Birmingham and Smethwick, seven in Liverpool and Bootle, and three in Manchester. Of the 21 deaths referred to "fever," three occurred in Norwich, in which city 31 deaths have resulted from this cause since the beginning of this year. The number of scarlet fever patients under treatment in the Metropolitan Asylums and the London Fever Hospitals, which had increased in the six preceding weeks from 2573 to 2844, had declined to 2825 on August 29th; the number of new cases of this disease admitted to these hospitals during the week under notice were 377, against 343 and 392 in the two preceding weeks. *The deaths in London referred to* pneumonia and other diseases of the respiratory organs, which had been 132, 128, and 106 in the three preceding weeks, rose again to 132 in the week under notice, and exceeded by nine the corrected average number in the corresponding week of the five years 1903–07. The causes of 42, or 0·9 per cent., of the deaths registered in the 76 towns last week were not certified either by a registered medical practitioner or by a coroner. All the causes of death were again duly certified in Leeds, Bristol, West Ham, Bradford, Newcastle-on-Tyne, and in 47 other smaller towns during the week under notice, while in London all but two of the 1327 causes of death were certified; eight uncertified causes of death were, however, registered in Liverpool, four in Birmingham, three in Sheffield, and two each in Warrington, Sunderland, and Gateshead.

HEALTH OF SCOTCH TOWNS.

The annual rate of mortality in eight of the principal Scotch towns, which had been equal to 12·8 and 13·4 per 1000 in the two preceding weeks, further rose to 15·2 in the week ending August 22nd. During the first eight weeks of the current quarter the annual death-rate in these eight towns averaged 13·5 per 1000, and exceeded by 0·7 the mean rate during the same period in the 76 English towns. Among the eight Scotch towns the death-rate during the week under notice ranged from 12·6 in Aberdeen and 12·7 in Edinburgh and in Paisley, to 16·5 in Glasgow and 21·1 in Greenock. The 536 deaths in the eight towns showed a further increase of 65 upon the numbers in the two preceding weeks, and included 107 which were referred to the principal epidemic diseases, against 61, 73, and 79 in the three preceding weeks; of these 107 deaths, 63 resulted from diarrhœa, 19 from whooping-cough, 15 from "fever," seven from diphtheria, and three from measles, but not one either from scarlet fever or small-pox. These 107 deaths were equal to an annual rate of 3·0 per 1000, which was 1·3 below the mean rate from the same diseases during the week in the 76 English towns. The deaths attributed to diarrhœa in the eight towns, which had been 30, 47, and 48 in the three preceding weeks, further rose to 63 in the week under notice, [illegible] four in Edi[illegible] The fatal cases of whooping-cough, which had been 15 and 18 in the two previous weeks, further rose last week to 19, including ten in Glasgow, four in Dundee, and three in Edinburgh. The 15 deaths referred to "fever" showed a marked increase upon recent weekly numbers, eight being certified as enteric and seven as cerebro-spinal meningitis; of these 15 deaths 12 were recorded in Glasgow, six certified as enteric and six as cerebro-spinal meningitis. The seven deaths from diphtheria, of which three occurred in Glasgow, exceeded the numbers in recent weeks. Two of the three fatal cases of measles were returned in Glasgow. The deaths referred to diseases of the respiratory organs in the eight towns, which had been 54 and 45 in the two preceding weeks, rose to 48 in the week under notice, but were five below the number returned in these towns in the corresponding week of last year. The causes of 11, or 2·1 per cent, of the deaths registered in the eight towns during the week were not stated or not certified; in the 76 English towns during the same week the proportion of uncertified causes of death did not exceed 0·7 per cent.

The annual rate of mortality in eight of the principal Scotch towns, which had been equal to 12·8, 13·4, and 15·2 per 1000 in the three preceding weeks, further rose to 15·4 in the week ending August 29th. During the first nine weeks of the current quarter the annual death-rate in these eight towns averaged 13·7 per 1000 and exceeded by 0·6 the mean rate during the same period in the 76 English towns. Among the eight Scotch towns the death-rate during the week under notice ranged from 9·9 in Leith and 10·4 in Perth to 17·9 in Paisley and 21·7 in Dundee. The 544 deaths in the eight towns showed a further increase of eight upon the numbers returned in the three preceding weeks, and included 96 which were referred to the principal epidemic diseases, against 79 and 107 in the two previous weeks; of these 96 deaths, 60 resulted from diarrhœa, 17 from whooping-cough, ten from "fever," five from diphtheria, three from measles, and one from scarlet fever, but not one from small-pox. These 96 deaths were equal to an annual rate of 2·7 per 1000, which was 1·6 below the usual rate from the same diseases during the week in the 76 English towns. The deaths attributed to diarrhœa in the eight towns, which had increased from 30 to 63 in the four preceding weeks, declined again to 60 in the week under notice, and included 29 in Glasgow, 14 in Edinburgh, seven in Dundee, five in Paisley, three in Aberdeen, and two in Greenock. The 17 fatal cases of whooping-cough were fewer by two than those in the previous week; 11 occurred in Glasgow, three in Dundee, and two in Paisley. The deaths referred to "fever," which had been five and 15 in the two preceding weeks, declined again last week to ten, of which six were certified as cerebro-spinal meningitis and four as enteric; seven of the ten occurred in Glasgow, two in Edinburgh, and one in Dundee. Of the five deaths from diphtheria, two were returned in Glasgow and two in Dundee; and two of the three fatal cases of measles occurred in Glasgow. The deaths referred to diseases of the respiratory organs in the eight towns, which had been 45 and 48 in the two preceding weeks, further rose to 75 in the week under notice, and exceeded by 23 the number returned in these towns in the corresponding week of last year. The causes of 22, or 4 0 per cent, of the deaths registered in the eight towns during the week were not stated or not certified; in the 76 English towns during the same week the proportion of uncertified causes of death did not exceed 0·9 per cent.

HEALTH OF DUBLIN.

The annual rate of mortality in Dublin, which had been equal to 16·8, 18 5, and 20·9 per 1000 in the three preceding weeks, further rose to 24·1 in the week ending August 22nd. During the first eight weeks of the current quarter the death-rate in Dublin averaged 19·2 per 1000; the mean rate during the same period did not exceed 11·8 in London and 12·3 in Edinburgh. The 182 deaths of Dublin residents during the week under notice showed a further increase of 24 upon the numbers returned in the three preceding weeks, and included 44 which were referred to the principal epidemic diseases, secretions. Mental impressions have a notable influence upon menstruation, pregnancy, and lactation in women, while the term melancholia is expressive of a marked mental state correlated with a bodily one as marked. Depressing surroundings and emotions have an undoubted effect upon the nutrition of the body, and, in the predisposed, emotional states, perhaps of no great intensity, produce at times various functional palsies. On the sensory side there is little doubt that if special attention be paid to a viscus abnormal feelings with regard to it can be educated into prominence. If these and many other facts can be adduced to indicate the marked ill-effects which can be produced upon the body by mental states, so also may many be adduced which indicate that these ill-effects can be, and constantly are being, neutralised by causes as psychical in character as those which produced them. Herein lies the value of psycho-therapeutics—it is an organised and rational appeal to the highest psychic centres to assert themselves and to prove their superiority to centres that are lower. The good effects of the method are, as might have been expected, most marked in the functional disorders of the nervous system. Applied patiently and persistently by *those* capable *of* differentiating organic from functional disease the method is of the greatest value; applied indiscriminately to organic disease it is doomed to failure except in so far as that all patients, whether suffering from organic or functional disease, are rendered more *comfortable* by confident and cheery optimism on the part of the medical attendant and less *comfortable* by a gloomy pessimism. The use of *psycho-therapeutics* is no new thing, however novel it may appear to be in the circles in which it is becoming a craze, but its *systematisation* and reasoned application is a matter of the *last* quarter of a century. To our profession is happily *due the* scientific use of the method and it is a pity that *it should be exploited* by certain pseudo sciences the practitioners of which are not instructed enough to understand what happens to their *patients. The latter* are generally drawn from a neurotic class whose members, even though intelligent and *educated, are* singularly credulous, although their faith in any one method *of healing* is little likely to be long-lived.

To CHARCOT and those who *delight to call him* master, DÉJERINE, BRISSAUD, and others of the French school, is due the honour of having definitely established psycho-therapeutics as a principle *of* treatment, and the mere mention of their names is a guarantee *of the* scientific value of the achievement. Anyone who *has* had the pleasure of seeing M. DÉJERINE'S ward in the Salpêtrière *and* the crowd of patients who are there treated by *this method* with the aid of its adjuvants isolation and alimentation, must have been struck by the remarkable character *of the results*. It is not given to all to possess the *winning personality* of M. DÉJERINE but it is open to many *more* than now make the attempt to use his methods with *considerable hope* of success. His late *internes* M. CAMUS and M. PAGNIEZ have not long since published a work "*Isolement et Psychothérapie*" which contains an admirable exposition *of* the practice at the Salpêtrière and a detailed history of the use of the method in times gone by. We commend this book to our readers.

The Asthenic Constitution.

AFTER many years' study of the various conditions to which the names of floating kidney, gastroptosis, enteroptosis, Glénard's disease, nervous dyspepsia, hyperacidity, and neurasthenia are applied, Professor STILLER found that they frequently occurred in association with one another in the same person and that the individuals suffering from them conformed to a type showing certain anatomical peculiarities, notably a mobile condition of the tenth rib and a more or less characteristic bodily conformation. He therefore integrates these various groups of symptoms into a nosological or clinical unit, to which he applies the name of morbus asthenicus[1] and of which he regards the anatomical features as developmental stigmata. He further regards the condition as of congenital origin and points out that it is not infrequently found in several members of the same family and that it is *often transmitted* hereditarily. He even goes so far as to say that when in a child he finds an "atonic" habit of body and the costal sign of mobility of the tenth rib he regards these as premonitory of the development in the future of neurasthenia, dyspepsia, and enteroptosis.

It is of some interest to trace the reasoning by which Professor STILLER has arrived at his conclusions as set forth in the chapter in his book devoted to the history of the various conditions found in association with the asthenic constitution which he postulates. He briefly summarises the history of the condition of floating kidney which was known so far back as the sixteenth century but was first established clinically by RAYER in 1841. Next he refers to LEUBE'S epoch-marking studies in connexion with the conditions of nervous or functional dyspepsia in 1878, although he admits that these conditions were recognised by English, French, and American observers before that date. He then refers to BEARD'S well-known observations on the condition to which he applied the name neurasthenia in 1869. Professor STILLER regards GLÉNARD'S observations dating from 1887 on the condition with which his name is now associated as marking a notable advance, because of the recognition of the association of floating kidney with other visceral proses. Then coming to his own personal observations, he first noticed in the year 1891 during the examination of patients with enteroptosis that they frequently *presented* a *peculiarity* in regard to the tenth ribs the ends of which often caused noticeable projections beneath the abdominal wall instead of being closely applied to the cartilage of the ninth, and further that they were often freely moveable—indeed, they were found to conform more to the type of the eleventh and twelfth, with blunt-ended cartilage instead of a more prolonged one reaching to a fine apex as in the normal. On further investigation he found that this abnormality was usually associated with a characteristic habit of body to which he applied the term of "atonic habit." Briefly stated, this comprises a delicate build *of* skeleton, a long, narrow, and flat chest, sloping ribs, with broad intercostal spaces and an acute epigastric angle,

notification elsewhere justifies this belief, and it is incumbent upon those who support it to furnish the evidence for the creed.

The experience of Germany is, we think, to the effect that relatively early cases can be secured without compulsory notification in a country where there is a system such as the German Workmen's Insurance, the "invalidity" branch of which has exercised such a happy influence upon tuberculosis in Germany. We are much interested to see that Mr. LLOYD-GEORGE has had his attention drawn to this subject during his recent investigations in Germany, and we hope that by way of furthering the health and social reform of our working classes he will ascertain how far such a system could be grafted on to our friendly societies and other organisms of similar nature. A statesman who would introduce this system into England would thereby erect for himself a monument which would last for all time—these words savour of exaggeration, but we believe them to be accurate. In the meantime, we are inclined to think that Mr. BIRRELL would be well advised to do all in his power to promote voluntary notification, and in instances in which the compulsory measure may seem to be desirable to allow it only under the conditions which obtain in Sheffield and Bolton—i.e., that no person suffering from pulmonary tuberculosis shall be subject to the provisions of the penal clauses applicable to such a disease as small-pox. Sir JOHN BYERS refers to the fall in the death-rate from tuberculosis in New York, where compulsory notification had been in force for several years, and he presumably implies that such fall is due to the notification and the measures taken in consequence of the facts revealed. But we are under the *impression* that there was an enormous fall in the death-rate of tuberculosis in that city before the introduction of notification, so that it is a difficult matter to determine how far, if at all, such fall has been hastened by the measures taken. In dealing with tuberculosis we are face to face with a vast social problem, and it is only by a thoroughly scientific study of all the facts that we can hope for a sure advance. Ireland is in a condition of general sanitary backwardness, as is shown by the fact that typhus fever is still with her, and, this being so, she cannot easily develop plans of campaign which might be successfully applied in a country where there is an elaborate system of sanitary organisation. But we have every hope that the Prevention of Tuberculosis (Ireland) Bill will, when further considered and amended, form a useful stimulus for a general advance in the sanitation of the country.

"Ne quid nimis."

THE MEDICAL MISSIONARY.

IT did not need the discussions at the Pan-Anglican Congress or at the General Assemblies of the Church of Scotland to indicate the vast field opened up by imperial expansion for the young practitioner of medicine. Co-extensive with every colony or "sphere of influence" under the British flag the medical arm has made its coöperation felt as a powerful auxiliary in the absorption of subject races and in their assimilation to the standards, moral and intellectual, of the central power. If British colonisation is the envy of rival nationalities, it owes it to the fact that solicitude and practical care for the well-being of the populations committed to its charge form an inspiring principle of its government, shown in its provision for the ailing and the injured as well as for the sanitary conditions under which the individual can live and thrive. Year by year the demand for the duly qualified practitioner and the hospital nurse invites into the missionary field an augmenting number of the British youth of both sexes whose professional equipment keeps pace with the growing wants of the communities in which they work and whose remuneration tends to increase in proportion. These communities are being gradually educated up to appreciate the value of the medical man's service, and while gratuitous assistance is freely and fully meted out in the hospitals and itinerant ambulances established for the very poor the payment of a fee for attendance is becoming the rule with those of the native population who can afford it. More than one medical speaker at the Pan-Anglican Congress dwelt on this fact—Mr. H. White, drawing on his experiences in Persia, and Dr. Ernest F. Neve, after years of work in Kashmir, concurring in the opinion that "men did not value what cost them nothing," and that fees were cheerfully paid by those whose means had been enhanced by the improved conditions of life vouchsafed to them. The self-respect thus manifested in backward races is one of the reassuring signs of the success of the civilisation brought to bear upon them and is of special significance in presence of the fact that jealousy and distrust on the part of the native population make one of the chief obstacles which the medical missionary has had to overcome. Again, on the part of the practitioner himself it is of the best augury to find him so alive to the growing responsibilities of his office that he is insisting on the necessity of post-graduate teaching as supplementary to his equipment. This, added to the unique experience which he enjoys, particularly in tropical latitudes, cannot fail to fit him more and more for coöperation with the pioneers of pathological and clinical research whose labours in those regions are steadily minimising the risks to life incurred by the European resident, while bringing the local sanitation up to a standard which must react for good on the natives themselves. A career, in fact, is opening attractively out for the medico-missionary aspirant whose life-work need not be circumscribed by the original scene of his labours but may be transferred to one or other of the Schools of Tropical Medicine of which so auspicious a commencement has been already made, and which, before the century is much older, will have so increased in number as to draw to their chairs the more accomplished and successful of that branch of the profession. Honourable ambition, going hand in hand with philanthropy and nature-study, has thus inspired more than one "pioneer of Empire" who, from Livingstone onwards, has bequeathed a record which cannot but tempt the brave young British soul to find an outlet for his energies in fields so fraught with opportunity, so replete with the prizes that wait upon the service of man.

THE HISTORY OF HYDRASTIS CANADENSIS.

IN an interesting bulletin[1] dealing with hydrastis canadensis or golden seal Miss Alice Henkel and Mr. G. Fred Klugh refer to the early history of the plant which now furnishes one of the most important of the drugs produced in the United States. As in the case of many other native American medicinal plants, the early settlers became acquainted with the properties of golden seal through

THE NEW REGULATIONS FOR THE DEGREE IN MEDICINE OF THE UNIVERSITY OF LONDON.

To the Editor of THE LANCET.

SIR,—My attention has been drawn to an article on the Revised Curriculum for the Degree in Medicine at the University of London which appeared in your columns on August 8th and which contains the following sentence: "The new regulations at the University will not, we understand, come into force for a year." As this sentence taken by itself may lead to some misapprehension, I beg to draw the attention of your readers to the following important announcement made in the Regulations, viz.:—

> *Note.*—The [illegible] Examinations, Parts I. and II., and [illegible] dicine will be held for the last time [illegible] 09.
> [illegible] Degrees and the Second Examina[illegible] d II., under Revised Regulations, 1909.

Students preparing for the medical examinations to be held in July, 1909, should therefore acquaint themselves without delay with the new curriculum.

I beg also to draw your attention to the fact that in order not to inflict hardship by bringing into force without due notice the important change affecting the length of the medical course on which you comment, the Senate have provided that certain exemptions shall be granted to students who have passed the Preliminary Scientific Examination, Part I., or the First Examination for Medical Degrees, in or before July, 1910. (See Regulations for Internal Students, Appendix, p. v., and Regulations for External Students, Appendix, p. iv.)—I am, Sir, your obedient servant,

ARTHUR W. RÜCKER, Principal.

University of London, South Kensington, S.W., August 25th, 1908.

ALBINISM IN MAN.

To the Editor of THE LANCET.

SIR,—The monograph on albinism in man for which you allowed us to appeal for material in your columns some four years ago, and in the preparation of which we have since been joined by Mr. C. H. Usher of Aberdeen, is now passing through the press. Through the generous assistance of many medical men in various parts of the world we have obtained pedigrees which, with already published cases, cover nearly 500 albinotic stocks and contain between three and four thousand albinos. We have also nearly a hundred photographs of albinos of various races. We shall, however, be very grateful to any of your readers who can, without much delay, send us additional cases. Whilst all data will be welcomed, there are several countries from which information is especially desired, and we shall be thankful to any foreign medical journals that will kindly copy this request. (*a*) Spain—total absence of information; wanted references to literature and pedigrees of albinos. (*b*) Germany—more material required or references to recently recorded cases, especially in North and North-western Germany. (*c*) European Russia and Asian Siberia—material hitherto very sparse. Is there any recent information about the "Spotted Tartars"? (*d*) China and S.E. Asia—material scanty. (*e*) American Indians—only published cases are known to us; any new material will be most welcome. (*f*) Natives of Australia and New Zealand—not many cases as yet, we should be very glad of more. In all pedigrees as many relatives as possible should be included, in addition to the parents and brethren of the albino; the albinos, perfect or partial, should be described individually. In photographs, especially of natives, a normal individual should be taken side by side with the albino; there should be a strong light and a dark background. Lastly, we shall be glad of any information on the following points:—(*a*) Congenital partial albinism, piebald skin dating from birth and stationary; (*b*) leucoderma that has become stationary; (*c*) leucoderma, whether stationary or progressive, affecting several members of the same family, ascendants, or collaterals; several such cases are known but further instances are much needed; (*d*) loss of eye-pigment or any eye trouble associated with leucoderma; (*e*) association of any form of leucosis with Addison's disease (Levi gives a number of such cases); (*f*) pigmented sarcoma occurring in albinos. Material sent to either of us, as below, will be duly acknowledged under the sender's name in our memoir.

We are, Sir, yours faithfully,

KARL PEARSON
(Biometric Laboratory, University College, London, W.C.).
E. NETTLESHIP
(Hindhead, Haslemere, Surrey).

August 22nd, 1903.

THE SALARY OF MEDICAL INSPECTORS OF SCHOOL CHILDREN.

To the Editor of THE LANCET.

SIR,—I shall be obliged if you will grant me the hospitality of your columns in order that the subjoined facts may be made known as widely as possible. The county borough council of this town are about to advertise for applications for the post of medical inspector of elementary school children at the salary of £200 per annum for whole-time services, no provision being made for increase of salary after a period of one or more years. As the town has a population of about 90,000 and has 15,000 children regularly attending school—the admissions and discharges averaging 2000 yearly—the members of the profession here consider the salary offered to be inadequate and incompatible with the performance of the duties in the most efficient manner, and hope that members of the medical profession who might think of applying for the post will consider carefully whether it is in the interests of the medical body as a whole that such small salaries should be accepted.—I am, Sir, yours faithfully,

Wigan, August 27th, 1903. A. E. HODDER.

A COMBINATION OF ABNORMALITIES.

To the Editor of THE LANCET.

SIR,—This report of a post-mortem examination will, I think, be interesting to your readers. I was assisted by Dr. W. A. Milne and Mr. J. B. Conner. The man was found dead on the premises of some large engineering works, and as no one saw him fall or receive any injury, a doubt was raised as to the cause of death. He was working on a stage about two feet from the ground. His companion, who had his back to him, not getting the assistance he expected, turned to see why this was so, and was astonished to see the deceased lying "huddled up" on the ground. He was found to be dead. The relations claimed that the deceased had been killed in the course of his work, and as I could not find externally the cause of death a [illegible] was held. The peculiar combination [illegible] warrants putting the results on record. Besides having a complete transposition of all his organs the man had marked brain and heart abnormalities.

REPORT OF POST-MORTEM EXAMINATION.

External appearances.—The body is that of a well-nourished adult male. Post-mortem rigidity was well marked and there was extensive post-mortem lividity. There were small abrasions on the right eyelid, right ear, and over the occiput. There was no wound through the skin on any part of the body. No fracture of a bone was found.

Internal appearances.—[illegible] we found that all the organs in both [illegible] idneys, spleen, pancreas, stomac[illegible]; lungs were also healthy, the left having thr[illegible]. The

Heart.—The heart was lying with [illegible] pulmonary, aortic, and tricuspid va[illegible] mitral valve was malformed. One cusp was large and greatly thickened all along its free or lower border; the other cusp measured only one-quarter of an inch from [illegible] free edge and was also rather thick. [illegible] left ventricle was hypertrophied. [illegible] shape, being small in the frontal region and very large [illegible]. On removal of the skul[illegible] lly. While removing the [illegible] uid poured out to the [illegible] and examined the brain showed marked abnormalities. Both lateral ventricles were greatly enlarged, being 6½ inches long and 2 to 2½ inches in the other diameters. The brain substance was very thin in all parts; in no part was it more than one inch thick.

I am, Sir, yours faithfully,

Greenock, N.B. EDW. MACKAY, M.B., C.M. Glasg.

notification elsewhere justifies this belief, and it is incumbent upon those who support it to furnish the evidence for the creed.

The experience of Germany is, we think, to the effect that relatively early cases can be secured without compulsory notification in a country where there is a system such as the German Workmen's Insurance, the "invalidity" branch of which has exercised such a happy influence upon tuberculosis in Germany. We are much interested to see that Mr. LLOYD-GEORGE has had his attention drawn to this subject during his recent investigations in Germany, and we hope that by way of furthering the health and social reform of our working classes he will ascertain how far such a system could be grafted on to our friendly societies and other organisms of similar nature. A statesman who would introduce this system into England would thereby erect for himself a monument which would last for all time—these words savour of exaggeration, but we believe them to be accurate. In the meantime, we are inclined to think that Mr. BIRRELL would be well advised to do all in his power to promote voluntary notification, and in instances in which the compulsory measure may seem to be desirable to allow it only under the conditions which obtain in Sheffield and Bolton—i.e., that no person suffering from pulmonary tuberculosis shall be subject to the provisions of the penal clauses applicable to such a disease as small-pox. Sir JOHN BYERS refers to the fall in the death-rate from tuberculosis in New York, where compulsory notification had been in force for several years, and he presumably implies that such fall is due to the notification and the measures taken in consequence of the facts revealed. THE MEDICAL MISSIONARY.

IT did not need the discussions at the Pan-Anglican Congress or at the General Assemblies of the Church of Scotland to indicate the vast field opened up by imperial expansion for the young practitioner of medicine. Co-extensive with every colony or "sphere of influence" under the British flag the medical arm has made its coöperation felt as a powerful auxiliary in the absorption of subject races and in their assimilation to the standards, moral and intellectual, of the central power. If British colonisation is the envy of rival nationalities, it owes it to the fact that solicitude and practical care for the well-being of the populations committed to its charge form an inspiring principle of its government, shown in its provision for the ailing and the injured as well as for the sanitary conditions under which the individual can live and thrive. Year by year the demand for the duly qualified practitioner and the hospital nurse invites into the missionary field an augmenting number of the British youth of both sexes whose professional equipment keeps pace with the growing wants of the communities in which they work and whose remuneration tends to increase in proportion. These communities are being gradually educated up to appreciate the value of the medical man's service, and while gratuitous assistance is freely and fully meted out in the hospitals and itinerant ambulances established for the very poor the payment of a fee for attendance is becoming the rule with those of the native population who can afford it. More than one medical speaker at the Pan-Anglican Congress dwelt on this fact—Mr. H. White, drawing on his experiences in Persia, and Dr. Ernest F. Neve, after years of work in Kashmir, concurring in the opinion that "men did not value what cost them nothing," and that fees were cheerfully paid by those whose means had been enhanced by the improved conditions of life vouchsafed to them. The self-respect thus manifested in backward races is one of the reassuring signs of the success of the civilisation brought to bear upon them and is of special significance in presence of the fact that jealousy and distrust on the part of the native population make one of the chief obstacles which the medical missionary has had to overcome. Again, on the part of the practitioner himself it is of the best augury to find him so alive to the growing responsibilities of his office that he is insisting on the necessity of post-graduate teaching as supplementary to his equipment. This, added to the unique experience which he enjoys, particularly in tropical latitudes, cannot fail to fit him more and more for coöperation with the pioneers of pathological and clinical research whose labours in those regions are steadily minimising the risks to life incurred by the European resident, while bringing the local sanitation up to a standard which must react for good on the natives themselves. A career, in fact, is opening attractively out for the medico-missionary aspirant whose life-work need not be circumscribed by the original scene of his labours but may be transferred to one or other of the Schools of Tropical Medicine of which so auspicious a commencement has been already made, and which, before the century is much older, will have so increased in number as to draw to their chairs the more accomplished and successful of that branch of the profession. Honourable ambition, going hand in hand with philanthropy and nature-study, has thus inspired more than one "pioneer of Empire" who, from Livingstone onwards, has bequeathed a record which cannot but tempt the brave young British soul to find an outlet for his energies in fields so fraught with opportunity, so replete with the prizes that wait upon the service of man.

THE HISTORY OF HYDRASTIS CANADENSIS.

IN an interesting bulletin[1] dealing with hydrastis canadensis or golden seal Miss Alice Henkel and Mr. G. Fred Klugh refer to the early history of the plant which now furnishes one of the most important of the drugs produced in the United States. As in the case of many other native American medicinal plants, the early settlers became acquainted with the properties of golden seal through make such an effort. Therefore the committee sitting at Berne suggested, on behalf of the International Association of the Medical Press, that the secretaries of sections should consider it a part of their work to remain after their section had adjourned and there read out slowly to the press men gathered round the summary of the speeches. These are generally written on the spot by each speaker to whom headed paper on a cardboard and a pencil are handed directly he sits down. Of course, this system is not good. A speaker desires to follow the discussion and to listen to the answers made to his observations instead of writing a summary of what he himself has said. It would be much better if a shorthand writer, employed by the congress, could take down the speeches as they are delivered. This, however, has rarely been done; not only because of the cost but because the different languages in which the speeches are delivered are not all understood by the shorthand writers. Therefore each speaker has to summarise in writing his own speech, and it is these summaries that should be placed at the disposal of the press representatives after the meetings of the sections, though, of course, care must be taken that they are not removed from the section room. But the speaker who has anything of real importance to say and has any experience of such congresses will be careful himself to write a summary and to have, at his own expense, a few hundred copies printed beforehand in the three or four official languages and to see that a copy is placed in each pigeon-hole at the door of the press room.

---

[1] Circular No 6, Bureau of Plant Industry, United States Department of Agriculture, 1908, pp. 19.

The organisers of the congress, on their side, have to give indications to the members of the congress so that the latter may find the printers and the translators whom they need. On this much of the success of the congress depends, unless competent translators in each section translate the speeches the moment that they are delivered. This, however, means that each speech has to be delivered three or four times over. At Washington it would be four times, since the Spanish language has been added to the three usual official languages—namely, English, French, and German. When only one language is spoken then every effort should be made to speak in French, as this is by far the best understood of all modern languages in such gatherings. Germans, Russians, English, and all the Latin races know French better than any other foreign language. The fact that at the International Congresses of Medicine, of Hygiene, and at these latter and more recently created Congresses on Tuberculosis, there have been no efficient translations has robbed these vast and imposing assemblies of much of their practical usefulness. Where a scientific discussion only is held translations are not so necessary. Those who do not understand may ultimately in some report or translation find out something of what was said or intended. But a fairly good translation seems to be indispensable where a vote is given on some proposed and practical question. For instance, at Washington in Section VI. the laws and ordinances relating to tuberculosis, especially with reference to notification, are to be discussed. Someone is almost sure to move a proposition in favour of compulsory notification. This is a very important practical question and there are many others as important. For members to vote on them without thoroughly understanding what has been said seems somewhat farcical. On the other hand, if there are no such resolutions, what is the use of holding these congresses? The legislator outside and the general public are waiting for men of science and those who have the necessary special knowledge to give the needed advice. Then there is the whole question of sanatoriums, farms, camps, and dispensaries for the prevention and cure of tuberculosis. How far are these worth the expenditure and who should bear the financial burden—the State, the commune, or the individual? What preventive measures, especially in regard to children and unwholesome employment, has the State the right to take? This is a burning question on the other side of the Atlantic with the scandal of child labour in the cotton mills of the Southern States. On this and many other problems men of science have to make a pronouncement. Not many are shareholders in child-worked mills. Most are men of science and only men of science. They do not seek for the votes of electors. They at least, and generally speaking, should be able and willing to pronounce an impartial opinion guided only by the desire to save human life. But to do this in a really imposing manner everyone should hear and understand all the arguments brought forward, no matter what be the language in which they are presented to the congress. Then the principal arguments and the results in regard to these practical and legislative proposals should be made widely known by the popular press. The general elector will not read the official reports of the congress but he does read a daily paper. The mission of the congress is twofold. It is purely scientific in its first three or four sections, but the other sections are constantly dealing with practical, social, and legislative problems.

To turn to another perhaps less important matter, there is the question of excursions. In Paris the support of the general press in the campaign against tuberculosis was so welcome that the newspapers were encouraged to help in every way. It will be remembered that the *Matin* organised the gala representation at the Châtelet Theatre, the *Figaro* gave a grand fête at its offices, and it was *Le Journal* that managed the notable excursion all the way to the Riviera and Monaco. One or two special trains were retained for each of the excursions which were organised by the congress. The farthest was to the Pyrenees. Then there were special trains for Montigny, near Douai, where M. Loubet, then President of the Republic and Honorary President of the Congress, accompanied by some 200 members, went to inaugurate a new sanatorium. On the same day—it was the Thursday of the week—100 members went to Berck-sur-Mer, another 100 to Bligny, and yet another equally numerous body to the sanatoriums of Villiers-sur-Marne, Ormesson, and Noisy-le-Grand. By having all the excursions on the same day each body of excursionists was kept within reasonable limits as to numbers, so that they were easily and well entertained at each place visited. Though the members paid for these journeys the sum was much less than the ordinary railway fare would have been and they enjoyed the luxury of first-class corridor trains which correspond to the American Pullman cars.

Consequently, members attending international congresses want to know what excursions there will be, when they are to take place, how long they will last, and what they will cost. The organisers of the congress, on their side, would like to know how many are coming before making their plans. But this is a vicious circle; no one will promise to come before knowing what will be done on arriving. The foreign committees have repeatedly asked the organisers at Washington what excursions and entertainments are to take place. On the other hand, the Washington committee has been persistently asking the national committees how many members they were going to send over. But the national committees can only send the names of those who have promised to go and many persons will not make up their minds till they see the programme. To-day, however, and even if a satisfactory programme were now issued and proved attractive to those who have hesitated to go, it would not be of much service. It is quite certain that only very few could at this late hour find berths on the steamers which, as already pointed out, are more crowded in September than in any other month of the year.[1] Therefore, and so far as Europe is concerned, the committee of management at Washington may be certain that there will not be many more members than those already announced.

According to the latest news from Washington it appears that the members of the congress are to be entertained at Philadelphia on Sept. 24th and 25th, in Washington during the week following, in Baltimore on Oct. 5th, in Boston on the 6th and 7th, and in New York on the 8th and 9th. It seems hardly conceivable that the entire congress will proceed to these towns or that it will be possible to lodge the members when they get there. On the other hand, no information is as yet forthcoming as to the basis on which a selection will be made. Then there are to be excursions from New York to the sanatoriums at Saranac and Liberty, which are in the northern part of the State of New York. But no details are as yet given. Further, I am informed that some French members of the congress will go to Canada for a considerable time before the congress meets, and they are to be entertained at Boston on Sept. 20th. It is to be hoped there will be efficient which are now identified with his name, cannot be reflected, refracted, or polarised, and also that they have the power of penetrating many solid substances, also of ionising gases through which they pass, and of producing fluorescence when they impinge upon screens prepared with such materials as zinc sulphide and barium platinocyanide. These researches were the dawn to the discovery of radium and of the radio-active properties of several bodies. France mourns the loss, at the comparatively early age of 56 years, of such a promising student of nature's laws and phenomena, and England will sincerely share her grief.

---

[1] THE LANCET, July 25th, 1908, p. 252.

UNTOWARD EFFECTS FOLLOWING THE INJECTION OF ANTITOXIN.

ERYTHEMATOUS and urticarial rashes and arthritis are well-known consequences which sometimes follow the injection of antitoxin in diphtheria. They are due not to the antitoxin but to the horse serum in which it is contained. Rarer and more serious consequences—syncope and even sudden death—have been described. Among the fatal cases the best known is that of Professor Langherans's child. In another case reported by Escherich, a fine boy, aged 11 months, was seized with laryngitis, and as a precautionary measure antitoxin was injected. He died a few hours later with sudden failure of the heart. In both these cases no morbid condition was found except an enlarged thymus. As this condition is one of the signs of the lymphatic state in which children are liable to sudden death there is some doubt whether the fatalities should not be ascribed to it rather than to the antitoxin. Antitoxin is almost invariably a perfectly safe remedy, but the possibility of these serious effects should not be overlooked. In the *Journal of the American Medical Association* a remarkable series of cases in which they occurred has been recorded during the present year. In three sudden death took place. The following case is recorded in the issue of Feb. 8th by Dr. E. L. Boone. A well-developed, apparently strong boy came under observation on August 30th, 1907, the second day of an attack of sore-throat. His temperature was 102° F. and the pulse 110, and there was a little membrane in the pharynx. A mild attack of diphtheria was diagnosed and 4000 units of antitoxin, marked "good until Feburary, 1908." were injected below the scapula. The boy was lying on his face and did not even cry out when the needle was inserted. As Dr. Boone turned away and laid down the syringe the boy gave a loud cry of distress and sat up in bed catching at his throat with both hands and giving a choking cough or two. He cried out that his head hurt him and that he could not breathe and continued to clutch at his throat. In a few seconds his face became cyanosed, his pupils dilated, and his eyes were staring. Froth ran from his mouth and there was occasionally a harsh, brassy cough with a peculiar cry. A convulsion occurred and the respiration stopped, but the heart continued to beat for some time. Stimulants were administered hypodermically and artificial respiration was performed until death, which occurred five or six minutes after the injection of the antitoxin. Two cases of collapse are also reported. The following one is recorded in the issue of July 4th by Dr. F. W. Thomas. A boy, aged 15 years, who had always been healthy, had a large mass of diphtheritic membrane in the pharynx; the respirations were rapid, and the pulse was 120. 4000 units of antitoxin were injected. Immediately the countenance became anxious and the face and neck quickly became livid. The boy gasped for breath and cried out that he was being smothered and had a pain at his heart. Froth poured from his mouth and he clutched at his throat. In his eyes was a peculiar death-like stare and the pupils were widely dilated. Soon he went into convulsions, throwing himself from side to side of the bed. Finally, he dropped back unconscious, the pulse disappeared, and death seemed imminent. Heat was applied to the extremities, hot coffee was injected into the rectum, and strychnine, atropine, and nitroglycerine were given internally. After lying in this state for an hour and a half the throat was filling with membrane which threatened to cause suffocation. 3000 units of antitoxin were injected and an hour later 2000. Respiration was weak and rapid and the extremities were cold and blue. Three hours later respiration began to improve and a faint pulse could be detected for the first time for six hours. Consciousness was soon regained but there was much prostration. At 9 A.M. the next day 3000 units of antitoxin were given and the dose was repeated at 1.30 and 5.30 P.M., making in all 18,000 units administered in 22 hours. The improvement in the pulse and respiration became more noticeable, but the membrane did not begin to separate till the fourth day. On the eighth day there were severe muscular and articular pains and the characteristic eruption, and the eyes became bloodshot. Dr. Thomas gave further antitoxin in spite of the untoward effects of the first dose, because he thought the toxæmia of the disease so severe that recovery was impossible without such heroic measures. In an editorial article in the same journal this series of cases is discussed and it is pointed out that the symptoms are similar to those observed in animals infected with an alien serum in what is called the anaphylactic state—i.e., sensitised or rendered susceptible by previous injections of the serum. In sensitised guinea-pigs injections of horse serum are followed in five or ten minutes by dyspnœa, scratching at the mouth, paralysis, convulsions, and death. As the patients had not previously been treated with antitoxin it is suggested that they may have been sensitised by partaking of horseflesh (unwittingly) or even by some other food. We may suggest that the dangerous symptoms may have been due to the injection of some of the serum into a vein—a recognised danger of hypodermic injections. In favour of this are the immediate production of the symptoms and the fact that no symptoms were produced by further injections.

THE RÔLE OF THE PHYSICIAN IN SCHOOLS FOR MENTALLY DEFECTIVE CHILDREN.

AUXILIARY schools for the training of mentally defective or weakly endowed children were first established in Germany but they are now found in most European countries and in the United States. An interesting bulletin, consisting of a translation of a course of lectures on the auxiliary schools of Germany by Dr. B. Maennel, has been issued by the United States Bureau of Education.[1] The bulletin gives the reasons for the establishment of such schools and the conditions under which they are conducted. The physical development of the children as well as the hygienic conditions in the school are inquired into by the school physician. He makes a physical examination every three months, recording the results on a printed form which accompanies the child from class to class until he leaves the school. If a child needs special medical treatment the principal is notified of the fact and the parents are informed by a printed notice that the child should be placed at once under the care of a physician or sent to a polyclinic. The health report calls for particulars as to general constitution; height, weight, and chest measurement; difficulty of speech (if present); the condition of the mouth, nose, teeth, eyes and ears, breast, abdomen, spinal column, and extremities; the presence or otherwise of skin diseases or parasites; and as to signs of disease. Columns are also provided for the general comments of between the last-named date and July 26th (August 8th) 262 cases and 125 deaths. This would bring the totals from the beginning down to August 8th (New Style) to 360 cases with 172 deaths. It is probable that these figures are somewhat less than the actual numbers.

---

[1] Bulletin No. 376, Bureau of Education, Washington, D.C., pp. 137.

In consequence of this serious extension of cholera in Southern Russia the Constantinople Board of Health has imposed the following measures on arrivals from Russian ports. Persons arriving from any port on the Black Sea and Sea of Azof situated between Sulina (excluded) and Batum (included) will be subjected to a medical visit, and the effects of third-class passengers and crews will be disinfected. These measures will be applied "facultatively" in the lazaret of Sinope or in that of Monastyr Aghzi (at the mouth of the Bosphorus). Arrivals from Rostof, Taganrog, Novorossiisk, and Batum will be subject to five days' quarantine and disinfection, to be applied in the Sinope lazaret; passengers from these ports will further be liable to five days' surveillance in their place of destination. The importation of the following objects from Russia to Turkey is prohibited: caviare, fish (fresh, smoked, or salted), soiled body linen and clothes (imported as merchandise), bedding and furniture that have been used, rags, old papers and journals, carpets and embroideries that have been in use, old sacks and baskets, fresh animal products, hoofs, claws, horsehair, down, raw silks and wool, raw hides, untanned skins, and fresh skins.

Pilgrim ships from any Russian ports in the Black Sea will be subjected to five days' quarantine, disinfection, and rat destruction, to be applied in the Sinope lazaret; the five days will begin to count only from the moment when the disinfection process is completed. Such ships will pass through the Bosphorus and Dardanelles in quarantine; their pilgrims will not be allowed to land anywhere before reaching the Hedjaz; they will go straight to the Abn-Saad lazaret, near Jeddah. The ships may, however, take in water, coals, provisions, and other pilgrims in the lazarets of Monastyr Aghzi, Clazomene (Smyrna), and Beirût. Ships with more than 1 per cent. of pilgrims on board (calculated on their registered tonnage) will be treated as pilgrim ships. Ships with large numbers of emigrants or similar masses will be subject to the same measures as pilgrim ships in the Sinope lazaret. Finally, it may be noted that the Alexandria Quarantine Board has prohibited pilgrims from Russia, Turkey, and the Balkan countries from landing in Egypt; they must pass the Suez Canal in quarantine. This decision has caused some dissatisfaction here, as Turkey and the Balkan countries are so far entirely free from cholera or other disease.

Constantinople, August 20th.

BIRMINGHAM.

(FROM OUR OWN CORRESPONDENT.)

The University and the Working Classes.

THE University course of Social Study Lectures, which was promoted in the interests of the working classes, has proved so successful that an attempt is being made to develop and to extend it and to establish a workers' college. As a preliminary to a more ambitious attempt the University has placed at the disposal of the Workers' Education Association a lecture-room, a reading-room, and a library. The object is to popularise definite and serious study and to encourage discussion and social intercourse. Any working man or woman may become a member and it is hoped that each student will pursue a systematic course of reading and write exercises or essays. The subjects proposed for the coming term include economics, industrial conditions, law for social workers, British institutions, and sanitation and hygiene. The lectures upon sanitation and hygiene are to be delivered by Dr. John Robertson and from a medical point of view are of the greatest importance, for by their means a knowledge of the essentials of healthy life may gradually be scattered amongst the people.

The Health of the City.

Dr. Robertson's report upon the quarter ending June 27th last repeats the tale with which we are getting so familiar —a low and decreasing death-rate and a still more rapidly falling birth-rate. The death-rate was 14·8 per 1000, that being a record for the second quarter. The birth-rate was 28·4 per 1000, which contrasts badly with the average of 31·9 for the past ten years. Measles was decidedly less prevalent than in the same quarter last year and was responsible for only six deaths, whilst in 1907 it proved fatal in 155 cases. Whooping-cough, on the contrary, was decidedly more prevalent and more fatal, resulting in 119 deaths, as against 62 in the same quarter of the previous year. The results as regards scarlet fever, enteric fever, and tubercle were not greatly different from those of the same quarter of 1907, except that the enteric fever was of a somewhat virulent type, but the number of cases of diphtheria (161) was decidedly less than in the same period of 1907, when 245 cases were notified.

West Bromwich District Hospital.

The financial report presented at the annual meeting of the governors of the West Bromwich District Hospital must be the cause of serious concern to all well-wishers of the hospital, for it reveals a deficiency account of £1766 as contrasted with £1217 in the previous year. Some reference was made to abuse of the out-patient department, especially by people who claimed that they subscribed to the institution through the Hospital Saturday Fund, but the matter was dropped when it was stated that a conference was to be held to deal with the whole question of the out-patient department.

Sept. 1st.

MANCHESTER.

(FROM OUR OWN CORRESPONDENT.)

Ptomaine Poisoning.

THE repeated occurrence of attacks of illness, often fatal, from ptomaine poisoning after eating what has seemed to be perfectly wholesome food is a proof, if any were needed, that the subject is well deserving of the attention of those specially skilled in preventive medicine. At present the victims are helpless. There was an inquest the other week at Greenfield, near Saddleworth, on a boy aged 13 years. He was a member of a band which was playing at a cricket match. During an interval he and a companion went to a shop and bought a pie which the two ate between them. One died and the other was said to be in a dangerous condition. The medical man in attendance, Mr. G. Stonehouse, in giving evidence, said that others were suffering from ptomaine poisoning and that all his patients had eaten pies made by the same firm. He considered this disease to be a bacterial infection and that bacteria were still alive in the boy's body, because he was "breaking out in blotches." He believed the jelly in the pies was the peccant matter and that the recent hot weather would favour bacterial growth and development, while the putrefaction would not be perceptible to taste or smell. The maker of the pies deposed that they were made on the Thursday afternoon, that he and other employees partook of them, and that none of them were affected. "The pies were jellied after being made, the jelly being made from bones and cowheels." It does not appear whether the pies were eaten by the maker and his workpeople before or after being "jellied." Bones may be fresh or otherwise and cowheels likewise, but the jury, after giving the verdict of ptomaine poisoning, added that no blame attached to the makers of the pies. A woman ate part of a pie on August 1st; she was taken ill and died after a few days' illness. Tinned salmon was the cause of illness in a boy living near Burnley and possibly caused the death of his father, for after eating some of the salmon he went to bed and was found dead the next day. At Hanley a verdict of "Death from ptomaine poisoning from eating pork" was returned on August 7th. A young man, aged 26 years, was taken ill after eating a pork chop for his dinner and died in hospital. Mr. J. M. Longford, in his evidence, said that pork and shell-fish were peculiarly liable to contain "ptomaine poison in hot weather." On August 24th an inquest was held at Mossley on a case of suspected ptomaine poisoning. A woman about a fortnight before her death had some potted meat. She was seen some days afterwards by Dr. A. W. Harrison who suspected poisoning and said that the whole of the symptoms pointed to bacterial infection. He was of opinion that septic pneumonia from which she died was caused by something that infective material reaches these situations is by means of "exudation" from the throat of a diseased bird "coughed" out on to the plumage of a neighbouring healthy bird which subsequently takes up the bacilli during the process of preening itself, or by the ingestion of infected food (e.g., an acorn) previously regurgitated from the gullet of an infected bird. Altogether the report is an excellent piece of work, and leads us to hope that if opportunity offers *British Birds* will continue an investigation which has already yielded such interesting results.

THE WORKING OF THE MIDWIVES ACT IN MANCHESTER DURING 1907.

THE report of the Manchester Midwives Supervising Committee to the City Council of the work done by its officials under the Midwives Act, 1902, during the year 1907 contains a great deal of interesting information. In his annual statement the medical officer of health, Dr. J. Niven, calls attention to the good work done by the executive officer, Dr. Margaret Merry Smith, and points out that the work of supervision, excellent as it is, does not and cannot cover the whole ground. As he remarks, the investigation of stillbirths and the investigation of cases in which the midwife has called in medical aid for other conditions than puerperal fever offers a field of useful work which has not yet been cultivated. A letter was addressed by the supervising committee to the Lord President of the Privy Council representing the necessity for requiring that a midwife should at every visit take the temperature of the lying-in woman, and the advisability of the inclusion of a rule to that effect in the revised rules of the Central Midwives Board. No such rule was inserted, possibly because the Board doubted the feasibility of its being properly carried out at the present time, but the following resolution was sent to the various local supervising authorities, calling their attention to the importance of instructing and encouraging midwives practising within their area in taking and recording regularly the pulse and temperature of the lying-in woman in every case under their care. The report of Dr. Smith notes that the improvement shown in 1906 in all departments of the work has been fully maintained. The addresses and demonstrations provided for the midwives were well attended and a further series of the same kind is now being given. 11,128 women were attended by midwives in Manchester during the year 1907, or more than half the total number of cases of labour. The influence of the midwives in the prevention of infantile mortality, as Dr. Smith points out, must be great, and she records with pleasure that a very good response was made by them when a scheme for the voluntary notification of live births was initiated in the city in December, 1906. By this means the health visitor for the district is able to visit the child as soon as possible after the tenth day and to keep him or her under observation. Of the 153 midwives who announced their intention to practise in Manchester during the year 1907 three were struck off the roll. Of these one still appears to attend a large number of lying-in cases, and as she works in a district where there is no health visitor there is little control over her work. 94 cases of puerperal fever were notified and 20 of these ended fatally. The report contains full particulars of the work done in supervising the midwives and several useful tables are given showing the total number of midwives practising and giving particulars as to their qualifications, the birth-rate and the number of cases of puerperal fever, the number of instances in which a midwife called in a medical practitioner, and the reasons for doing so, and the total number of stillbirths. The difficulties which are likely to arise in future years in providing a sufficient number of midwives is called attention to by Dr. Smith who points out that the difficulty lies largely in the fact "that the people themselves prefer to employ the midwife who is easy-going as regards payment and cleanliness, and refuse to employ the more highly trained and competent women who insist on the provision of clean garments and require the recognised fee for her attendance." This aspect of the matter is too often overlooked by those who write on the question of the provision of midwives. Dr. A. Knyvett Gordon's report on the treatment of the cases of puerperal fever admitted into the Monsall Fever Hospital is most interesting. 49 cases in all were admitted, with a total mortality of 12, or 24·4 per cent. The average interval of time which elapsed between the calling in of the medical man by the midwife or the admission of the patient into the hospital was four and a half days. Dr. Gordon considers that the incubation period of puerperal fever is probably 48 hours, and as in 15 of the 23 cases attended by a medical man a longer period than this elapsed before the onset of symptoms he considers that the medical man is possibly not to blame for the infection but that it may well have been due to the nurse. In the cases attended by midwives the average day on which the onset of the symptoms occurred was the fourth, and therefore, according to the author of the report, the bulk of the cases admitted to the hospital were not instances where the infection occurred at the time of delivery. Dr. Gordon believes that this is true of cases of puerperal fever generally. When we consider, however, the considerable limits of time within which the incubation period of nearly all the acute infectious diseases, or, indeed, of practically any disease of this type, may be compassed it seems hardly likely that that of puerperal fever has such a short and definite duration as Dr. Gordon would wish to assign to it, and we doubt whether the deductions founded by him on this assumption will be borne out by future observations. In 27 of the cases a pure cultivation of the streptococcus was found present in the uterus and in five cases it was present with other organisms. In all but four of the cases the uterus was curetted on the admission of the patient to the hospital with a sharp curette followed by the application to the raw surface of undiluted izal fluid. The mortality of these cases was 22 per cent. Dr. Gordon is of opinion that curetting does good in these cases since in 79 cases treated on general lines without curetting 37 died, or 46 per cent., while the curetted cases have shown a steady mortality of about 24 per cent.—a figure which we are inclined to believe is equal to, if not slightly greater than, the normal mortality of the disease when large numbers of cases are considered. Polyvalent antistreptococcic serum was administered in seven cases in doses of 100 cubic centimetres. Dr. Gordon considers that antistreptococcic serum is only likely to be of value in cases where the general infection is severe and the local lesion slight. Stress is laid upon the great importance of modified open-air treatment, good nursing, and the need for prolonged after-care in these cases. These reports are of great value and interest and show how well this important work is being carried out in Manchester.

TRAUMATIC FOCAL TELANGIECTASIS OF A TENDON.

IN the *Boston Medical and Surgical Journal* of July 16th Dr. A. T. Legg has reported a case of a rare condition—traumatic focal telangiectasis of a tendon. A single woman, aged 33 years, went to hospital with the history of having sprained her ankle five years previously. After this she occasionally felt pain and stiffness in the ankle, especially in the morning, which disappeared after walking. During the last year the pain and stiffness were constant. There were marked tenderness below and behind the external malleolus and slight thickening along the course of the esults entail an indirect expense on the owners which more han balances any apparent saving.

Overcrowding in the County of Durham.

The conditions under which people live in the area under his control is evidently a source of serious concern to Dr. Hill. In spite of the large number of new dwellings erected during 1906 the "gross overcrowding" was apparently in no way relieved. In many of the district officers' reports reference is made to the overcrowding in houses and also to the necessity for improving the housing conditions. The medical officer of health of Chester-le-Street calls attention to the fact that some of the new houses erected in one of his districts did not contain the required accommodation for a working man's family, and he expresses the opinion that legislation should be introduced to deal with the floor space of rooms in order to prevent restriction in their area. In consequence of a representation by the county council as to the insanitary condition of a large number of back-to-back houses in one part of the county, the Local Government Board caused an inspection to be made by one of its medical inspectors, but his report had not been received at the time of writing. The county council has itself had, "after vainly endeavouring to induce the local authority to adopt Part III. of the Housing Act and erect workmen's dwellings, and having failed also in their efforts to persuade the owners of collieries to provide the necessary dwellings for their workmen," to carry out a scheme for the erection of workmen's dwellings. The results of this apparently serious condition of overcrowding in the county of Durham are to be found indicated in Dr. Hill's annual report. Thus, among the "chief causes" of the high rate of infant mortality Dr. Hill puts first the "gross overcrowding of dwellings which exists." Speaking of diarrhœa, he says "it is, unfortunately, a fact that however careful a mother may be it is impossible to insure healthy infant life in many of the dwellings in our industrial districts"; and in another place, "the ill-effects of improper feeding, bad housing, and the pollution of the soil and air about dwellings are certain to manifest themselves in a high diarrhœa death-rate." The provision of adequate hospital accommodation and the more frequent use of that already provided are urged, on the ground that it is quite impossible effectually to isolate cases of scarlet fever, or, as a matter of fact, any cases of infectious disease in a large proportion of the dwellings in the industrial districts of this county. Again, under the head of phthisis and tuberculosis it is reported that the death-rate from phthisis in rural districts was only 0·97, but in the urban districts 1·19. "Nearly all phthisical patients benefit considerably as a result of sanatorium treatment, but, unfortunately, the patient on leaving the sanatorium has often to return to home or industrial conditions where it is impossible to continue the essentials of sanatorium treatment and a relapse occurs. If proper housing and suitable employment could be secured for phthisical patients on their leaving sanatoria a very much larger proportion would be permanently benefited."

The Causes and Control of Infectious Diseases in the County of Durham (1906).

The control of infectious diseases is one of the main responsibilities of the medical officer of health. Every year adds something to our knowledge of epidemiology, and perhaps the most interesting fact which has recently come to light in this connexion is the so-called "carrier," the person, that is to say, who either does not suffer from the disease himself or contracts merely a mild form of the disease in virtue of his own immunity or partial immunity to that particular organism is, nevertheless, able to carry it from the infected to the healthy, or who, having recovered from an attack of a specific disease, harbours the organism in his body for long periods of time and so may be an unsuspected source of possible danger to others for very long periods of time. The existence of "carriers" is fully recognised by Dr. Hill in the references in his annual report to the infectious diseases. In connexion with diphtheria he expresses his regret that it is unfortunate that medical practitioners do not make more use of the facilities granted by the county council for bacteriological examination of material from suspected cases of the disease, and records his opinion that it is certainly desirable that in the case of children who have suffered from diphtheria a bacteriological examination of the throat should be made after all symptoms have disappeared and before they are permitted to return to school. Besides these unrecognised mild cases of the disease and still infectious convalescents certain other possible causes of the spread of the disease are mentioned. Of these, the attendance at school of ailing children or children from infected houses is important. Some local medical officers complain that pressure is used by the education authority to force such children to attend school in order to keep up school attendance averages. And while in the general opinion direct infection at school and in the home was the chief cause of the prevalence of diphtheria, in Durham itself the increased prevalence was attributed to the new sewerage scheme involving the "disturbance of the soil about dwellings." Scarlet fever "now inspires no dread in the majority of our working-class population," and that on account of the very mildness of the type of disease at present prevailing. The parents are therefore careless about the isolation of children suffering from the disease and to this and to "mild unnotified" cases the spread of the disease is attributed. Enteric fever has been steadily and rapidly increasing in the county of Durham during the last five years, 674 cases in 1902 and 1090 cases in 1906. One epidemic in 1906 was clearly traced to the milk-supply from a dairy farm which was dependent for its water-supply on a grossly polluted and badly constructed shallow well. In another outbreak there was evidence of some mild unrecognised cases of the disease having occurred and, as a result, specific pollution of conveniences and probably of the drains and sewers. In other places where the disease was prevalent the infection was attributed to defects of drainage and insanitary conveniences, possibly infected by unrecognised cases and, in a few cases, direct infection is stated to have been the cause of the spread of the disease. With regard to tuberculous diseases, voluntary notification in the places where it had been in force was most unsatisfactory. Commenting on the value of sanatorium treatment, Dr. Hill says that it is now generally recognised that as a rule a permanent cure can only be effected when the disease is dealt with in an early stage, but that there is very little doubt that, in all cases, sanatorium treatment prolongs the life of a patient and is of educational value. One district has decided to utilise its small-pox hospital for the reception of advanced cases of pulmonary tuberculosis on preventive rather than on curative grounds. On the subject of milk and tuberculosis Dr. Hill states that now that it has been proved that tuberculosis in the cow and the human subject is one and the same disease the necessity for the early detection of tuberculosis in the cow is evident, and it is therefore desirable that periodical veterinary inspection of all milch cows should be enforced. In many districts the purity of the milk-supply and the means necessary to insure it receive but little attention.

Sept. 1st.

WALES AND WESTERN COUNTIES NOTES.

(FROM OUR OWN CORRESPONDENT.)

Cardiff Infirmary.

IN the supplementary report of the board of management of the Cardiff Infirmary for 1906 it was pointed out that there was urgent need for increasing the number of beds in the institution and it was suggested that a new pavilion should be erected, with accommodation for 64 patients, together with a six-bed ward to be used for isolating any cases of infectious disease which might inadvertently gain admission to the infirmary. The estimated cost (£30,000) of this additional building has already been subscribed and the committee is now met with the problem of maintaining the beds when the pavilion is completed. The total income during 1907 from all sources was £11,486 and the expenditure amounted to £14,190, and it is estimated that after about two years from now the expenditure will reach some £18,000 annually. Very generous response has been made to the appeal for further subscriptions. Mr. John Cory, who is already an ardent supporter of the infirmary, has offered to give a sum equal to 25 per cent. of all additions made to the subscription list. Mrs. John Nixon has given 10,000 guineas to endow ten beds. Mr. Henry Webb has endowed three beds, and one bed has been provided for with a donation of 1000 ophthalmology, radiography, anatomy, nervous diseases, microscopy, urinary analysis, gynæcology, practical bacteriology, mental diseases, hygiene and public health, and operative surgery. Extra classes in any subject are formed to suit the convenience of practitioners unable to attend those already provided. Special tutorial classes are held for practitioners reading for the higher examinations. A complimentary ticket available for three successive days will be issued to any practioner upon presentation of his visiting card. A monthly journal, the *Polyclinic*, recording the work done in the college, is issued free to subscribers and members. The annual subscription for medical practitioners of either sex, holding qualifications granted in any British dominion, is 1 guinea. Full information can be obtained from the medical superintendent at the college, 22, Chenies-street, Gower-street, W.C. The autumn session will commence on Monday, Sept. 14th.

The Hospitals of the Seamen's Society.—In connexion with these hospitals there are two post-graduate schools—viz., (*a*) the London School of Tropical Medicine; and (*b*) the London School of Clinical Medicine.

(*a*) *The London School of Tropical Medicine.*—The school buildings, laboratories, museum, library, &c., are within the grounds of the Branch Hospital Royal Victoria and Albert Dock (Station, Connaught-road, Great Eastern Railway). Opportunities are afforded to students and others who may be desirous of studying diseases incidental to tropical climates before entering the service or going abroad. In the hospitals of the society are to be found cases of tropical diseases such as may be met with in actual practice in the tropics. There are three courses in the year, each lasting three months, beginning on Oct. 1st, Jan. 15th, and May 1st respectively. The laboratory, museum, library, &c., are open daily and clinical instruction is given daily in the wards of the hospitals. The School Course is recognised by the University of Cambridge for its Diploma of Tropical Medicine and Hygiene. Classes are arranged for advanced Helminthology, Protozoology, and Entomology. The lecturers in the School are: Sir P. Manson, F.R.S., Dr. Andrew Duncan, Dr. L. Westenra Sambon, Dr. J. M. H. Macleod, Professor R. Tanner Hewlett, Mr. James Cantlie, Mr. E. Treacher Collins, Dr. F. M. Sandwith, Mr. K. W. Goadby, and Professor W. J. Simpson. The Director is Dr. C. W. Daniels. Certificates are granted after examination to those who complete a full course. Resident chambers are available for students who must be qualified or in the fifth year of their medical studies. Prize: the Craggs prize of £50 is awarded yearly.

(*b*) *The London School of Clinical Medicine* (for qualified practitioners only).—The lecture rooms, pathological laboratories (two), museum, and operative surgery class-rooms, are in the *Dreadnought* Hospital at Greenwich, and the whole hospital of 250 beds with its Out-patient Departments is open to students from 10 A.M. till 5 P.M. Medical, Surgical, and Special Department In-patient Cliniques are held upon every afternoon except Saturday by the senior members of the staff and operations are performed daily, whilst out-patients in the Medical, Surgical, and Special Departments are demonstrated by the assistant physicians and assistant surgeons daily in the forenoon. Practical classes are arranged each session in the following subjects: The Practice of Medicine; the Practice of Surgery; Diseases of the Eye; Diseases of the Throat, Nose, and Ear; Diseases of the Skin; Diseases of the Nervous System; Operative Surgery; Clinical Pathology, Microscopy, and Bacteriology; Mental Diseases; Radiography; Dental Surgery; the Administration of Anæsthetics: Hygiene and Public Health; Gynæcology; Surgical Diseases of Women; Surgical Diseases of Children; Medical Diseases of Women; Medical Diseases of Children; Applied Anatomy; and Midwifery. Three sessions of three months' duration are held in each year, beginning on Jan. 15th, May 1st, and Oct. 1st. Every variety of disease may be studied in the wards and out-patient rooms of the hospital, at the dispensaries, and at the affiliated hospitals. Male patients chiefly are received as in-patients by the Seamen's Society, but arrangements have been entered into with the Royal Waterloo Hospital for the reception of graduates who desire instruction in diseases of women and children; with the Bethlem Hospital for those who require tuition in mental diseases; and with the General Lying-in Hospital, York-road, for the prosecution of study in midwifery. These hospitals are situated on the south side of the river, are directly linked to the *Dreadnought* by both railway and tramway, and are affiliated to the London School of Clinical Medicine. The certificates of the school are recognised by the Admiralty, the War Office, and the University of London (for the higher degrees). The supply of material affords exceptional facilities for practical instruction in operative surgery and in pathology on the cadaver. The hospital also offers a wide field for the study of venereal diseases and there is a special department with open-air wards for the treatment of tuberculosis. The teaching staff consists of: Sir Dyce Duckworth, Dr. Frederick Taylor, Dr. J. Rose Bradford, F.R.S., Professor R. Tanner Hewlett, Dr. Guthrie Rankin, Sir William H. Bennett, Mr. Albert Carless, Mr. William Turner, Mr. Lawrie H. McGavin, Mr. L. Vernon Cargill, Sir Malcolm Morris, Mr. L. A. Lawrence, Dr. James Mackenzie Davidson, Dr. S. Russell Wells, Dr. T. Lewis, Dr. D. W. Carmalt Jones, Mr. E. Rock Carling, Mr. C. C. Choyce, Mr. Lawrence Jones, Mr. R. Bickerton, Dr. Wilfrid Fox, Mr. G. N. Biggs, Dr. Maynard Horne, Dr. Cecil Hughes, Dr. Vivian B. Orr, and Dr. R. E. Delbruck. The extra-mural lecturers are: Dr. James Taylor, Dr. W. H. B. Stoddart, Professor W. J. R. Simpson, Mr. James Cantlie, Dr. William J. Gow, Dr. Herbert Williamson, Mr. Russell Howard, Mr. Herbert S. Pendlebury, Dr. Alexander Haig, Dr. Robert O. Moon, Dr. Charles O. Hawthorne, Dr. Thomas D. Lister, Dr. William R. Dakin, Dr. Robert Boxall, and Mr. C. C. Choyce, Dean.

The prospectuses, syllabuses, and other particulars of both schools can be obtained on application to the Secretary, Seamen's Hospital, Greenwich, S.E., or from the Deans at the associated Schools.

West London Post-Graduate College, West London Hospital.—The West London Post-Graduate College was started in 1895 and three years later its basis was enlarged by the provision for the post-graduates of lecture-, reading-, and waiting-rooms, &c., while owing to the continued growth of the college these were transferred in 1901 to a building especially constructed for the purpose. Over 1300 post-graduates have been enrolled since its establishment, the yearly entry being now about 200. The hospital, which contains 160 beds, is in the main Hammersmith-road, about three miles from Hyde Park Corner, and very accessible by omnibus, tram, or train. The physicians and surgeons attend daily at 2.30 P.M. Post-graduates accompany the staff and the junior staff on their visits to the wards. Instruction is given in the out-patient department daily at 2.15 P.M. by the assistant physicians and assistant surgeons. The out-patient department has recently been enlarged and there is now ample accommodation for post-graduates to see and to examine the patients in all the special departments of the hospital. Clinical assistants are appointed from among the post-graduates to the Medical and Surgical out-patients and the Special Departments. The fee for a clinical assistantship to non-members is £2 2*s*. for three months, which includes membership of the College on the days on which the clinical assistant attends. Practical classes, limited in number, for instruction in special subjects, as well as in medicine and surgery generally, are held as required. Operations are performed daily at 2.30 P.M. Post-graduates are allowed to stand close to the table and can see the operations perfectly. The surgeons often avail themselves of the assistance of post-graduates at operations. Instruction is given in the administration of anæsthetics by the anæsthetists on the operating days and post-graduates are allowed to administer anæsthetics under their superintendence. Post-mortem examinations are performed at 12 noon, and demonstrations on recent pathological specimens are given on Mondays at 12 noon during each session in the pathological laboratory. Also two demonstrations are given each week on Practical Medicine on Wednesdays and Fridays at 12.15 P.M. Practical lectures and demonstrations are given each afternoon (except Saturdays), at 5 P.M., during the session. Included in this course are lectures by outside specialists on Mental Diseases and on Public Health, and in connexion with the former instruction is also given in certain asylums. The college is licensed for the teaching of operative surgery. The fee is £4 4*s*. each member in a class of four. The practice of the hospital is well adapted to the needs of medical officers of the Royal Navy and officers of the Royal Army Medical Corps and Indian Medical Service who have peregrinations. A vote of thanks having been passed to the trustees Mr. P. J. O'Neill, J.P., chairman of the County Dublin County Council, and also chairman of the General Council of all the County Councils of Ireland, proposed, and Sir John Byers seconded, the following motion:—

> That this meeting heartily approves of the principles of the Tuberculosis Prevention (Ireland) Bill now before Parliament and earnestly desires to see it passed into law.

Mr. T. Laffan (Cashel) proposed, and Mr. J. Gernon (of the Wicklow urban council) seconded, an amendment:—

> That both the sanatorium proposals and those relating to notification in Mr. Birrell's Bill be deferred for further experience.

An interesting debate followed, in which the President of the Royal College of Surgeons in Ireland (Mr. J. Lentaigne), Mr. W. Byrne, veterinary surgeon, Roscommon, and Mr. T. W. Russell, M.P. (Vice-President of the Department of Agriculture) all spoke in favour of the Bill, while no one took the side of the amendment. Subsequently, on a direct appeal being made to Mr. Laffan by Mr. R. Hennessy, chairman of the Queenstown urban council, the amendment was withdrawn and the original motion as proposed by Mr. O'Neill and seconded by Sir John Byers was adopted with two dissentients. Sir Rubert Boyce, professor of pathology in the University of Liverpool, who happened to be present, was asked by Lady Aberdeen, as a member of the Royal Commission on Tuberculosis, to address the meeting. In the course of his speech he said that notification of tuberculosis went to the root of the whole matter and that unless notification were made early they could not proceed scientifically. As an Irishman he thanked Lady Aberdeen for the splendid way in which she had led a movement which must turn out to be of great benefit to the country.

The Belfast Health Commission.

The details of a draft report made by the joint public health, improvement, works, and market committee of the Belfast corporation upon the report of the Belfast Health Commission have been published. This joint committee was appointed in May by the Belfast city council, and the draft report—the greater portion of which has now been published in the *Northern Whig*—was the work of a small subcommittee. It has not yet been submitted to the health committee and it will, after that, have to be considered by the city council. If in its final state it takes the form of what has appeared in the *Northern Whig* it will not meet with general approval. It contains so many direct references, some anything but complimentary, to individuals (such as the Irish Registrar-General) and to bodies (the Belfast Citizens' Health Committee, the Local Government Board, the Belfast Water Board, and the Belfast board of guardians), as well as indirect references (as, for instance, to members of the Belfast Health Commission), that there is bound to be a series of replies, all of which will only tend to bring home more fully and more clearly the value of the criticism contained in the report of the Health Commission. The draft report exhibits a very slight acquaintance with modern preventive medicine, but it may serve one good purpose. The discussion which is sure to occur in reference to this action of the Belfast city council in an attempt to deal with the report of the Health Commission will have a most educating effect on the public at large.

Sept. 1st.

PARIS.

(FROM OUR OWN CORRESPONDENT.)

Alterations in the Examinations for the Post of Agrégé.

THE Minister of Public Instruction has recently modified the regulations which deal with the "degree" of *agrégé* in the Faculty of Medicine and the joint Faculty of Medicine and Pharmacy. The new regulations will not come into force until the commencement of the scholastic year 1909–1910. The qualifying examination consists of three sections: (1) anatomy, physiology, physics, chemistry, and natural science; (2) medicine; and (3) surgery and obstetrics. In the first and third sections special branches may be taken according to the particular branch to which the candidate has devoted himself. The maximum number of candidates who may be declared qualified (*admissible*) is decided by the Minister. The jury is composed of nine members chosen by the Minister from among the titular or honorary professors and the *agrégés*. No one faculty may have more than three members on the jury. The course of the examination is as follows: (1) A written essay in anatomy, physiology, and histology; (2) a *viva voce* examination lasting three-quarters of an hour in general pathology; (3) a clinical examination; and (4) an examination in practical pathological anatomy. Once a candidate has been declared qualified he maintains his position for life and all candidates who were qualified in examinations held previously to November, 1907, are dispensed from the above-mentioned examinations. For admission as *agrégé* the following tests have to be passed: 1. The candidate must hand in his testamurs and other documents (*titres*). 2. He must give a lecture of one hour's duration without an assistant or notes. Four hours are allowed for the preparation of this lecture. 3. Practical work. The judges in the various sections are appointed by the Minister from among the professors. Members of the Institute, of the Academy of Medicine, professors of the College of France, of the Museum, of the Faculty of Medicine, and of the joint Faculty of Medicine and Pharmacy can sit on the jury, but they can only have one place in any one section.

A Case of Sleeping Sickness, Spinal Form.

At a meeting of the Hospitals Medical Society held on July 3rd M. Hattan Larrier and M. Sézary showed a patient who had recovered from an attack of the spinal form of sleeping sickness. The disease had been contracted two years previously in the Congo. The first sign of illness was a mental affection. The paraplegia, of which there had been some signs in Africa, became marked a few days after the patient had arrived in France and was accompanied by muscular atrophy, diminished reflexes, sphincter troubles, Babinski's sign, and an ulcer over the sacrum. The thenar and hypothenar muscles of the hands were wasted, but there was no definite change in sensation. He was also very apathetic. Trypanosomata were found in the blood on examination during a febrile attack. Despite the very grave view of the case which was naturally taken both the paraplegia and the mental troubles disappeared under treatment by injections of atoxyl.

An Original Form of Strike.

The governing body of the hospital at Mans having refused to grant a demand which had been put forward by the *internes*, these latter went on strike and refused to attend to the patients or to assist at surgical operations. So matters went on for three days when the governors retaliated by stopping all supplies to the *internes*.

A Disgrace to the Profession.

The correctional tribune of Bordeaux has just sentenced Dr. X. to eight months' imprisonment, 100 francs fine, and disability to practise for four years. He had given bogus certificates under the Workmen's Compensation Act and had also sent in a preposterous bill for medical attendance. A druggist, M. Z., was also sentenced to five months' imprisonment and 100 francs fine for having, with the connivance of Dr. X., sent in a bill for drugs and dressings which were quite needless.

Dental Anæsthesia by Psycho-narcosis.

At the June meeting of the Society of Hypnology and Physiology M. Paul Farez read a paper on this subject. He said that most of the methods for bringing about anæsthesia or analgesia in dental extraction were insufficient or even dangerous. In his opinion narcosis was the best method—as, for instance, by ethyl chloride. The drawbacks are the shortness of the period of anæsthesia and the rigidity of the jaws which the drug produces. But if suggestion be employed as if the patient were in a hypnotic sleep the period of unconsciousness is prolonged and the rigidity of the jaws disappears. M. Farez brought forward figures in support of his contention and described his technique.

August 25th.

ophthalmology, radiography, anatomy, nervous diseases, microscopy, urinary analysis, gynæcology, practical bacteriology, mental diseases, hygiene and public health, and operative surgery. Extra classes in any subject are formed to suit the convenience of practitioners unable to attend those already provided. Special tutorial classes are held for practitioners reading for the higher examinations. A complimentary ticket available for three successive days will be issued to any practioner upon presentation of his visiting card. A monthly journal, the *Polyclinic*, recording the work done in the college, is issued free to subscribers and members. The annual subscription for medical practitioners of either sex, holding qualifications granted in any British dominion, is 1 guinea. Full information can be obtained from the medical superintendent at the college, 22, Chenies-street, Gower-street, W.C. The autumn session will commence on Monday, Sept. 14th.

The Hospitals of the Seamen's Society.—In connexion with these hospitals there are two post-graduate schools—viz., (*a*) the London School of Tropical Medicine; and (*b*) the London School of Clinical Medicine.

(*a*) *The London School of Tropical Medicine.*—The school buildings, laboratories, museum, library, &c., are within the grounds of the Branch Hospital Royal Victoria and Albert Dock (Station, Connaught-road, Great Eastern Railway). Opportunities are afforded to students and others who may be desirous of studying diseases incidental to tropical climates before entering the service or going abroad. In the hospitals of the society are to be found cases of tropical diseases such as may be met with in actual practice in the tropics. There are three courses in the year, each lasting three months, beginning on Oct. 1st, Jan. 15th, and May 1st respectively. The laboratory, museum, library, &c., are open daily and clinical instruction is given daily in the wards of the hospitals. The School Course is recognised by the University of Cambridge for its Diploma of Tropical Medicine and Hygiene. Classes are arranged for advanced Helminthology, Protozoology, and Entomology. The lecturers in the School are: Sir P. Manson, F.R.S., Dr. Andrew Duncan, Dr. L. Westenra Sambon, Dr. J. M. H. Macleod, Professor R. Tanner Hewlett, Mr. James Cantlie, Mr. E. Treacher Collins, Dr. F. M. Sandwith, Mr. K. W. Goadby, and Professor W. J. Simpson. The Director is Dr. C. W. Daniels. Certificates are granted after examination to those who complete a full course. Resident chambers are available for students who must be qualified or in the fifth year of their medical studies. Prize: the Craggs prize of £50 is awarded yearly.

(*b*) *The London School of Clinical Medicine* (for qualified practitioners only).—The lecture rooms, pathological laboratories (two), museum, and operative surgery class-rooms, are in the *Dreadnought* Hospital at Greenwich, and the whole hospital of 250 beds with its Out-patient Departments is open to students from 10 A.M. till 5 P.M. Medical, Surgical, and Special Department In-patient Cliniques are held upon every afternoon except Saturday by the senior members of the staff and operations are *performed daily*, whilst out-patients in the Medical, Surgical, and Special Departments are demonstrated by the assistant physicians and assistant surgeons daily in the *forenoon*. *Practical* classes are arranged each session in the following subjects: The Practice of Medicine; the Practice of Surgery; Diseases of the Eye; Diseases of the Throat, Nose, and Ear; Diseases of the Skin; Diseases of the Nervous System; Operative Surgery; Clinical Pathology, Microscopy, and Bacteriology; Mental Diseases; Radiography; Dental Surgery; the Administration of Anæsthetics: Hygiene and Public Health; Gynæcology; Surgical Diseases of Women; Surgical Diseases of Children; Medical Diseases of Women; Medical Diseases of Children; Applied Anatomy; and Midwifery. Three sessions of three months' duration are held in each year, beginning on Jan. 15th, May 1st, and Oct. 1st. Every variety of disease may be studied in the wards and out-patient rooms of the hospital, at the dispensaries, and at the affiliated hospitals. Male patients chiefly are received as in-patients by the Seamen's Society, but arrangements have been entered into with the Royal Waterloo Hospital for the reception of graduates who desire instruction in diseases of women and children; with the Bethlem Hospital for those who require tuition in mental diseases; and with the General Lying-in Hospital, York-road, for the prosecution of study in midwifery. These hospitals are situated on the south side of the river, are directly linked to the *Dreadnought* by both railway and tramway, and are affiliated to the London School of Clinical Medicine. The certificates of the school are recognised by the Admiralty, the War Office, and the University of London (for the higher degrees). The supply of material affords exceptional facilities for practical instruction in operative surgery and in pathology on the cadaver. The hospital also offers a wide field for the study of venereal diseases and there is a special department with open-air wards for the treatment of tuberculosis. The teaching staff consists of: Sir Dyce Duckworth, Dr. Frederick Taylor, Dr. J. Rose Bradford, F.R.S., Professor R. Tanner Hewlett, Dr. Guthrie Rankin, Sir William H. Bennett, Mr. Albert Carless, Mr. William Turner, Mr. Lawrie H. McGavin, Mr. L. Vernon Cargill, Sir Malcolm Morris, Mr. L. A. Lawrence, Dr. James Mackenzie Davidson, Dr. S. Russell Wells, Dr. T. Lewis, Dr. D. W. Carmalt Jones, Mr. E. Rock Carling, Mr. C. C. Choyce, Mr. Lawrence Jones, Mr. R. Bickerton, Dr. Wilfrid Fox, Mr. G. N. Biggs, Dr. Maynard Horne, Dr. Cecil Hughes, Dr. Vivian B. Orr, and Dr. R. E. Delbruck. The extra-mural lecturers are: Dr. James Taylor, Dr. W. H. B. Stoddart, Professor W. J. R. Simpson, Mr. James Cantlie, Dr. William J. Gow, Dr. Herbert Williamson, Mr. Russell Howard, Mr. Herbert S. Pendlebury, Dr. Alexander Haig, Dr. Robert O. Moon, Dr. Charles O. Hawthorne, Dr. Thomas D. Lister, Dr. William R. Dakin, Dr. Robert Boxall, and Mr. C. C. Choyce, Dean.

The prospectuses, syllabuses, and other particulars of both schools can be obtained on application to the Secretary, Seamen's Hospital, Greenwich, S.E., or from the Deans at the associated Schools.

West London Post-Graduate College, West London Hospital.—The West London Post-Graduate College was started in 1895 and three years later its basis was enlarged by the provision for the post-graduates of lecture-, reading-, and waiting-rooms, &c., while owing to the continued growth of the college these were transferred in 1901 to a building especially constructed for the purpose. Over 1300 post-graduates have been enrolled since its establishment, the yearly entry being now about 200. The hospital, which contains 160 beds, is in the main Hammersmith-road, about three miles from Hyde Park Corner, and very accessible by omnibus, tram, or train. The physicians and surgeons attend daily at 2.30 P.M. Post-graduates accompany the staff and the junior staff on their visits to the wards. Instruction is given in the out-patient department daily at 2.15 P.M. by the assistant physicians and assistant surgeons. The out-patient department has recently been enlarged and *there is now ample accommodation* for post-graduates to see and to examine the patients in all the special departments of the hospital. Clinical assistants are appointed from among the post-graduates to the Medical and Surgical out-patients and the Special Departments. *The fee for a clinical assistantship to non-members* is £2 2*s.* for three months, which includes membership of the College on the days on which the clinical assistant attends. Practical classes, limited in number, *for instruction* in special subjects, as well as in medicine and surgery generally, are held as required. Operations are performed daily at 2.30 P.M. Post-graduates are allowed to stand close to the table and can see the operations perfectly. The surgeons often avail themselves of the assistance of post-graduates at operations. Instruction is given in the administration of anæsthetics by the anæsthetists on the operating days and post-graduates are allowed to administer anæsthetics under their superintendence. Post-mortem examinations are performed at 12 noon, and demonstrations on *recent* pathological specimens are given on Mondays at 12 noon during each session in the pathological laboratory. Also two demonstrations are given each week on Practical Medicine on Wednesdays and Fridays at 12.15 P.M. Practical lectures and demonstrations are given each *afternoon* (except Saturdays), at 5 P.M., during the session. Included in this course are lectures by *outside* specialists on Mental Diseases and on Public Health, and in connexion with the former instruction is *also given* in certain asylums. The college is licensed for the *teaching* of operative surgery. The fee is £4 4*s. each* member in a class of four. The practice of the hospital is well adapted to the needs of medical officers of the Royal Navy and officers of the Royal Army Medical Corps and Indian Medical Service who have regards her as one of those not uncommon cases in which a hirsute development accompanies certain anomalies of the generative organs.

August 29th.

BUDAPEST.

(FROM OUR OWN CORRESPONDENT.)

The Physical Deterioration of the Bosnian and Herzegovinian Race.

THE experiences of Dr. Matosek, who spent several years in Bosnia and Herzegovina and had an opportunity to study the physical state of the people, seem to discredit the view that the progress of culture goes hand in hand with the physical deterioration of the race. He, as military surgeon, has attended the recruiting, thus having ample opportunity to study the youth of the country. The Bosnian people consists of Servian, Croatian, and Mahomedan people. The last are chiefly of Slav origin. The Bosnians have lived under very bad hygienic conditions. Infective diseases and tuberculosis have claimed many victims. The evil effects of alcoholism are also very noticeable, though not quite to the same extent as in years gone by. Out of every 100 recruits 62 have flattened skulls. This, it seems, is an artificial production, and is the outcome of the very tight dressing of the baby's head in the first months of life. The morbidity rate of the Bosnian soldiers is greater than that of the rest. Healing power is much worse and the mortality three times greater than with the rest of the soldiers. The number of those invalided from service is double that of regiments of other nationalities. Affections of the respiratory apparatus are twice as numerous, those of the digestive apparatus three times, and infective diseases six times as among the rest of the nationalities serving. There is a great disproportion between the stature and seemingly strong constitution and the low working capacity and poor resisting power against diseases. The Bosnian soldiers become prostrated in relatively slight diseases. The patients of the insanity department of the Vakuf Hospital in Sarajevo were in the last year affected with the following diseases: dementia paralytica (1·8 per cent.), paranoia (23 per cent.), secondary dementia (27 per cent.), melancholia (10 per cent.), mania (17 per cent.), alcoholic insanity (10·37 per cent.), and epileptic psychoses (5 per cent.). Among the Bosnians of the Vienna military hospitals there are about 51 per cent. hysterical or epileptical patients, an immense rate. The hysterical symptoms are very severe and often they occur epidemically. Other organic diseases and pains too frequently induce hysteria. Suicide is comparatively uncommon, the rate being 3·5 per 100,000, while in Germany the rate is 27·1 per 100,000, in France 18·7, and in Austria-Hungary 16·3. Among the Bosnian soldiers the percentage of suicide is 0·2 per cent., while it is 1·2 per cent. in the rest of the Austro-Hungarian army. Religious scruples are, in some respect, responsible for this low rate. Criminality is slight among the Bosnians. Out of 108 sentenced soldiers 35 had stolen something, the rest having offended against discipline. Dr. Matosek has sought for degenerative signs in 400 Bosnian soldiers. Apart from the lower portion of the auricle being deformed, which may be regarded as a racial property, three or more degenerative symptoms could be found in 16·5 per cent. of the cases. 7 per cent. of the men are left-handed. He concludes that the degeneration was of a greater degree here before civilisation set in, so it would be an exaggeration to say that culture as such is responsible, as a rule, for the physical deterioration of the races. Despite the great frequency of syphilis, psychoses and nervous diseases caused by syphilis are relatively very rare, perhaps because the disease is only 100 years old in the country.

Cancer of the Larynx; Laryngotomy; Relief of Symptoms.

Dr. Lenart recently exhibited a case to the Budapest Royal Medical Society with the following history. The patient, a man, aged 72 years, was admitted to his clinic on May 19th, 1905. He sought advice for hoarseness which had existed for eight years. The conditions found on examination were as follows. The right vocal cord was infiltrated, the surface was granulated, and the movements were limited. The surrounding parts were normal. Microscopical examination of an excised portion proved the presence of cancer. On these findings and on the clinical symptoms Dr. Lenart proposed to the patient a radical operation. On May 27th tracheotomy was performed. On June 8th an operation was performed with the application of Trendelenburg's cannula; incision of the skin in the middle line, free splitting of the thyroid cartilage and of the cricoid ligament, followed by the ligature of the cricoid artery; the larynx was opened from the wound with bone scissors. The application of adrenalin and cocaine was of service in stopping hæmorrhage, so giving a good view of the site of operation. Dr. Lenart successfully removed the diseased vocal cord. Afterwards the larynx and the soft parts were re-united, leaving a small opening. The patient was able to feed himself on the eighth day. In the fourth week the cannula was removed and the opening of the tracheotomy was united with a stitch. On the site of the removed cord there has formed what seems like an immoveable vocal cord. The patient, who is now 76 years of age, breathes freely; since the operation, performed three years ago, he has spoken with a tolerably good voice and has felt well in all respects.

A Case of Elephantiasis Penis et Præputii.

At the same meeting Dr. Steiner showed a patient, aged 48 years, who had acquired syphilis 27 years ago and had been treated with mercury inunctions. About one year ago his penis began to swell and then he smeared 100 grammes (about four ounces) of mercury ointment monthly on his penis for three months; under this ointment treatment the penis continually enlarged. The length of the penis in a relaxed state is 16 centimetres, the periphery being 15 centimetres; the skin is strikingly thickened and the prepuce cannot be pulled back. In the etiology of elephantiasis penis, said Dr. Steiner, chronic inflammations, recurring erysipelas, lymphangitis, tuberculosis, balanitis, and syphilis play the chief rôles. In this case the causal factors were on the one hand syphilis and on the other hand irritation produced by the application of the strong mercury ointment. The affection is rare even where elephantiasis occurs frequently. The prognosis is anything but favourable. In this case ablation of the prepuce and the cutting out of wedge-shaped flaps united with primary suture would be recommended.

August 28th.

NOTES FROM INDIA.

(FROM OUR OWN CORRESPONDENTS.)

Emigrant Indians.

THE care that is taken to prevent outbreaks of disease on emigrant ships carrying Indian coolies to the colonies keeps the mortality on board at a very low figure. From an official report it appears that in 1907 only 54 persons died at sea, or less than 1 per cent. Measles was chiefly responsible for this mortality, and in spite of the precautions taken before embarkation it seems impossible to prevent occasional outbreaks of this disease. On the return voyages the deaths among coolies are much higher, but this is accounted for by the fact that the people on board include a large number of chronic invalids and even lepers. A certain proportion also are lunatics, but in future these persons are not to be shipped back to India owing to the difficulties of looking after them at sea. The Natal authorities, however, consider that any further influx of Asiatics is undesirable, and hence the stringent regulations that are now being carried through the Assembly.

Ambulance Work in the Merchant Service.

Officers of the Mercantile Marine can now obtain their first-aid certificates through the centres which have been established under the Indian branch of the St. John Ambulance Association at Bombay, Calcutta, Madras, Rangoon, and Karachi. The Board of Trade now requires these officers to hold these certificates. The Bombay centre has fixed the maximum fee for instruction and examination in first-aid at Rs.15. 13 officers were examined in Bombay very recently.

Instruction in Army Hygiene.

Courses of not less than four lectures on the prevention of disease are being delivered to regimental officers, non-commissioned officers, and men at all stations where British advanced students and graduates. Applications for information should be made early in the year to Mr. E. E. Stubbing, Pathological Laboratory Museums, Downing-street, Cambridge.

Leeds.—The Anatomical, Physiological, and Pathological Laboratories at the University of Leeds are at the disposal of qualified medical men for research or for routine work at specially arranged fees and though there is no definite post-graduate course at the General Infirmary the work of the large teaching institution is very freely accessible to qualified medical men at reduced fees. For the past three years a course of post-graduate demonstrations has been held by members of the staff of the Leeds Public Dispensary. The course has been very well attended and it is now proposed somewhat to extend the scope of the work by offering short courses of from four to six demonstrations on special subjects and by arranging for a weekly demonstration of cases of an informal character. This arrangement will hold good for the winter, the usual course of demonstrations being held during the summer.

Liverpool.—At the University of Liverpool the department of Bio-chemistry is devoted entirely to post-graduate teaching and research upon chemistry in relationship to biology and medicine. The laboratory is open daily for research, and courses of laboratory instruction in those parts of the subject most closely related to medical work are given for medical practitioners by arrangement with Professor Benjamin Moore. The Thompson-Yates and the Johnston laboratories are open for post-graduate research in pathology and physiology during the winter and summer sessions, under the supervision of Professor Sir Rubert Boyce and Professor C. S. Sherrington. A course of lectures and practical work in the laboratory is given each term in comparative bacteriology and parasitology by Professor H. E. Annett who also conducts a course of lectures and demonstrations in comparative pathology during the summer term. In the department of Tropical Pathology special courses of laboratory instruction in bacteriology, parasitology, morbid histology, pathology, and medical entomology are given in each term, under the direction of Professor Ronald Ross, Dr. J. W. W. Stephens, and Mr. R. Newstead. A course of instruction in operative surgery is given by Mr. Thelwall Thomas on two days in the week during the summer session to candidates for the Fellowship of the Royal College of Surgeons of England and the higher university degrees in surgery. By special arrangement a practical course on the clinical examination of the blood, the staining and identification of pathogenic bacteria, and the bacteriological diagnosis of certain diseases is given twice weekly during the summer term by Dr. E. E. Glynn and Dr. W. B. Warrington. Three courses annually are given in tropical medicine and parasitology in the Liverpool School of Tropical Medicine in the University, and a Diploma in Tropical Medicine is granted. Post-graduate courses on diseases of the eye, skin, throat, and nose are also given during term time by the lecturers in those departments. At the Royal Infirmary special arrangements exist whereby medical practitioners can keep in touch with the most recent methods adopted in hospital practice.

Manchester.—The plan adopted a few years ago at the University of Manchester of having special courses of lectures on medicine and surgery for qualified medical men has since that time been considerably modified. Classes are now held and lectures given on various special subjects, as, e.g., diseases of the heart, diseases of the respiratory organs, of the kidney, and so on, and the same obtains as to surgical matters. These lectures are designed to meet the wants of senior students and practitioners. The Public Health Department, presided over by Professor S. Delépine, is largely attended by medical men, as are also the lectures on bacteriology given in the College course by Dr. E. J. Sidebotham. Facilities are also given for the pursuit of research work in the public health laboratories, and in this department the dates of post-graduate courses in pathology and bacteriology are announced in the laboratory, and in the medical journals. There is no difficulty in Manchester in the way of any practitioner who wants to have his recollections revived or his knowledge enlarged and brought up to the present standard in accomplishing his wish.

Newcastle-upon-Tyne.—At the University of Durham courses of instruction are given in chemical and physical laboratory work and lectures are delivered on comparative pathology and practical bacteriology for the Diploma in Public Health and the Degree of Bachelor in Hygiene.

Sheffield.—At the University of Sheffield post-graduate courses are held annually. The subjects vary from time to time and include medical and surgical anatomy, physiology of digestion and nutrition, pathology of the blood, clinical bacteriology, surgery, ophthalmic surgery, operative surgery, diseases of the nose, and diseases of the ear.

SCOTLAND.

Aberdeen.—Although there is no special provision at Aberdeen for post-graduate study such as exists in London, still there are some facilities for doing work of this nature at the University. There are fully equipped laboratories in anatomy, anthropometry, bacteriology, botany, chemistry, pharmacology, physics, physiology, public health, and zoology. Graduates or others desiring to engage in special study or research may be admitted by the Senatus to prosecute such study or research in any of the laboratories in accordance with certain provisions. Research students are exempted from payment of laboratory fees but are required to matriculate each year, paying the ordinary matriculation fee (£1 1*s.* for winter and summer; 10*s.* 6*d.* for summer). Forms of application for admission as research students may be had from the Secretary of the Senatus. The fees are £3 3*s.* for six hours per week in winter or nine hours per week in summer, 10*s.* 6*d.* and 7*s.* being charged for every extra hour per week in winter and summer respectively. The fee for the Public Health Laboratory for six months is £6 6*s.*, and for the Bacteriological Laboratory for three months is £4 4*s.*, £3 3*s.* and £1 11*s.* 6*d.* being respectively charged for a half course or any less time. At the Royal Lunatic Asylum, accommodating above 700 patients (fees, £2 2*s.* for three months), arrangements are made for extra teaching in the higher departments of medical psychology and cerebral pathology for graduates who desire it or wish to obtain the certificate of the Medico-Psychological Association of Great Britain and Ireland. Clinical work may be done at the following places:—(General Hospital): Aberdeen Royal Infirmary (accommodating 200 patients, perpetual ticket £6, or first year £3 10*s.* and second year £3, thereafter free); Sick Children's Hospital (75 patients; first year £2 2*s.*, then £1 1*s.*); City (Fever) Hospital (100 beds; £1 1*s.* for three months); General Dispensary and Lying-in and Vaccine Institution (10,000 out-patients per annum: perpetual fee, £3 3*s.*); and Ophthalmic Institution (16,000 patients per annum, fee £1 1*s.*). During the summer session (April to June) special classes, each costing £2 2*s.*, are held at the Royal Infirmary, the subjects being diseases of the skin, medical electricity, dental surgery, anæsthetics, ophthalmology, and gynæcology. Lectures on Diseases of the Ear and Throat are given at the dispensary.

Edinburgh.—For the past three years a post-graduate vacation course has been held in Edinburgh during the autumn. The arrangements in connexion with the course are intrusted to a committee, which consists of representatives appointed by the Faculty of Medicine of the University and by the Royal Colleges respectively. The arrangements of the course to be held this autumn are somewhat different from those of preceding years. The course will extend this year from August 31st to Sept. 26th, and will *comprise a Special* Surgical Course and a Course on General Medicine. The following classes are reserved for those attending the Surgical Course, the entries for which are limited to 25: (1) Operative Surgery on the cadaver (30 hours); (2) Surgical Anatomy, including five demonstrations on x rays applied to surgery (20 hours): and (3) Surgical Pathology, including five demonstrations upon microscopic methods of value in surgical diagnosis and upon the preparations of museum specimens (20 hours). In addition to the abovementioned classes, which are reserved for those who have entered for the Surgical Course from 11 to 1 o'clock each day, there will be surgical clinics in the wards, including eight clinics upon the commoner surgical affections of children; clinics in the out-patient department, and specially arranged ward visits, so that each day there will be from two to two and a half hours of special surgical instruction in the wards. The attendance upon these surgical clinics in the Royal *Infirmary* and Royal Hospital for Sick Children is open alike to those attending the surgical or the general course. The work undertaken in the various surgical classes has been so arranged that as far as possible the various regions of

Nov. 7th, 1900, he submitted an abstract of the vital statistics of the parish for the preceding 45 years and gave a brief account of the improvements in sanitary administration accomplished by the vestry since he entered its service in 1871. First among these came the question of notification and hospital treatment of infectious diseases. In 1871 and for some years afterwards a relieving officer's order was necessary for admission to the hospitals of the Asylums Board, so that (nominally at least) all the patients were paupers, and during the epidemics of small-pox in 1871 and afterwards some patients were deterred from entering the hospitals by the fear that the parish guardians would claim repayment of the hospital charges. At Dr. Dudfield's request the Kensington guardians refrained from making such claims, as well as from requiring a Poor-law medical officer to examine each patient before removal. In 1877 the question of the treatment of non-pauper patients in infectious hospitals arose. Dr. Dudfield's report on this subject deprecated the formation of local or district infectious hospitals, but recommended (1) a single hospital authority for London—the Asylums Board as a matter of convenience; (2) free admittance to the hospitals for all classes of the people; (3) depauperisation of medical relief in the hospitals; and (4) maintenance of the hospitals out of the Common Poor Fund created by the Metropolitan Poor Act, 1867. Writing in 1900, he reminded the vestry that "the views above set out, having received the approval of the vestry, were made the basis of efforts which never ceased until every principle contended for ...... had in successive Acts received the sanction of Parliament." Compulsory notification of infectious disease was recommended by him in his annual report for 1871 and efforts to procure voluntary notification were set on foot. During succeeding years he continued his representations on the subject until the vestry convened a conference which was held at the town-hall in March, 1881. In the following May a deputation waited on the President of the Local Government Board to submit the resolutions approved by the conference in favour of compulsory notification, and at this interview Dr. Dudfield recommended that small-pox patients should be removed from London to hospitals erected outside the metropolitan area. This suggestion was fully carried into effect by the Asylums Board in 1885, but compulsory notification was not introduced in London until 1889. Another of Dr. Dudfield's recommendations to the vestry had reference to the employment of female inspectors for visiting dressmakers' and milliners' establishments, laundries, and other places where the workpeople were mostly females. The idea was approved and in 1893 the vestry made a new departure in sanitary administrative work by appointing two female inspectors. The initiative of the Kensington vestry in this matter has been followed by numerous sanitary authorities in various parts of the country.

Dr. Dudfield was married in 1859; he has left a widow and family, his son, Dr. Reginald Dudfield, being medical officer of health of the borough of Paddington. The funeral service was held in the church of St. Mary Abbots, Kensington, on August 1st, and the interment took place in Brompton Cemetery.

THOMAS JONES EVANS, L.R.C.P. LOND., M.R.C.S. ENG.

THE death occurred on August 16th of Mr. Thomas Jones Evans at his residence Castle Green, Llansawel, Carmarthenshire, in his fiftieth year. Mr. Evans had practised for 28 years at Llansawel where he was very popular and highly esteemed. He held appointments under the Llandilofawr and the Llandovery boards of guardians. He had been in poor health for some time and had quite recently returned from a sea voyage, from which he had derived much benefit, and had resumed his professional work. He attended Llansawel Church on August 15th but on reaching home he had cerebral hæmorrhage and died on the following day. The funeral on August 21st was very largely attended; amongst those present were a considerable number of local medical men, Sir James Drummond, General Sir James Hills-Johnes, and many others.

DEATHS OF EMINENT FOREIGN MEDICAL MEN.—The deaths of the following eminent foreign medical men are announced:—Dr. Ignaz Hirsch, who has been bath physician at Teplitz for more than 40 years, aged 73.—Dr. George M. Edebohls, professor of gynæcology in the New York Post-Graduate Medical School and Hospital.—Dr. Loison, professor of military surgery in the Military Medical School, Paris.—Dr. B. Tomaszevski, *privat-docent* of psychiatry and neurology in the Military Medical Academy, St. Petersburg.—Dr. E. Menz, chief medical officer of the Assicurazioni Generali in Trieste.—Dr. J. Trapp, formerly professor of pharmacy in the St. Petersburg Military Medical Academy.—Dr. A. Ostrumoff, emeritus professor of medicine in the University of Moscow.

Medical News.

SOCIETY OF APOTHECARIES OF LONDON.—At examinations held in August the following candidates passed in the subjects indicated:—

Surgery.—R. B. Dawson (Sections I. and II.), Guy's Hospital; G. F. C. Harvey (Sections I. and II.), London Hospital; J. J. S. Rowe (Sections I. and II.), Charing Cross Hospital; and H. B. Waller (Section I.), London Hospital.

Medicine.—R. B. Dawson (Sections I. and II.), Guy's Hospital; and G. F. C. [illegible] H. R. Coombes,

Forensic [illegible] Cambridge and Guy's Hospital; G. F. C. Harvey, London Hospital; G. W. Hassall, Birmingham; and S. H. Watton, Manchester.

[illegible] College Hospital; H. R. Coombes. [illegible] A. H. C. Dawes, Westminster [illegible] A. C. Dickson, Guy's Hospital; H. A. Hancock, Cambridge and London Hospital; J. K. A. Helm; Guy's Hospital; and M. S. Jevons, Royal Free Hospital.

The Diploma of the Society was granted to the following candidate, entitling him to practise medicine, surgery, and midwifery:—J. K. A. Helm.

UNIVERSITY OF EDINBURGH.—The following is the official list of passes at the recent professional examinations for degrees in medicine and surgery:—

First Professional Examination.—John W. E. Adkins, William A. Alexander, James C. Anderson, Leslie L. Armstrong, Peter Baillie, Edwyn B. Barton, Francis J. H. Begg, Robert C. Begg, John H. Boag, Stuart Bolton, W. N. Gordon Boxer, James W. Bruce, Carl P. Carlsson, James F. Chalmers, Frederick C. Davidson, Alfred E. Delgado, Janet S. Doak, George A. C. Douglas, Richard Fawcitt, William R. Gardner, John J. Gilchrist, Robert Grant (M.A.), Arthur C. V. Green, Robert Hay, William J. G. Henderson, Thomas P. Herriot, Thomas H. Horrax, Thomas W. Jackson, David H. Jones (M.A.), Idwal W. Jones, Janet S. Laird, Christine Larsen, David P. Lindsay, Isabella M. Little, Frederick W. Mackenzie, James C. M'Kerrow (with distinction), Gertrude D. MacLaren, James S. M'Laren, Rosanna E. Macmillan, John Macqueen, Hamed Mahmud, Alexander W. Mather, James M. Matheson, Alexander Mearns, William Mitchell, Sarah O'Flynn, George F. B. Page (with distinction), Lennox J. D. Pawan, Wilfrid W. Phillips, Arthur C. Price, Edwin D. Pullon (with distinction), Aubrey Radford, [illegible] Renton, Andrew A. Rutherford [illegible] y M. Scott, Edward Sharpe, [illegible] (with distinction), Sydney [illegible] tewart, Fearnley Thompson, [illegible] ton, William G. Thwaytes, [illegible] Tisdall, George D. E. Tullis, [illegible] Clement S. Wills, Peter C. [illegible]

[illegible] ulations—Regulations Prior [illegible]

Second Professional Examination (Old Regulations—Anatomy, Physiology, and Materia Medica).—Edward Anderson, George J. Carr (B.A.), Frederick O. Clarke, Thomas F. Craig, Jemima B. Dickie, Wm. A. Dunn, John M. Elliot, Arthur C. England, Alastair G. Forbes, Matthew E. Goode, Annie C. Greenep, David S. Harvey, Samuel Hodkinson, Dirk van V. Hoffman, Nicholas J. Hofmeyer (B.A.), Gaspard de C. Hugo, Arthur J. G. Hunter, James S. P. Knight, Joseph J. Levin, Robert M'Adoo, Hugh J. M'Caw, John D. M'Ewen (M.A.), John T. Mackenzie, Elizabeth Macleod, George V. T. [illegible] Robertson, Henry C. Robbins, Lizzie Rose, [illegible] K. R. Shah, D. R. Bedell Sivright (B.A., [illegible] George H. Stevenson, and J. D. Grahame Stewart.

Se[illegible] (New Regulations—Anatomy and [illegible] lay, James C. Brash (M.A., B.Sc.) [illegible] Brown, Lawrence D. Callander, [illegible] Cochrane, Josias Daneel, Matthew [illegible] rew [illegible] Jo[illegible] D. L[illegible] Duncan J. M'Afee, George Macdonald, Keith B. MacGlashan, Marion [illegible] Mackinnon, William P. Murray, Leopold [illegible] Rao, Morton W. Ruthven, Thomas M'Call [illegible] Daisy L. Shawyer (B.A.), John C. Smith (M.A.), Dirk L. Theron, Roland Thorp, Harry C. Todd, James A. Tomb, Frederick L. Tulloch, Robert C. Wallace, Arthur M. Warwick, Frank H. C. Watson, and William L. Webster.

T[illegible]—James R. Adam, Thomas A. [illegible] ignold, Walter Bisset (M.A., [illegible] H. Carter, Peter Chalmers, L[illegible] Ralph B. Chamberlain, John P. Charnock, Bodh Raj Chopra, William F. Christie, Gladys H. Cook, Gerald M Coughtrey, Godfrey

investigation is also held. A course in clinical pathology or bacteriology is given to graduates, and members of this class have an opportunity of seeing the methods employed in the various investigations carried out in this department for the public health committee of the Belfast corporation in connexion with water-supply, sewage disposal, meat- and milk-supply, and the diagnosis of cases of infectious diseases. Subject to the number of students presenting themselves, arrangements are made for the necessary practical instruction (1) in the chemical laboratories; (2) in the pathological and bacteriological laboratories; and (3) for outdoor sanitary work under the medical officer of health of Belfast. These courses have been approved by the Privy Council in connexion with the degree of M.D. in State Medicine in the University of London. The certificates of these courses are also accepted for the diploma in public health granted by the Royal University of Ireland, the University of Cambridge, and the various licensing bodies.

Dublin.—The post-graduate courses arranged under the auspices of the President and Council of the Royal College of Surgeons in Ireland have hitherto proved a most gratifying success. The June course of the present year attracted a large and enthusiastic class. As our readers who are interested have, of course, learned from the advertisement columns, two annual courses of Post-graduate Study were arranged for—in June and September respectively. And, as the printed announcement states: "The object of these courses is to render available the whole of the clinical material in the city for the post-graduate student, so that he may see as much as possible during the brief time at his disposal." With this very comprehensive object in view the ten general hospitals of the city are included (Richmond, Jervis-street, Adelaide, St. Vincent's, Dr. Steevens', Mater Misericordiæ, Meath, Mercer's, Royal City of Dublin, and Sir Patrick Dun's), and also the various hospitals which are devoted to "specialties." The opportunities and wealth of material afforded by the latter are well shown by a momentary glance at the list of special subjects and the institutions where they are *respectively* cultivated: Skin, Adelaide Hospital; Eye and Ear, Royal Victoria Eye and Ear Hospital; Throat and Nose, Mater Misericordiæ Hospital, Adelaide Hospital, and Sir Patrick Dun's Hospital; Gynæcology, Rotunda Hospital, Coombe Hospital, and National Maternity Hospital; X Ray and Light Therapeutics, Meath Hospital and *Dr. Steevens'* Hospital; Pathology and Bacteriology, Richmond, Whitworth, and Hardwicke Hospitals, Mater Misericordiæ Hospital, Meath Hospital, and School of Surgery, Royal College of Surgeons; Diseases of Children, Orthopædic Hospital, St. Joseph's Hospital, and Harcourt-street Hospital; Lunacy, Richmond District Lunatic *Asylum*; *Anæsthetics*, Dental Hospital; Cadaver Operations, *Professors* at School of Surgery, R.C.S.I.; Anatomy, Professor of Anatomy, R.C.S.I.; Sanitary Science, Professor of Hygiene, R.C.S.I. The second course will begin *on Monday*, Sept. 21st, 1908, and will terminate on Oct. 13th following. Fee for each course, inclusive of all, £5 5*s*.

VITAL STATISTICS.

HEALTH OF ENGLISH TOWNS.

IN 76 of the largest English towns 8458 births and 4905 deaths were registered during the week ending August 22nd. The annual rate of mortality in these towns, which had steadily increased in the five preceding weeks *from* 11·1 to 15·0 per 1000, further rose to 15·8 in the week under notice. During the first eight weeks of the current quarter the death-rate in these towns, notwithstanding this increase, averaged only 12·8 per 1000, and the mean rate in London did not exceed 11·8. The lowest annual death-rates in these 76 towns during the week under notice were 5·4 in West Hartlepool, 6·7 in Hornsey, 7·3 in Willesden, and 7·9 in Leyton and in Walthamstow; the rates in the other towns ranged upwards, however, to 23·8 in Oldham, 24·1 in Rochdale, 26·8 in Wigan, and 28·2 in Rhondda. In London the death-rate during the week did *not* exceed 14·2. The 4905 deaths from all causes in the 76 towns showed a *further* increase of 222 upon the increasing numbers in recent weeks, and included 1340 which were referred to the *principal* epidemic diseases, against numbers increasing steadily from 299 to 1132 in the seven preceding weeks; of these 1340 deaths from these diseases, 1133 resulted from diarrhœa, 70 from measles, 49 from whooping-cough, 46 *from* diphtheria, 24 *from* scarlet fever, and 18 from "fever" (principally enteric), but not one from small-pox. The deaths from these epidemic diseases during the week under notice were equal to an annual rate of 4·3 per 1000, against rates increasing from 1·1 to 3·6 in the five preceding weeks; in London the death-rate from these epidemic diseases did not exceed 3·3 per 1000. No death from any of these epidemic diseases was registered last week in Hornsey, Hastings, Ipswich, or Great Yarmouth, whereas the annual death-rates from these diseases ranged upwards in the other large towns to 9·9 in Wigan and in Burnley, 10·2 in Hull, 10·6 in Middlesbrough, and 17·6 in Rhondda. The deaths attributed to diarrhœa in the 76 towns, which had steadily increased in the ten preceding weeks from 63 to 927, further rose to 1133 in the week under notice, and caused annual death-rates in these towns ranging upwards to 8·7 in Wigan 9·4 in Burnley, 9·6 in Middlesbrough, 10·2 in Hull, and 16·4 in Rhondda. The marked increase in the death-rate recorded in recent weeks has been almost entirely due to diarrhœa, mainly infantile. The 70 fatal *cases of measles in these* towns last week showed a slight increase, while the 49 of whooping-cough were fewer than in any recent week; measles was proportionally most fatal in Rochdale, Warrington, and Huddersfield, and whooping-cough in Coventry, Burton-on-Trent, and Stockton-on-Tees. The 46 deaths resulting from diphtheria showed a further increase upon recent weekly numbers, and included 25 in London and its suburban districts, five in Manchester and Salford, and two in Liverpool and in Brighton. The fatal cases of scarlet fever were, however, fewer than in recent weeks, but included six in Liverpool and four in Manchester and Salford. The 18 deaths referred to "fever" included two in Liverpool and two in Norwich. The number of scarlet fever patients under treatment in the Metropolitan Asylums and the London Fever Hospitals, which had increased in the five preceding weeks from 2573 to 2808, had further risen to 2844 on August 22nd; the number of new cases of this disease admitted to these hospitals during the week under notice were 392, against 363, 358, and 343 in the three preceding weeks. The deaths in London referred to pneumonia and other diseases of the respiratory organs, which had been 132 and 128 in the two preceding weeks, further declined to 106 in the week under notice, and were three below the average number in the corresponding week of the five years 1903-07. The causes of 34, or 0·7 per cent., of the deaths registered in the 76 towns during the week were not certified either by a registered medical practitioner or by a coroner. All the causes of death were again duly certified in Bristol, West Ham, Bradford, Newcastle-on-Tyne, Hull, Nottingham, Leicester, and in 49 other smaller towns in the week under notice, and all but one of the 1306 causes of death in London were certified; five uncertified causes of death were, however, registered in Liverpool and in Sheffield, and four in Birmingham.

In 76 of the largest English towns 8303 births and 4856 deaths were registered during the week ending August 29th. The annual rate of mortality in these towns, which had steadily increased in the six preceding weeks from 11·1 to 15·8 per 1000, showed a slight decline to 15·6 in the week under notice, influenced by the lower temperature and increased rainfall. During the first nine weeks of the current quarter the annual death-rate in these towns averaged only 13·1 per 1000, and the mean rate in London did not exceed 12·1. The lowest annual death-rates in these 76 towns during the week under notice were 4·5 in Reading, 6·0 in Willesden, 6·1 in Wallasey, and 6·7 in Hornsey; the rates in the other towns ranged upwards, however, to 25·7 in Merthyr Tydfil, 26·7 in Middlesbrough, 26·8 in Hanley, 31·1 in Stockport, and 31·3 in Rhondda. In London the death-rate during the week did not exceed 14·4. The 4856 deaths from all causes in the 76 towns showed a decline of 49 from the increasing numbers in recent weeks, and included 1344 which were *referred* to the principal epidemic diseases, against numbers increasing steadily from 299 to 1340 in the eight preceding weeks; of these 1344 deaths, 1124 resulted from diarrhœa, 64 from whooping-cough, 56

Nov. 7th, 1900, he submitted an abstract of the vital statistics of the parish for the preceding 45 years and gave a brief account of the improvements in sanitary administration accomplished by the vestry since he entered its service in 1871. First among these came the question of notification and hospital treatment of infectious diseases. In 1871 and for some years afterwards a relieving officer's order was necessary for admission to the hospitals of the Asylums Board, so that (nominally at least) all the patients were paupers, and during the epidemics of small-pox in 1871 and afterwards some patients were deterred from entering the hospitals by the fear that the parish guardians would claim repayment of the hospital charges. At Dr. Dudfield's request the Kensington guardians refrained from making such claims, as well as from requiring a Poor-law medical officer to examine each patient before removal. In 1877 the question of the treatment of non-pauper patients in infectious hospitals arose. Dr. Dudfield's report on this subject deprecated the formation of local or district infectious hospitals, but recommended (1) a single hospital authority for London—the Asylums Board as a matter of convenience; (2) free admittance to the hospitals for all classes of the people; (3) depauperisation of medical relief in the hospitals; and (4) maintenance of the hospitals out of the Common Poor Fund created by the Metropolitan Poor Act, 1867. Writing in 1900, he reminded the vestry that "the views above set out, having received the approval of the vestry, were made the basis of efforts which never ceased until every principle contended for ...... had in successive Acts received the sanction of Parliament." Compulsory notification of infectious disease was recommended by him in his annual report for 1871 and efforts to procure voluntary notification were set on foot. During succeeding years he continued his representations on the subject until the vestry convened a conference which was held at the town-hall in March, 1881. In the following May a deputation waited on the President of the Local Government Board to submit the resolutions approved by the conference in favour of compulsory notification, and at this interview Dr. Dudfield recommended that small-pox patients should be removed from London to hospitals erected outside the metropolitan area. This suggestion was fully carried into effect by the Asylums Board in 1885, but compulsory notification was not introduced in London until 1889. Another of Dr. Dudfield's recommendations to the vestry had reference to the employment of female inspectors for visiting dressmakers' and milliners' establishments, laundries, and other places where the workpeople were mostly females. The idea was approved and in 1893 the vestry made a new departure in sanitary administrative work by appointing two female inspectors. The initiative of the Kensington vestry in this matter has been followed by numerous sanitary authorities in various parts of the country.

Dr. Dudfield was married in 1859; he has left a widow and family, his son, Dr. Reginald Dudfield, being medical officer of health of the borough of Paddington. The funeral service was held in the church of St. Mary Abbots, Kensington, on August 1st, and the interment took place in Brompton Cemetery.

THOMAS JONES EVANS, L.R.C.P. LOND., M.R.C.S. ENG.

THE death occurred on August 16th of Mr. Thomas Jones Evans at his residence Castle Green, Llansawel, Carmarthenshire, in his fiftieth year. Mr. Evans had practised for 28 years at Llansawel where he was very popular and highly esteemed. He held appointments under the Llandilofawr and the Llandovery boards of guardians. He had been in poor health for some time and had quite recently returned from a sea voyage, from which he had derived much benefit, and had resumed his professional work. He attended Llansawel Church on August 15th but on reaching home he had cerebral hæmorrhage and died on the following day. The funeral on August 21st was very largely attended; amongst those present were a considerable number of local medical men, Sir James Drummond, General Sir James Hills-Johnes, and many others.

DEATHS OF EMINENT FOREIGN MEDICAL MEN.—The deaths of the following eminent foreign medical men are announced:—Dr. Ignaz Hirsch, who has been bath physician at Teplitz for more than 40 years, aged 73.—Dr. George M. Edebohls, professor of gynæcology in the New York Post-Graduate Medical School and Hospital.—Dr. Loison, professor of military surgery in the Military Medical School, Paris.—Dr. B. Tomaszevski, *privat-docent* of psychiatry and neurology in the Military Medical Academy, St. Petersburg.—Dr. E. Menz, chief medical officer of the *Assicurazioni Generali* in Trieste.—Dr. J. Trapp, formerly professor of pharmacy in the St. Petersburg Military Medical Academy.—Dr. A. Ostrumoff, emeritus professor of medicine in the University of Moscow.

William F. Christie, Gladys H. Cook,

against numbers increasing steadily from 11 to 43 in the seven preceding weeks. These 44 deaths were equal to an annual rate of 5·8 per 1000; the rate during the week from the same diseases did not exceed 3·3 in London and 1·3 in Edinburgh. Of the 44 deaths from these epidemic diseases in Dublin during the week under notice, 39 resulted from diarrhœa, two from measles, two from diphtheria, and one from "fever," but not one from scarlet fever, whooping-cough, or small-pox. The deaths attributed to diarrhœa, which had steadily increased from three to 37 in the six preceding weeks, further rose to 39 in the week under notice. The 182 deaths from all causes during the week included 55 of infants under one year of age, and 27 of persons aged upwards of 60 years; both these numbers showed a slight decline from those in the previous week. Six inquest cases and five deaths from violence were registered, and 60, or 32·9 per cent., of the deaths registered during the week occurred in public institutions. The causes of three, or 1·6 per cent., of the registered deaths were not certified; in London the causes of all but one of the 1306 deaths were duly certified, as were the causes of all the 85 deaths in Edinburgh.

The annual rate of mortality in Dublin, which had increased in the four preceding weeks from 16·8 to 24·1 per 1000, declined again to 22·5 in the week ending August 29th. During the first nine weeks of the current quarter the death-rate in Dublin averaged 19·6 per 1000; the mean rate during the same period did not exceed 12·1 in London and 12·7 in Edinburgh. The 170 deaths of Dublin residents during the week under notice showed a decline of 12 from the increasing numbers in recent weeks, and included 35 which were referred to the principal epidemic diseases, against numbers increasing steadily from 11 to 44 in the eight preceding weeks. These 35 deaths were equal to an annual rate of 4·6 per 1000; the rate during the week from the same diseases did not exceed 3·5 in London and 2·4 in Edinburgh. Of the 35 deaths from these epidemic diseases in Dublin during the week under notice, 26 resulted from diarrhœa, eight from measles, and one from "fever," but not one from scarlet fever, diphtheria, whooping-cough, or small-pox. The deaths attributed to diarrhœa, which had steadily increased in the seven preceding weeks from three to 39, declined to 26 in the week under notice; the eight fatal cases of measles showed a marked increase upon the numbers returned in recent weeks. The 170 deaths from all causes during the week included 52 of infants under one year of age and 34 of persons aged upwards of 60 years; those of infants were fewer, and of elderly persons more numerous than in the previous week. Four inquest cases and four deaths from violence were registered; and 76, or 44·7 per cent., of the deaths occurred in public institutions. The causes of five, or 2·9 per cent., of the registered deaths were not certified; in London the causes of all but two of the 1327 deaths were duly certified, and in Edinburgh 1·9 per cent. of the causes of death were not certified.

VITAL STATISTICS OF LONDON DURING JULY, 1908.

IN the accompanying table will be found summarised complete statistics relating to sickness and mortality in the City of London and in each of the metropolitan boroughs. With regard to the notified cases of infectious disease, it appears that the number of persons reported to be suffering from one or other of the nine diseases specified in the table was equal to an annual rate of 6·5 per 1000 of the population, estimated at 4,795,757 persons in the middle of the year; in the three preceding months the rates were 6·1, 6·2, and 5·6 per 1000 respectively. The lowest rates last month were recorded in the Cities of London and Westminster and the boroughs of Kensington, Hampstead, Holborn, and Greenwich; and the highest rates in Shoreditch, Bethnal Green, Stepney, Bermondsey, and Battersea. Scarlet fever was more prevalent in July than in any of the four preceding months; among the various metropolitan boroughs this disease was proportionally most prevalent in Shoreditch, Bethnal Green, Stepney, Bermondsey, and Battersea. The Metropolitan Asylums Hospitals contained 2693 scarlet fever patients at the end of last month, against 2868, 2707, and 2514 at the end of the three preceding months; the weekly admissions averaged 372, against 319, 342, and 307 in the three preceding months. The prevalence of diphtheria showed a slight increase over that recorded in June; this disease was proportionally most prevalent in Hammersmith, Fulham, Chelsea, Finsbury, Bermondsey, Lewisham, and Woolwich. The number of diphtheria patients under treatment in the Metropolitan Asylums Hospitals, which had been 872, 804, and 768 at the end of the three preceding months, had further declined to 738 at the end of July; the weekly admissions averaged 100, against 107, 105, and 95 in the three preceding months. Enteric fever also showed a slightly increased prevalence last month; among the several metropolitan boroughs this disease was proportionally most prevalent in the City of Westminster, St. Marylebone, Hampstead, Islington, Finsbury, Shoreditch, and Bethnal Green. The Metropolitan Asylums Hospitals contained 54 enteric fever patients at the end of last month, against 45 and 48 at the end of the two preceding months; the weekly admissions averaged nine in July, against seven and eight in the two preceding months. Erysipelas was proportionally most prevalent in St. Pancras, Holborn, Bethnal Green, Stepney, Southwark, Bermondsey, and Deptford. The 27 cases of puerperal fever notified during the month included four in Fulham, three each in Islington, Hackney, and Wandsworth, and two each in Kensington, Lambeth, and Woolwich. Of the ten cases notified as cerebro-spinal meningitis, three belonged to Lambeth, two to Hackney, and one each to Paddington, Kensington, Stoke Newington, Shoreditch, and Poplar.

The mortality statistics in the table relate to the deaths of persons actually belonging to the various boroughs, the deaths occurring in institutions having been distributed among the boroughs in which the deceased persons had previously resided. During the five weeks ending August 1st the deaths of 4757 persons belonging to London were registered, equal to an annual rate of 10·3 per 1000; in the three preceding months the death-rates were 14·9, 12·2, and 10·4 per 1000 respectively. The rates of mortality in the several boroughs ranged last month from 5·9 in Hampstead, 7·5 in Lewisham, 8·1 in Battersea, 8·2 in Kensington, 8·3 in Woolwich, and 8·4 in Hammersmith and in Greenwich, to 13·0 in the City of London, in Southwark, and in Bermondsey, 13·1 in Stepney, 13·3 in Shoreditch, 13·4 in Bethnal Green, 14·9 in Holborn, and 16·2 in Finsbury. The 4757 deaths from all causes included 443 which were referred to the principal infectious diseases; of these, 114 resulted from measles, 39 from scarlet fever, 42 from diphtheria, 66 from whooping-cough, 11 from enteric fever, and 171 from diarrhœa, but not any from small-pox, from typhus fever, or from ill-defined pyrexia. The lowest death-rates last month from these diseases in the aggregate were recorded in St. Marylebone, Hampstead, Stoke Newington, City of London, Wandsworth, Lewisham, and Woolwich; and the highest rates in Fulham, Finsbury, Shoreditch, Bethnal Green, Stepney, Poplar, and Bermondsey. The 114 deaths from measles were 50 below the corrected average number for the corresponding period of the five preceding years; this disease showed the greatest proportional fatality last month in Bethnal Green, Stepney, Poplar, Southwark, Bermondsey, and Lambeth. The 39 fatal cases of scarlet fever were slightly fewer than the corrected average number; this disease was proportionally most fatal in Paddington, Hampstead, Islington, Shoreditch, Bethnal Green, Stepney, Poplar, and Lambeth. The 42 deaths from diphtheria also showed a slight decline from the average; among the various metropolitan boroughs the highest death-rates from this disease last month were recorded in Fulham, Chelsea, St. Marylebone, Islington, Stepney, Bermondsey, Wandsworth, and Camberwell. The 66 fatal cases of whooping-cough were 54 below the corrected average number; the greatest proportional mortality from this disease occurred in St. Pancras, Islington, Finsbury, Bethnal Green, Poplar, and Southwark. The 11 deaths referred to "fever" were less than one-half of the corrected average number in the corresponding period of the five preceding years; of these 11 deaths, two belonged to the City of Westminster and one each to Paddington, Chelsea, Islington, Finsbury, Shoreditch, Lambeth, Battersea, Wandsworth, and Deptford. The 171 fatal cases of diarrhœa were equal to only one-third of the corrected average number; among the various metropolitan boroughs this disease was proportionally most fatal in Kensington, Fulham, Finsbury, Shoreditch, Bethnal Green, and Poplar. In conclusion, it any way attributable to the operation but to a cause entirely unconnected with it.

A Shropshire Centenarian.—Mrs. S. Hughes, of Oswestry (Salop), has recently completed her 102nd year.

It is suggested by the Weymouth board of guardians that the coastguard stations on the Dorset coast which have recently been closed should be used as sanatoriums for consumptive patients.

Mr. Roderick Simms, who had a practice in the south of France but who was acting as locum-tenent for Mr. H. J. Holman at Eastbourne, died suddenly while attempting to enter a motor-car at Eastbourne railway station on August 11th. At the inquest on the following day it was stated that the deceased had been in extremely delicate health and was unable to winter in England. Death was attributed to heart failure, and a verdict of "Death from natural causes" was returned. The deceased was 41 years of age.

At the meeting of the West Sussex education committee on August 12th, Mr. Stanley Child, M.B., B.C. Cantab., M.R.C.S. Eng., L.R.C.P. Lond., was elected medical officer at the salary of £350 per annum and out-of-pocket expenses. There were 78 applicants for the post, of whom no fewer than 12 were ladies. To one of the lady applicants the staff subcommittee wrote stating that it had come to the conclusion that the work would be too arduous for her, for which reason she had not been selected for an interview.

Appointments.

Successful applicants for V … of Public Institutions, and others possessing … mn, are invited to forward tc … the Sub-Editor, not later than … of each week, such information for gratuitous publication.

Buist, James Joseph, M.B. Lond., L.S.A., has been appointed *Public Vaccinator for Cardiff.*

Coutts, Francis James Henderson, M.D., B.Sc., D.P.H. Manch., has been appointed an *Inspector of Foods* on the Medical Staff of the Local Government Board.

Dunlop, J. B., M.A., M.B., B.C. Cantab., M.R.C.S., L.R.C.P. Lond., has been appointed Medical Officer to the Bradford Post Office.

Green, Thomas Arthur, M.D., C.M. Edin., F.R.C.S. Edin., has been appointed Medical Inspector by the Bristol Education Committee.

Grey, H. Martin, M.R.C.S., L.R.C.P., has been appointed Assistant Resident Medical Officer to the Royal Albert Hospital, Devonport.

Griffin, W., M.D., has been appointed District Medical Officer by the Tavistock (Devon) Board of Guardians.

Gunn, A. R., M.B., B.S. Edin., has been appointed Certifying Surgeon under the Factory and Workshop Act for the Ullapool District of the county of Ross and Cromarty.

may be stated that the aggregate mortality in London last month from these principal infectious diseases was more than 52 per cent. below the average.

Infant mortality, measured by the proportion of deaths among children under one year of age to registered births, was equal to 82 per 1000. The lowest rates of infant mortality were recorded in St. Marylebone, Hampstead, Holborn, Battersea, Greenwich, and Lewisham; and the highest rates in Kensington, Stoke Newington, Finsbury, Shoreditch, Stepney, Southwark, and Deptford.

THE SERVICES.

ROYAL NAVY MEDICAL SERVICE.

THE following appointment is notified:—Staff Surgeon: J. H. Lightfoot, to the *Leda*, on recommissioning.

ROYAL ARMY MEDICAL CORPS.

Major H. C. Thurston, C.M.G., vacates the appointment of Deputy Assistant Director-General, A.M.S., at army headquarters, on the completion of his four years' tenure. Major Edwin T. F. Birrell to be a Deputy Assistant Director-General at headquarters, vice Major H. C. Thurston, C.M.G. (dated August 18th, 1908).

The undermentioned to be Lieutenants on probation (dated August 1st, 1908): David Stirling Buist, Charlie Ryles, Stuart McKenzie Saunders, William Edward Marshall, Gilbert Golding Collet, Edmund Vaine Vaughan, Alexander Morton Pollard, Herbert Gall, Thomas Burton-shaw Nicholls, Julian Babington Jones, William Gordon Wright, James Aitken Clark, Albert Thomas James McCreery, Charles Gregg Sherlock, John Startin, Colin Clarke, Arthur Norman Roy McNeill, Harold Bevis, Andrew Rae Wright, Austin William Byrne, Charles Hyacinth O'Rorke, George Singleton Parkinson, Thomas John Mitchell, Frank Hey Somers-Gardner, Harold Howard Leeson, Samuel Wasson Kyle, Denis Eldred Curwen Pottinger, John William Lane, George Hall Stack, and Donald Hector Colin MacArthur.

The undermentioned lieutenants are seconded, under the provisions of Article 300, Royal Warrant for Pay and Promotion, 1907 (dated August 1st, 1908): Gilbert G. Collet, James A. Clark, and Harold H. Leeson.

Lieutenant Alan C. Vidal, from temporary half-pay, to be Lieutenant (dated August 10th, 1908). Captain J. H. Robinson, from the Royal Army Medical College, has been selected for service at Fermoy. Captain W. Byam has been selected for employment with the Egyptian army.

INDIAN MEDICAL SERVICE.

Lieutenant-Colonel C. F. Willis has been appointed to officiate as principal medical officer, Jubbulpore and Jhansi Brigades, vice Colonel D. O'Sullivan, R.A.M.C., appointed to act as principal medical officer, 5th (Mhow) Division.

An Army Department Note has been issued from Army headquarters, Simla, on the subject of specialist pay to military medical officers. It states that specialist pay is an allowance to officers below the rank of lieutenant-colonel for special sanitary, surgical, or medical work done for the State, which it is *not* in the power of ordinary medical officers to perform with the same efficiency as a specialist. It is not a personal allowance, but is granted only to incumbents of certain specified appointments when actually in a position to perform duties connected therewith. Officers of the Indian Medical Service in civil employment are not eligible for employment as specialists, but officers of the Royal Army Medical Corps in India are eligible for appointment as specialists under qualifications laid down by the Army Council. The eligibility of an officer of the Indian Medical Service for appointment as a specialist is decided by the Director-General of that service, whose conclusion is based either on certificates of a recognised institution or by examination of the candidate.

VOLUNTEER CORPS.

Royal Garrison Artillery (*Volunteers*): 1st Shropshire and Staffordshire: Surgeon-Captain Wheelton Hind resigns his commission (dated March 31st, 1908). Surgeon-Lieutenant Colonel and Honorary Surgeon-Colonel John P. Massingham resigns his commission, with permission to retain his rank and to wear the prescribed uniform (dated March 27th, 1908).

Rifle.—6th Volunteer Battalion, The Royal Scots (Lothian Regiment): Surgeon-Captain Clement B. Gunn and Surgeon-Lieutenant James H. Horsburgh resign their commissions (dated March 31st, 1908). 3rd Volunteer Battalion, The Queen's (Royal West Surrey Regiment): Surgeon-Lieutenant Edmund F. Rose resigns his commission (dated March 31st, 1908). 2nd Volunteer Battalion, The Royal Scots Fusiliers: Surgeon-Lieutenant Robert Nelson resigns his commission (dated March 31st, 1908). 1st Volunteer *Battalion*, The Duke of Cornwall's Light Infantry: Surgeon-Captain Francis Chown resigns his commission (dated March 31st, 1908). 1st Volunteer Battalion, The Northamptonshire Regiment: Surgeon-Captain Herbert S. Baker resigns his commission (dated March 31st, 1908). 2nd Volunteer Battalion, The Highland Light Infantry: Surgeon-Major Walter Sandeman resigns his commission, with permission to retain his rank, and to wear the prescribed uniform (dated March 31st, 1908). Surgeon-Lieutenant William S. Paterson resigns his commission (dated March 31st, 1908). 2nd Volunteer Battalion, The Royal Fusiliers (City of London Regiment): Surgeon-Captain Michael G. Foster resigns his commission (dated March 31st, 1908). 4th Volunteer Battalion, The Queen's Own (Royal West Kent Regiment): Surgeon-Captain Arthur T. F. Brown resigns his commision (dated March 31st, 1908).

The following headquarters have been established for the London Territorial medical units: 1st London General Hospital at 9, Tufton-street, Westminster; 2nd London General Hospital at 71, New-street, Kennington Park; and 2nd London Sanitary Company at 51, Calthorpe-street, Gray's-inn-road.

THE ARMY AND NAVY MALE NURSES' COÖPERATION.

The first annual report of the executive committee of the Army and Navy Male Nurses' Coöperation points out that the existence of the coöperation has entirely depended on donations and subscriptions, and the small commission of 10 per cent. deducted from the nurses' fees. The expenses of the offices and advertising cannot be met at present out of the commission of 10 per cent. on the earnings of the 30 nurses now enrolled on the register, though they have been kept constantly in work and the applications for nurses are daily increasing. The committee therefore trust that the generosity of the public will enable them to build up a society which, in time, will be free from all claims on charity. It will be necessary to have at least 150 nurses in constant employment before the office expenses can be met by the percentage taken from their earnings. Advertising is also essential for the success of the scheme. Funds are also required for a residential home, and a small flat has been taken to lodge nurses who are next on the list for attendance on patients. Sir Frederick Treves was elected president of the coöperation and Sir Edward Ward and Inspector-General Maclean, R.N., were elected members of the executive committee. The income of the coöperation from incorporation to June 30th last was £1287 and the expenditure £961.

On August 21st Admiral Berryer of the French Navy visited the Naval Hospital, Gibraltar, and on behalf of his Government presented medals and other tokens of gratitude to the nursing sisters and members of the sick berth staff who attended the French seamen injured in the explosion on board the French cruiser *Jeanne d'Arc* last February. The Governor of Gibraltar and many naval officers were present at the ceremony. Admiral Berryer made a short speech, in reply to which Deputy-Inspector-General Charles James thanked the Admiral for the honour conferred upon the officers and staff of the hospital, and stated that the thanks of His Majesty's service would be conveyed to the French Government through the proper channels.

His Highness the Khedive of Egypt has awarded to Lieutenant-Colonel (local Colonel) George Douglas Hunter, D.S.O., R.A.M.C., attached to the Egyptian army, the Insignia of the Second Class of the Imperial Ottoman Order of the Medjidieh, and to Major George Dansey-Browning, R.A.M.C., the Insignia of the Fourth Class of the Order of the Osmanieh.

Notes, Short Comments, and Answers to Correspondents.

PRAYERS FOR THE SICK.

UNDER this title a correspondent of the *Halifax Courier*, writing above the initials "J. W. S.," has suggested that when prayers are asked in a place of worship for sick persons there should be rendered to those sick persons or their friends the aid of a medical consultation as well as the spiritual assistance which is sought. His suggestion is that the minister should "have the privilege, as an act of grace, to ask or to offer to send any physician or doctor in his congregation to go and see the sick person and consult with the medical attendant to find out if some other means of remedy cannot be tried to restore health." He also adds the suggestion that "there should be a town's physician of advice for the medical officers of health in towns to apply for advice in dangerous cases amongst the poor, and for such visit or advice to be free or the fee quite optional." We fear that his first proposal is not exactly practical and the intervention of the minister, however well meant, can only lead to confusion. The patient, the friends of the patient, and the medical man in attendance upon the patient might all have reasons for desiring a particular consultant and they could obtain his services directly. On the other hand, there might be no reason whatever for inviting the opinion of any one of the medical men forming a regular part of the minister's congregation. We do not quite understand what "J. W. S." means by his second proposal; it is very obscurely worded, and we think that he is not quite clear in his mind as to what a medical officer of health may be. A community could not support and pay a consulting physician for reasons that will be apparent to anyone who knows anything of the proper relations between medical men and the public.

THE FIRST MEDICAL BOOK PUBLISHED.

To the Editor of THE LANCET.

SIR,—In THE LANCET of August 22nd, p. 596, in "Notes, Short Comments, and Answers to Correspondents," referring to "An Adaptable Remedy and a Famous Quack," Mr. R. S. Wilkinson believes the "Compleat Practise of Physick," 1655, to be the first medical book published in English. I have in my possession, and in English, a well-preserved edition of—

> "The Breuvary of Health, named the Extravagantes followeth compyled by Andrewe Boorde of Physicke doctor.
>
> Examined in Oxford in June the yere of our Lord MCCCCCXLVI. and in the reigne of our souerayne Lorde Kynge Henry the viij., King of Englande, Fraunce, and Irelande, the xxxviij. yere. And newly Imprinted & Corrected the yere of our Lorde God MCCCCCLII.
>
> Imprinted at London in Flete Strete at the signe of the George next to Saynt Dunstone's Church by Willyam Powell. In the yere of our Lord God MDLII."

I have a rather dim recollection of an Andrewe Boorde, M.D., as mentioned by one of the commentators on Shakespeare. I have a further idea of having once read that an itinerant quack of the name of Andrewe Boorde was the original merry Andrew. It would be interesting if any of your readers could throw light on curious old matters of this kind. I am, Sir, yours faithfully,

Worthing, August 24th, 1908. WILLIAM KELLY, M.R.C.S. Eng.

PS.—It would be interesting to know if there is in existence an earlier medical book published in English than this one of Andrewe Boorde printed in 1552.

PUBLIC HEALTH AND SANITATION IN WEI-HAI-WEI.

MR. J. H. Stewart Lockhart, C.M.G., in his annual report on this territory—which, it will be remembered, was leased to Great Britain by China by a convention made in July, 1898—mentions that there has been remarkable freedom from disease during the past year. No cases of small-pox were reported. The Chinese inhabitants are fully alive to the advantages of vaccination, which has been systematically carried out. The number of vaccinations performed were 3737 on the mainland and 128 on the island, as compared with 3064 on the mainland and 223 on the island in 1906. There was little dysentery at any time during the year. Although no enteric fever could be traced locally there were two cases among the summer visitors. One of these was certainly imported from Shanghai; the origin of the other was more obscure but it seems probable that in this case also infection was introduced from outside the territory. Three cases of beri-beri occurred among the Japanese in connexion with a single building; the house and soil have been thoroughly disinfected and it is hoped that there will be no recurrence of the disease. The sanitary condition of Port Edward and the island is good. A new dairy erected on the mainland has been well kept and has supplied milk of a good quality. In the civil hospitals the in-patients treated during the year on the island numbered 35 and at Port Edward 120. There were on the island 2520 out-patients and at Port Edward 2306; these figures show a very satisfactory increase, the number of admissions at Port Edward being nearly three times as many as in the previous year. The behaviour and health of prisoners in the gaol were excellent. It has been found that the cure during imprisonment of any but the most confirmed opium smokers has been effected by depriving the smoker entirely of the drug at the cost to him of not more than a week or ten days of diarrhœa and malaise. Cases of suicide in Wei-hai-wei have been comparatively numerous. By far the greater number occur among women, the motive in many cases being trivial in the extreme. The frequency of suicide appears to be due partly to the fact that the idea of death in itself does not seem to act as a deterrent, and partly to the fact that the taking one's own life is apparently not regarded as disgraceful or as implying any moral obliquity. The district officer reports that so far as his experience goes the only occasions on which an act of suicide is condemned by the general voice of the community are when a young married woman destroys herself before she has presented her husband with a son or while she is still nursing an infant. The meteorological return for 1907 shows that the highest monthly barometrical average was for December, 30·209 inches, and the lowest for August, 29·624 inches, the average monthly range being 0·546 inch. The highest temperature was 92° F., recorded in June and August, and the lowest 7° F., in January and February. Rain or snow fell on 90 days, the annual fall being 37·85 inches, an amount higher than the average and exceeded only once in the last seven years. July was the wettest month with a rainfall of 12·29 inches.

AN ANCIENT PICTURE.

A CORRESPONDENT asks us for information concerning an old picture, presumably an engraving, which has recently come into his possession. The subject is stated to be Harvey describing the circulation of the blood to Charles I., and it is signed in the left-hand corner "*Robert Hannah*" and in the right "*Henry Lemon.*" It represents Harvey with a heart in his hand addressing Charles I., the viscus probably being that of a deer, as a deer's head is on the table. The Prince of Wales is leaning over the table with a Virgil in his hand and four other figures are grouped round, two of whom are presumably physicians as they are pressing their traditional round-knobbed walking-sticks against their nether lips. Our correspondent would like suggestions for the names of these physicians and any information that may be forthcoming about the picture.

WE have received from Messrs. Heynes, Mathew, and Co., of Cape Town a catalogue of scientific apparatus which they are prepared to supply to medical men, public health authorities, departments of agriculture, practical mineralogists, and so on in South Africa. The catalogue contains all the usual urinometers and saccharometers and the prices quoted for more expensive articles such as bacteriological microscopes, prospectors' outfits, incubators, and microtomes are distinctly reasonable.

◆

Dr. John M. Thompson (Chicago).—Our correspondent's address is undecipherable. The powder was analysed in our Laboratory and said to contain the very ordinary ingredients which occur in well-known formulæ of a similar sort. We added that we had received a list of testimonials containing "arrant nonsense." It is our experience that the American quack habitually and wrongfully makes use of our name in the way now brought to our knowledge. Letters pointing out the fact to the editors of American newspapers have no effect, so that we can occupy our time in more useful ways than writing them. Our note upon the powder was published in THE LANCET of April 26th, 1902, p. 1192. Perhaps our correspondent could assure the editor of the paper publishing the advertisement that the advertiser is an inaccurate person. We are sure that we should be unable to persuade him to have no more dealings of the sort.

COMMUNICATIONS not noticed in our present issue will receive attention in our next.

During the week marked copies of the following newspapers have been received:—*Times, Daily News, Star, Yorkshire Post, Glasgow Herald, Pall Mall Gazette, Science Siftings, Daily Chronicle, Liverpool Mercury, Sheffield Weekly Telegraph, Daily Telegraph, Newcastle Daily Birmingham Post, Irish Independent, Scotsman, Thames Valley Times, Hull Chronicle, Army and Navy Gazette, Eastern Morning News, &c.*

A CONTROVERSY ABOUT TEA.

To the Editor of THE LANCET.

SIR,—Your editorial note in THE LANCET of August 8th, p. 421, stating that the adulteration of China tea referred to by your correspondent is now quite remote history owing to the effect of the Sale of Food and Drugs Act of 1875 *providing for examination of tea by the* Custom House authorities, has incited me to inquire into your original account of the controversy about tea and exposure of the methods of its adulteration adopted by the manufacturers of tea in China prior to that date. I have referred to your articles on Tea and its Adulteration, published in the year 1851. In THE LANCET, 1851, Vol. II., p. 90, an editorial article mentions that considerable skill and ingenuity are displayed in the adulteration of tea as well as in the manufacture of spurious articles in its imitation. The chief adulteration, it is stated, is the use of leaves other than those of the tea plant, such as willow, poplar, plane, oak, hawthorn, sloe, beech, elder, and elm leaves. In the same volume, on p. 112, as the result of the analyses of 35 *samples of imported tea*, made by your investigator, 12 were found to be adulterated with black lead and nine were found to be composed of exhausted tea leaves and colouring matter. Of 24 other samples, purchased from dealers, four were found to be adulterated. On p. 136 of the same volume it is mentioned that the colour of "green tea" is very frequently imparted by artificial means, Prussian blue, mineral green, and other dyes being used. Various tables relating to the constituents of spurious tea which had been seized by the Custom House officials are given in this article. On p. 161, a simple means by which to discover whether tea has been artificially coloured or not is set out, and the results of microscopical and chemical analyses made by your commissioner of 36 samples of green China tea show that the *whole* of the samples were adulterated. On p. 210 of the same volume the microscopical and chemical *analyses of 20 samples* of green tea are given. All were adulterated.

This able report concludes by referring to the adulteration of tea by the Chinese and gives illustrations of the structure of the tea plant, microscopical and botanical, and ends by proposing as a remedy for this fearful adulteration a reduction of tea duty, which would extend the consumption of tea, and in all probability, as you suggested, increase rather than decrease the revenue, and it has so turned out.

There can be no doubt that this exposure, the first ever made, of the adulteration of China tea in those days led directly to the passing of the Food and Drugs Act, which, as you state, has proved to be a measure which has since prevented effectually the sale of adulterated tea in the United Kingdom. It is a curious coincidence that the introduction of Ceylon tea into this country dates from the same year—1875—and that now 33 per cent. of the whole of our tea import comes from Ceylon, and has never been charged in any way with adulteration. The same may be said about Indian tea, of which 58 per cent. of *all* our tea imports are at present used. Quite the reverse has happened in the case of China tea. At the time of your report, in 1851, and for a much later period, 1866, China supplied 90 per cent. of the tea used in this country. To-day not more than 5 per cent. is used. This is a very curious result of the alleged abolition of adulteration of China tea, and one feels greatly relieved to know from your columns that no filthy processes are now used in the manufacture of China tea.

I am, Sir, yours faithfully,
THEA SINENSIS.

August 31st, 1908.

THE MEDICAL DIRECTORY.

To the Editor of THE LANCET.

SIR,—On Sept. 1st we posted to each member of the profession our sixty-fifth annual circular. Will you kindly allow us, through your columns, to ask for its early return to us? If by any chance a practitioner has not received the form we shall be glad to send one on application. It is particularly requested that the necessary alterations from Volunteer appointments to the Territorial Force should be accurately stated.

We are, Sir, your obedient servants,
THE EDITORS OF THE MEDICAL DIRECTORY.
7, Great Marlborough street, London, W.

THE WASHINGTON INTERNATIONAL CONGRESS ON TUBERCULOSIS.

(FROM OUR SPECIAL SANITARY COMMISSIONER.)

THE MEDICAL PRESS AND THE ORGANISATION OF INTERNATIONAL CONGRESSES.—PRACTICAL LEGISLATIVE REFORM AND THE LANGUAGE DIFFICULTY.—THE EXCURSIONS AND ENTERTAINMENTS.—THE CUMBERSOMENESS OF THE LOCAL CONTINGENT.

THERE is a regrettable delay in the issuing of the final programme of the forthcoming International Congress on Tuberculosis. *As this time the congress meets at Washington* it will be far removed from the usual beaten track followed by such gatherings. The holding of an international congress is a technique in itself, and a generation is arising of specially qualified organisers both in the ranks of honorary secretaries and of paid clerks and employees. These latter travel *from city to city* and make their livelihood in organising and managing the bureaucracy which is so important and indispensable a part of a congress, but more especially of an international congress. It is no easy matter to reply to several thousand persons writing from all parts of the world; often asking for the most minute details, not merely in regard to the discussions and the papers which they want to read or to hear but in regard to personal *arrangements*, hotels, food, the sort of clothes that should be worn; whether there are *spring mattresses* or feather beds; whether the water is drinkable or whether they must bring *filters with* them; whether it is the custom to "tip" waiters, and if so at what percentage on the expenditure; these and many other odd questions flow in. It would require a large and very well-informed staff to reply to each person individually. Thus early in *the history of international*, and even of national, congresses it became obvious that much trouble would be saved by issuing a small practical guide answering beforehand all the questions likely to be asked.

Then there is the organisation of the general and sectional meetings and the requirements formulated by the International Association of the Medical Press. These are all the more necessary, as when the International Congress of Hygiene met at Budapest in August, 1894, the French and British representatives of the medical press had made all the necessary arrangements for a press strike so as to persuade the managers of the congress to afford the necessary facilities, otherwise it would have been impossible for the press to describe the proceedings in an adequate manner. It was at the meeting of the committee of the International Association of the Medical Press which was held at Berne in April, 1905, that a series of suggestions or rules were drawn up for the guidance of organisers of international congresses. Thus it was then pointed out that there should be a press room where journalists could work quietly. An inflexible doorkeeper was to exclude all but journalists and to be *specially* careful in preventing the entry of exhibitors and business men generally who are ever *hungering after* gratuitous advertisements and had rendered the press room at the Madrid International Congress of Medicine in 1903 a perfect pandemonium. On the other hand, close to the door of the press room there should be a number of pigeon-holes, one for every accredited journal, where letters marked "Press Bureau" and other communications could be left for its representative. If exhibitors and others are allowed into the press room *to interview* journalists and to attempt to persuade them to go to look at their exhibits, or members of the congress call in because they are anxious to have notices of their papers and speeches, there is an end to all quietude and it is impossible to work. A "silent" room for journalists is the first requirement.

Over and above the general card of membership there should be a special card for journalists and there should be a reporters' table in *each meeting* room or hall where none but the bearers of such cards should be allowed to sit. As the congresses are divided into many sections—there will be seven sections at Washington—no journal can be represented in each section. Especially is this the case when the distance and the expenses are great. No European paper will send seven correspondents to Washington and even the American papers are not likely to

Communications, Letters, &c., have been received from—

Cheques and Post Office *Orders* (crossed "London and Westminster Bank, Westminster Branch") should be made payable to the Manager, Mr. CHARLES GOOD, THE LANCET Office, 423, Strand, London, to whom all letters relating to Advertisements *or* Subscriptions should be addressed.

THE LANCET can be obtained at all Messrs. W. H. Smith and Son's and other Railway Bookstalls throughout the United Kingdom. Advertisements are also received by them and all other Advertising Agents.

Agent for the Advertisement Department in France—J. ASTIER, 31, Rue Bapst, Asnières Paris.

French speakers present on that occasion. The members of the French medical profession will find it difficult to comprehend French as it is spoken in French Canada and they will be less likely to understand English as spoken in Massachusetts. The Boston organisers will, however, doubtless make a point of calling upon Bostonians who know French to help.

The great secret of success in all these matters is to limit the numbers. Such Congresses as those of Medicine or Hygiene are actually menaced with extinction because they are too numerously attended. It was said that, all told, some 7000 persons went to Madrid in 1903 for the International Congress of Medicine and there were only four first-class hotels in the town. It was thought that by specialising the congresses the number of members might be reduced, but to judge by the formidable lists published there is some danger that an unmanageable crowd will assemble at Washington. Above all, a method must be devised to reduce the number of native members, for, being close at hand, they can easily attend. It does not cost them as much time or money, so they come in great masses, though in spite of their numbers they can but represent one voice in the congress—that is to say, only one nation among the many nations. Then it requires a very strong chairman to prevent these numerous inhabitants of the country from speaking too often. The chairman has to insist that those who represent other nations shall have an equal hearing and that other languages than that of the place where the congress meets shall be heard just as readily; indeed, if any preference is shown it must, of course, be to the guests. If this is not done, and with a strong hand, an international congress will soon degenerate into a national congress. Eminent men, some coming from great distances, have to give way to local nobodies and abandon the meetings, and the whole thing ends in failure. This I have seen on more than one occasion, and this time it has occurred to me that, instead of criticising after the event, it might be more useful to point out what are the difficulties while it is still time to take measures so that they may be overcome.

THE REVIVAL OF CHOLERA IN RUSSIA.

(FROM THE BRITISH DELEGATE ON THE CONSTANTINOPLE BOARD OF HEALTH.)

THERE has recently been a serious revival of cholera in Russia. Last year, it will be remembered, the disease became epidemic in the valley of the Volga early in July and thence spread very widely throughout European and Asiatic Russia, causing a large total mortality, though with few exceptions not producing an alarming epidemic in any particular town or district. The outbreak was reported to have come to an end some time in January last and for about six months the whole country appears to have been free from cases of the disease. The present revival of cholera seems to have begun a little later than last year's outbreak. Detailed information as to its origin is as yet wanting and there is some confusion in the returns both as to dates and as to numbers of cases and deaths. But information officially communicated to the Board of Health at Constantinople indicates the course of the epidemic.

On July 8th (21st) a labourer who had come from Baku died in hospital at Astrakhan from true cholera; on the same date a local resident in Astrakhan also fell ill of the disease. The subsequent returns have been rather confused; from July 8th (21st) to 15th (28th) there were 15 cases and 7 deaths. On the 19th (August 1st) 4 new cases and 2 deaths occurred; on the 20th (August 2nd) there were 7 cases and 2 deaths; and the totals from the beginning were put at 42 cases and 19 deaths. On the 22nd and 23rd (August 4th and 5th) there were 8 fresh cases and 7 deaths, and on the 24th (August 6th) as many as 22 new cases with 4 deaths. On the 25th (August 7th) a fatal case occurred "in the roads on the Caspian Sea," presumably on a ship.

In the meantime the disease had been spreading in the Astrakhan government. 2 cases and 1 death occurred (date not stated) in the Tsarevo district, and one fatal case on the island of Zaiatz. In the whole government 34 cases of cholera with 16 deaths occurred between July 8th (21st) and 19th (August 1st). On July 22nd and 23rd (August 4th and 5th) there were 16 cases and 3 deaths; on the 24th (August 6th) 10 cases and 5 deaths; and the totals from the beginning were put at 105 cases with 40 deaths. Another return stated that between July 20th and 25th (August 2nd and 7th) there were 92 cases and 38 deaths in this government. On July 27th (August 9th) there were 36 fresh cases here with 26 deaths.

The Saratof government lies immediately to the north of that of Astrakhan. The town of Tsaritsyn seems to have been the first infected. On July 11th and 12th (24th and 25th) there were 11 cases of cholera here with 8 deaths, and on the first-named date 5 cases with 3 deaths were removed from boats arriving at Tsaritsyn (presumably from Astrakhan). By July 13th (26th) there had been 25 cases and 14 deaths. On the 18th (31st) there were 22 new cases and 12 deaths; on the 20th (August 2nd) 11 cases and 6 deaths; and on the 21st (August 3rd) 17 cases with 10 deaths. The totals up to the last-named date were 113 cases and 55 deaths. In addition, 4 cases with 2 deaths occurred in the Tsaritsyn district before July 18th (31st) and 8 cases with 3 deaths in the same district on the 22nd (August 4th). One case was seen in the Balashef district at some date unnamed; 1 fatal case was recorded in the village of Otradni on July 11th (24th); and in the town of Saratof there were 2 cases on the 18th (31st). 3 cases were removed from ships on the river on the same day; 3 more cases occurred on the 19th (August 1st); 4 cases with 1 death on the 20th and 21st (August 2nd and 3rd); and 4 cases on the 22nd (August 4th).

In the government of Saratof 88 cases with 44 deaths were registered from the beginning of the epidemic down to July 19th (August 1st) and 152 cases with 74 deaths between that date and the 24th (August 6th). On July 26th (August 8th) there were 11 fresh cases and 15 deaths in this government and on the 27th (August 9th) 30 cases with 15 deaths. Among these was a fatal case in the town of Kamyshin, on the borders of the Astrakhan and Saratof governments.

In the Samara government there were 2 suspected cases and 1 death in the village of Balakou on July 11th (24th). Between the 19th and 24th (August 1st and 6th) there were 4 cases with 3 deaths in the government. Some time before the 26th (August 8th) 3 suspected cases had been seen in the faubourg of Pokrovski and the village of Rozno. In the Simbirsk government 1 case was removed to the Syzran Hospital from a steamer coming from Astrakhan on July 18th (31st) and a supected case occurred in the town of Simbirsk some time before the 26th (August 8th). In the government of Kazan 2 suspected cholera cases had been recorded some time before the last-named date. So far as is known at present this is the most northerly point that the epidemic has yet reached.

Westward the infection has spread from Astrakhan to Rostof and the Don Territory. In the prefecture of Rostof-on-Don 2 cases of the disease were seen on July 20th (August 2nd); on the 22nd (August 4th) 1 fatal case occurred in Rostof itself; on the 26th (August 8th) there were 14 cases here with 8 deaths; and on the 27th (August 9th) 7 cases with 2 deaths. In Nahitchevan, close by, 1 case was reported on July 25th (August 7th). In the Don Cossack Territory there were 2 suspected cases on July 22nd (August 4th) in the village of Kalatal; between the 22nd and 25th (August 4th and 7th) 14 cases and 10 deaths were registered in the whole territory; and on the 25th and 26th (August 7th and 8th) 2 cases with 3 deaths.

On July 26th (August 8th) 2 cases of cholera were seen at the station of Taganrog; they had presumably brought the infection from Rostof. At Novorossiisk, on the Black Sea coast, a suspected case was seen on August 1st (14th); the diagnosis of cholera was subsequently confirmed but the patient recovered. On August 4th (17th) 2 suspected cases were observed at Ghelindjik, situated 40 kilometres from Novorossiisk. Finally, a case of cholera was imported to Baku from Astrakhan on August 1st (14th) and on the following day a fatal case occurred there in a local inhabitant; and from Tiflis the Turkish Consul reports the occurrence on July 24th (August 6th) of a suspected case.

It will be seen from the above that information on the course of the outbreak is in many instances very incomplete and spasmodic. The totals for the whole country have been stated to be as follows: between July 8th and 19th (July 21st and August 1st) 93 cases and 47 deaths, and situation always rupture, but when they do rupture they lead to rather striking post-mortem appearances. Those of you who saw the post-mortem examination of this case will remember the appearance. And their peculiarity lies in this: that although these aneurysms are only covered by a very delicate membrane, in the majority of cases the pia mater is not ruptured and the blood is extravasated between the membrane and the surface of the brain, and the remains of that you can still see here. Not uncommonly the big vessels of the base, the basilar or some other big vessel, is imbedded in a blood-clot half an inch thick. This blood is extravasated all over the base, from the optic chiasma backwards, and then it passes up the side of the pons, the side of the medulla, and so gets into the fourth ventricle, and in that way it passes through the iter through the third ventricle, and so into the lateral ventricles. Those of you who saw the necropsy on this case will remember that when the brain was sliced open the ventricles were full of blood, as full as they very well could be. It is difficult at first to believe that all that hæmorrhage in the interior of the ventricles can be derived from hæmorrhage on the surface of the base of the brain. This specimen has been carefully dissected by Mr. T. W. P. Lawrence, and he has shown that there is no other rupture and that the whole of the blood in the ventricles has been derived in the way I have described—namely, by passing up the side of the pons, up the side of the medulla, and so getting into the fourth ventricle and so on. It is very extraordinary, when you consider the pressure inside these vessels, and when you consider that they are only covered by a thin layer of pia mater, that with the rupture of an aneurysm the pia mater does not usually rupture, and that there is no blood extravasated into the subdural space. Subdural extravasation is a most exceptional thing. I have never seen it in the instances of aneurysm of this kind which have fallen under my notice.

There is another form of rupture which may occur, and that is the aneurysm may become adherent to the cerebral substance and give rise to intracerebral hæmorrhage which bursts into the brain matter and not externally. You will understand that I am talking all the time of aneurysms of the vessels at the base of the brain. But, of course, these aneurysms do not by any means always rupture. Sometimes they give rise to other effects. They may reach such a size as to press on the cerebral structures and cause cerebral softening, and not bring about death by rupture. A few words with reference to the incidence of these aneurysms. They may occur almost at any time of life up to extreme old age, but the bulk of them occur in the first half of life, before the fortieth year, and a very considerable proportion of them occur between the twentieth and the thirtieth year. They have been known to occur in childhood, and in persons between 20 and 30 years of age they are fairly common comparatively. There are a few isolated instances on record where the disease has occurred even before the tenth year of life. But the main interest in the clinical picture which I want to draw lies in the group of cases where this condition occurs in adult life from 20 to 30 years of age. In the case of people over 40 years of age there is not so much interest in the etiology or clinical course of aneurysm as there is in the occurrence of the disease in those who are younger. I will not waste your time in discussing the pathology of the condition, but will simply draw your attention to the fundamental point that aneurysm is the result of local disease of a vessel wall; that lies at the root of the pathology of the disease; it is the striking difference between aneurysm and arterio-sclerosis. It is a manifestation of a local disease, often of a patchy disease. The local disease is, in a very large proportion of cases, atheroma, and is atheroma of no doubt syphilitic origin, and we think that in the case of cerebral aneurysms their causation by syphilis is, if anything, a more definite characteristic than it is even in such aneurysms as those of the aorta. In all the cases here where a history was obtainable there was no difficulty in tracing the syphilitic infection. So much is that the case that you might make a more general statement and say that in aneurysms involving the large vessels in young persons the probability of the condition being syphilitic is great. But bear in mind that in the case of the cerebral vessels, great as is the part played by syphilis, there is another factor which does not play any considerable part in the production of aneurysms elsewhere—that is to say, the factor of embolism. You never think of embolism as a possible cause of aneurysm of the aorta or the more familiar forms of aneurysms with which we are concerned. But in the case of the cerebral vessels there is no question of aneurysm being sometimes dependent on embolism. And you must bear in mind that the embolism may be not only that produced by such malignant and septic processes as ulcerative or malignant endocarditis, but also that a vessel wall may be damaged by a more benign embolism than that.

You must, therefore, bear in mind that not only may the physical signs of the condition which causes embolism pass away but that it is not too far-fetched to suppose that sometimes the condition itself may pass away. A patient may get embolism from the detachment of blood clot from the interior of the heart, for example, but it does not necessarily mean the presence of valvular disease, and I do not know that one would be justified in saying that a condition like that is always persistent. My point is that a patient may die from cerebral aneurysm which may have resulted from embolism, but that at the time of his death you may not be able to find any gross evidence of its embolic origin. So that great as is the part played by syphilis in the production of cerebral aneurysm one cannot say that if a person has cerebral aneurysm it is proof positive that he has had syphilis. In my own not very extensive experience I have seen fatal cerebral aneurysm in quite young people in whom there is not the smallest reason for supposing there was any syphilitic infection. I have one case particularly in my mind, that of a young girl 17 years of age, who had cerebral aneurysm, and there was no cause found post mortem for an embolic source and where certainly if anything could be excluded syphilis could. So one must not be too dogmatic about the part played by syphilis, although the bulk of the cases, and perhaps all the cases on the table with one exception, are of syphilitic origin. And I want to emphasise the point that you can never gauge the state of the cerebral vessels from the state of the peripheral vessels. So the fact of the radial being diseased does not, unfortunately, give a clue as to the state of the cerebral vessels.

So much for the age incidence and the distribution of the lesion. Now we come to the clinical side of the subject, and I am afraid I must classify the cases. From the clinical standpoint one may recognise the following groups, I think First of all there are the cases that produce no symptoms at any time, and that group of cases is considerable. The patient dies from something else and afterwards cerebral aneurysm is found, as in this specimen. Here is a cerebral aneurysm of the size of a small cherry on the basilar artery at its bifurcation, and it was derived from a case of malignant endocarditis which never presented any cerebral symptoms. You may see aneurysms very much larger than that which have never produced symptoms and which are found in the course of post-mortem examination where the patient has died from some totally different disease. It is very remarkable that you can have a thing of that size pressing on the pons or medulla and yet the patient present no symptoms. The second group are those where the patient simply presents the symptoms of a cerebral hæmorrhage—that is to say, he has no symptoms until he gets cerebral apoplexy, which is fatal, and the case is merely one of very severe cerebral hæmorrhage, rapidly fatal. You can sometimes suspect these cases to be aneurysmal owing to the rapidity of the onset of the apoplectic state. Those cases are of no great clinical interest—they are merely cases of cerebral hæmorrhage.

There is a third group where the patient presents symptoms in greater or less degree of a cerebral tumour, and those cases are of some clinical interest from the point of view of trying to distinguish between a cerebral tumour and an aneurysm. I think they must be rare, although they are described in all books, because personally I have never come across one. I have never seen a patient who had aneurysm where the symptoms were at all really suggestive of a cerebral tumour—in other words, where there was any difficulty or doubt in distinguishing between these two.

The fourth group of cases is the one to which I particularly want to draw your attention and the one which is really my sole excuse for talking about the subject to-day. I think there is a fourth group of cases the particulars of which it is difficult to sum up in a few words. It is a class in which there is a definite clinical course and where you can hazard a diagnosis, as a diagnosis was hazarded in this she had eaten. Such cases occur with too much frequency. Food apparently wholesome has become a deadly poison, against which there is no warning or protection. It is a subject worthy of investigation, not only from its intrinsic interest but in order to prevent if possible the occurrence of the deadly change and to provide some way of avoiding a terrible danger.

Inspection of Ships and Food.

The members of the Port Sanitary Authority of Manchester made an inspection about ten days since of the places on the Ship Canal where their work is carried on. The authority consists of 13 representatives altogether—four each for Manchester and Salford, and one each for Stretford, Warrington, and districts grouped about Eccles, Runcorn, and Widnes. Mr. W. F. Dearden is the medical officer to the authority. All vessels entering the canal are inspected by the officials and their sanitary condition and freedom from disease reported on. It was thought in the early days of the canal that Manchester suffered commercially somewhat, as compared with other ports, from the regulations on the canal as to foodstuffs being more stringent than they were elsewhere. However that may be, there will from to-day be no difference, as the Public Health (Regulations as to Food) Act, 1907, comes into operation at all the ports of the kingdom. It concerns itself with the inspection of food and embodies the main principles which have guided the Manchester authority for some years past. Good arrangements have been made at the various places on the canal—as Runcorn, Port Ellesmere, &c.—for food inspection, and the people of Manchester and a wide district around have good reason to be grateful to those who carry out the powers of the authority in guarding against the introduction of unwholesome foodstuffs.

Dukinfield Corporation and Medical Fees.

At Dukinfield the highways committee of the town council has decided not to pay an account of three guineas for medical attendance on one of the corporation workmen who had received an injury. Before the Workmen's Compensation Act came into force the custom of the corporation was to pay full wages to an injured workmen and also the charge for medical treatment. Now it appears that half wages and no medical fees are allowed. When the matter was discussed in the council last night only one member, an alderman, was found to support the plea of generous dealing with the workmen. "In not meeting the doctor's bill in the case of injured employees he maintained that the ratepayers would regard it as a niggardly, parsimonious, contemptible piece of business." In spite, however, of this expression of opinion this gentleman was the only dissentient from the passing of the minutes. Should the decision of the Dukinfield council be generally followed the Compensation Act will not gain in popularity.

Whisky as Medicine.

An inquest was held a few days since in Hulme on a child aged five years. The mother said that the child had complained of illness, so she bought sixpennyworth of whisky and gave her a teaspoonful that evening and one the next morning to ease her pains. The bottle was put on the mantelshelf and sometime in the morning she found the bottle empty and the child in bed unconscious, in which state she remained until her death the day after. Dr. A. N. Benson, who saw the child on the day before her death, said that she was suffering from acute alcoholic poisoning. A juryman asked if sixpennyworth of whisky would be sufficient to cause a child's death and Dr. Benson said that there would be about six ounces in the bottle and if a child drank that quantity undiluted it would kill the child. The verdict was "Acute alcoholic poisoning by misadventure." It seems remarkable that a child should drink six ounces of undiluted whisky and that its pungency did not stop the drinking of it.

Sept. 1st.

NEWCASTLE-UPON-TYNE.

(FROM OUR OWN CORRESPONDENT.)

The Public Health of the County of Durham in 1906.

THE issue of this report was delayed by the regrettable illness of the county medical officer of health, Dr. T. Eustace Hill, which necessitated a somewhat prolonged absence from work. It is pleasing to know that Dr. Hill has now quite recovered and is able to apply himself to his duties again with all his former zeal and ability. The report is one of considerable interest, dealing, as it does, with the health of the people concerned in one of the most important industries of this country—namely, that of the Durham coal fields. The area of the county was 637,672 acres, the same as in the preceding year, and included five boroughs, 24 urban districts, 14 rural districts, and two port sanitary districts. The population, based on the rate of increase between the censuses of 1891 and 1901, was estimated to be 822,160, an excess of 10,600 over 1905. The natural increase of the population was, however, 14,546, and, further, the estimates of the district medical officers of health exceed the official estimate by over 33,000, the greater part (26,000) of this number being allocated to the rural districts. Dr. Hill appears to agree with the probability of a fallacy in the official estimate, for he says that "*owing to the prosperity of the coal trade (1906)* and the opening out of a number of new collieries it is highly probable that the population is under-estimated," and a further argument in support of the under-estimate is that afforded by the fact that a large number of new dwellings had been erected without apparently in any way reducing "the very serious over-crowding." The birth-rate for the county was 35·2 per 1000 of population, an increase of 0·8 over 1905 and 8·2 per 1000 above the average for England and Wales. In all the agricultural portions of the county the birth-rate was considerably below 30 per 1000. The death-rate was 17·5 per 1000 of population, an increase of 0·1 over 1905 and 2·1 higher than that for England and Wales. "Considering the high mortality from diarrhœal diseases during the third quarter of the year the total death-rate cannot be regarded as unsatisfactory." The death-rate in the rural districts (17·9) considerably exceeded that for the urban districts (17·3). Infantile mortality was equal to a rate of 157 per 1000 births registered, as compared with 159 and 162 in the two preceding years. "Although the county infant mortality rate has shown a tendency of recent years to progressively decline it still very greatly exceeds the rate for England and Wales, which in 1906 was only 133." The death-rate from zymotic diseases was equal to 2·40 per 1000 of population, which is rather higher than in 1905 (2·37) and much higher than for England and Wales (1·73). Enteric fever was responsible for a total death-rate of 0·22 per 1000 of population (1090 cases), which is more than twice as high as the rate for England and Wales. The total deaths from phthisis numbered 904, a rate of 1·09 per 1000 of population. In the previous year the rate was only 1·00. The deaths from other forms of tuberculous disease numbered 610, practically identical with the number in the previous year. The total death-rate from all tuberculous diseases was 1·84 per 1000 of population, which is 0·10 higher than in 1905. Malignant diseases were responsible for a death-rate of 0·65 per 1000 of population as compared with a rate of 0·58 in 1905. "Generally speaking, the water-supply to the populous districts in this county is satisfactory, but unfortunately many dairy farms in outlying rural areas are dependent for their supply on springs and shallow well-waters which are liable to serious pollution." Drainage and sewerage appear to have made "fairly satisfactory progress" during 1906, but it is evident that very much yet remains to be done. In some districts the local authorities still require to be convinced that well-constructed covered drains and sewers are immeasurably more sanitary than objectionable open channels. Dealing with factories and workshops Dr. Hill says that a perusal of the tables suggests either that the inspections made are not very frequent or minute, or else that the sanitary condition of the workshops and workplaces is very satisfactory, as the defects reported are neither numerous nor serious. This publication may be regarded as an expression of opinion by one of our ablest and most experienced sanitarians in the first decade of the twentieth century. Dr. Hill makes no rash or unsupported statements. He quotes facts or authorities and draws clearly thought out and carefully considered conclusions. The report is noteworthy for its eminent reasonableness and truth and it is to be hoped that those responsible for the conditions—such as the want of proper housing accommodation, &c.—which Dr. Hill on irrefutable evidence shows should not be, will read this report carefully, for it teaches its own lesson. Bad housing may appear cheap but the apoplexy. This patient for a fortnight presented no fresh symptoms, then one day he wished to pass a motion, and subsequently to that, or whilst in the act of passing it, he called out to the sister, and was dead in a few minutes; very probably the rupture occurred during the straining at stool. Other patients have suddenly sat up in bed, called out, and fallen back unconscious and died. But in a number of the cases death does not occur quite as rapidly as that. The patients become profoundly unconscious, respiration becomes more and more irregular, and finally it ceases, and yet the pulse goes on beating vigorously. I have met with instances where artificial respiration has been carried on for three or four hours in these cases, the heart beat going on all the time. I think, however, that they are really quite hopeless. It has been suggested that trephining might be done to relieve the tension while artificial respiration was being performed. These cases run a slightly different course from the ordinary cases of cerebral hæmorrhage, in the extraordinary way in which the respiration is arrested and the pulse continues. That is the clinical picture, then, of this group of cases. As I said at the beginning, I think they form a very definite group of cases, characterised by these phenomena: (1) that there is an early seizure followed by (2) a period in which there are no marked symptoms of any kind, perhaps with the exception of some stiffness of the neck, and (3) subsequently there is a fatal seizure.

In some of these cases, as in the last one, optic neuritis is present. I am told that this last patient had optic neuritis in the left eye. Optic neuritis has been described, of course, in a considerable number of cases of cerebral aneurysm. Those are the points of main interest about these cases, and the only thing in addition which I will say about this particular one is that we got as far as hazarding a diagnosis of basilar aneurysm on account of the curious seizure which he had. But at the bedside I could not myself account for his sudden loss of sight; I could not correlate the general weakness of his four limbs with the loss of sight in the right eye. That was due to lack of knowledge on the subject, because it is one of the features which have been described a considerable number of times, and there are two or three specimens in the museum which illustrate pressure on the optic nerve. But the curious thing in this case—showing how different the real thing in clinical medicine is from the artificial things which are sometimes detailed for teaching purposes—is that this man's aneurysm came from his left anterior cerebral, and yet the optic nerve that was involved was that of the right eye. The aneurysm crosses the middle line and apparently presses on the right optic nerve. I fear that you cannot see that in the specimen now, because the part of the optic nerve which was probably pressed on by the aneurysm has been left in the body.

What is the explanation of the two seizures which occur in these cases? One can only hazard a guess, but I think that probably first of all a slight rupture occurs and then a big and fatal rupture; the first seizure is due to a slight rupture and the fatal seizure is due to a second rupture. In this case the brain afforded some evidence of that, and it is the first time I have seen evidence of it, in the fact that all round the optic nerve and on the surface of the base of the brain there was a considerable amount of staining which might have been due to old blood clot which had been absorbed and the recent blood clot covered the whole thing over. In many of these cases the blood clot formed by the final rupture is so extensive and firm that it is only with the greatest difficulty you can find that there actually is aneurysm, only by washing away the clot for a long time that you can find the seat of the hæmorrhage. Another curious thing about this case is that this aneurysm on the anterior cerebral had, on the one hand, pressed into the brain, although it does not look a big aneurysm, and that it was projecting into the anterior extremity of the lateral ventricle. On opening the ventricle and looking down you can see the sac at its anterior extremity not ruptured, the blood clot in it showing through. So this aneurysm, although it had reached the ventricle, yet when it ruptured it did not rupture into the ventricle but in the way I have described—that is to say, externally, beneath the pia mater.

Those are the main points which I put before you. As regards diagnosis, I doubt very much whether you can diagnose with certainty aneurysm at the base of the brain, but at any rate you can suspect it, and that is what I wanted to bring before you, and I certainly think that the clinical picture I have tried to put before you is one which is true to the condition and is one which will enable you to suspect its existence in a patient.

Now, what is it liable to be confounded with? The condition which it is most likely to be confounded with, as far as my own experience goes, is a purely functional condition. Such a person is often supposed to be neurasthenic. Of course the cases which make the greatest impression upon one are often those where errors have been made, and I remember a case I saw once, the man being a stockbroker who had lost much money on the Stock Exchange and took to drinking. After a drinking bout he had a vague seizure such as I have described, and I saw him a few days afterwards, when there was nothing to be made out except that his extremities were rather weak and that he had some stiffness in his neck and occipital headache. It was thought by some to be obviously a case of neurasthenia; the idea that there was any organic disease was laughed at, because the man was apparently perfectly well. Three or four days after I saw him he sat up suddenly in bed and called out, and then fell back dead. He had one of these aneurysms. That is a most serious mistake, and it is one I want to warn you against making, because occipital headache, extending down the back, stiffness of the neck, and numbness of the extremities are sometimes features of neurasthenia, and therefore you might make the mistake. The absent knee-jerks may help you. The other errors of diagnosis are not important. It is not a serious matter to confound aneurysm with tumour or with meningitis or with any other fatal disease. The serious mistake is to confound the disease with a functional one, and that is what you are extremely prone to do, owing to the fact that when you see the patient the probability is that you will not find any very obvious signs, and such signs as may be present require careful investigation for their detection.

AN EXTENSIVE ENTERECTOMY FOR GANGRENE.

BY ARTHUR E. J. BARKER, F.R.C.S. ENG.,
PROFESSOR OF SURGERY AT UNIVERSITY COLLEGE HOSPITAL MEDICAL SCHOOL AND SURGEON TO THE HOSPITAL, CONSULTING SURGEON TO THE QUEEN ALEXANDRA MILITARY HOSPITAL, MILLBANK, S.W.

THE following case is one which has had many points of deep interest to myself in its history and treatment and may be as encouraging to others as it has been to me. It illustrates, besides, several of the good features of spinal analgesia in the clearest way. I have a strong conviction that this method of allaying pain was far more suitable to the case in hand than would have been any other general anæsthetic, and that by employing it some of the great risks commonly run in such operations were avoided.

The patient, a married woman, aged 47 years, who had had no children, had three years ago an attack of inflammation of the right ovary but no other illness. There had, however, been chronic constipation. On Sunday, March 29th last, she had tinned salmon at breakfast and meat-pie at early dinner. At about 2.30 P.M. she was seized with violent pain in the abdomen. During the afternoon she vomited once or twice and brought up undigested food. She had had a small, hard motion on Sunday morning. Confection of senna was taken on Sunday afternoon subsequently to the onset of the pain. The patient was seen at about 9 P.M. on Sunday evening by Dr. J. A. Belcher of Herne Hill and was then in great pain. The abdomen was flaccid but tender on deep pressure in the right iliac fossa. The pulse was 60 and of full volume. The temperature was normal. She was given chlorodyne, 20 minims every four hours. She was seen again by Dr. Belcher at 11 P.M. when the pain was still unrelieved. A quarter of a grain of morphine was given hypodermically. On Monday morning the patient said that she felt better and had had some sleep. The expression was, however, bad and the hands and face were cyanosed. The pulse was small at 130. The temperature was still normal. The abdomen was now much distended and very tender and there was dulness in the right iliac region. The case was regarded as probably one of appendicitis with perforation and I was sent for.

guineas from an anonymous subscriber. The board of management is to be congratulated upon the economical working of the institution as shown by the statement in the last annual report that in 1907 the average weekly cost for provisions was 5s. 8d. per head, and this amount was higher than it would have been but for the higher price, amounting in the aggregate to £155, which had to be paid for milk on account of the stringent regulations enforced by the board in order to insure a pure supply.

Health Report of Cardiff.

For many years past the medical officer of health of Cardiff (Dr. E. Walford) has added very much to the value of his annual report by including statistics which relate to a period extending over a considerable number of years, since the time, in fact, when the population of the town was just over 20,000, or about one-tenth of what it is at the present time. The report for 1907, which has just been issued, shows that in the middle of the last century there was a birth-rate of 44 per 1000, a death-rate from all causes of 29 per 1000, and a zymotic death-rate of 8·6 per 1000. The respective rates in 1907 were 26, 15, and 1·9 per 1000. Certain portions of the town are very crowded with houses, but strangely enough this fact is not reflected in the death-rates. For example, in East Cardiff there are 124 persons per acre and a death-rate of 11·5 per 1000, while in West Cardiff with 30 persons per acre the death-rate was 12·5 per 1000, and in Central Cardiff with only 15 persons per acre it was 15 per 1000. The population of each district is about the same. It would be of interest to have from Dr. Walford some explanation of these figures which are contrary to what would be expected. The infantile mortality rate in Cardiff—131 per 1000 births—is still high in spite of the excellent work that is being done by the health visitors. Dr. Walford considers that in any scheme for reducing the rate of infantile mortality the health of the mother during pregnancy must be taken into consideration and measures at present adopted must be extended so as to include instruction to pregnant mothers in the preservation of their own health as well as that of their children. He also advocates a further development of the present system of visits by women inspectors; a better control and supervision of the milk supplied to infants artificially fed; special attention to the cleansing of streets and the flushing of street gullies, and the removal of all offensive accumulations during the summer months; the adoption of the sanitary clauses of the Public Health Acts Amendment Act, 1907, and the revision of the regulations under the Dairies, Cowsheds, and Milkshops Orders. It has been the custom for some time in Cardiff to take a certain number of samples of milk for analysis unofficially, that is to say, the exact methods laid down in the Sale of Food and Drugs Act have not been complied with and the dealer does not know, therefore, that the samples are being taken for analysis. It is a little disquieting to find that of the samples thus obtained 31 per cent. were adulterated compared with 8·5 per cent. of the samples officially taken and concerning which prosecutions could be instituted.

The Falmouth Hospital.

In February last the Falmouth Hospital had a deficit balance of £65. Mr. R. Davey of Falmouth offered to subscribe half of that amount if by the end of June the other half had been raised. The president issued an appeal and by June 30th £158 had been received. This with Mr. Davey's gift gave the institution a substantial balance which is much appreciated by the committee as the ordinary income of the hospital is never sufficient to meet the expenditure.

Sept. 1st.

SCOTLAND.

(FROM OUR OWN CORRESPONDENTS.)

Motor Disaster near Fort Augustus: Serious Injury to a well-known Medical Man.

A TERRIBLE motor-car accident occurred on August 18th at Inchnacardoch, about two miles from Fort Augustus, which resulted in the death of Robert Hamilton, a chauffeur, and serious injury to Dr. John Kerr of Inverness. It appears that the car, which was a 10–12 h.p. "Swift" and quite new, left Inverness in the forenoon for Fort Augustus. All went well till Inchnacardoch was reached. There while descending a rather steep brae approaching a small bridge the car failed to take the curve, and striking the parapet of the bridge dashed over an embankment and fell a considerable distance. Hamilton was killed instantaneously, and Dr. Kerr was badly injured and rendered unconscious. Dr. Kerr was conveyed in a shooting tenant's car to the Lovat Arms Hotel, Fort Augustus, where he was soon attended to by his brother, Dr. G. W. E. Kerr of Inverness, and by Dr. J. Luke. Dr. Kerr returned from South Africa a few years ago. The deceased chauffeur, who was only 22 years of age, was a native of Stranraer and was recognised as a careful driver.

Aberdeen Royal Infirmary Milk-supply: Charge against the Dairyman.

Under the Sale of Food and Drugs Act Andrew Anderson, dairyman, Newmachar, was prosecuted in the Aberdeen sheriff court on August 20th. The charge was that on July 21st he sold and delivered to the Aberdeen Royal Infirmary 60 gallons of sweet milk in terms of contract with the directors of that institution, which, on analysis, was found to be not of the nature, substance, and quality of the article contracted for, in respect that it was found to contain not more than 2·70 per cent. of fat, being a deficiency of 0·30 (or 10 per cent.) of fat, and of 0·21 (or 2¼ per cent.) of solids other than fat, under the standard fixed by the Board of Agriculture. The evidence showed that the samples were taken by means of a "dipper" after stirring, whereas the Board of Agriculture suggests that the most correct and most certain method of taking samples is by a glass tube, or if that is not available that the milk should be mixed thoroughly by pouring from vessel to vessel and then "dipped." The sheriff on these grounds found the charge not proven.

Sept. 1st.

IRELAND.

(FROM OUR OWN CORRESPONDENTS.)

*The Campaign against Tuberculosis.**

ON Thursday, August 27th, the Countess of Aberdeen presided in Dublin at a conference of delegates forming the Tuberculosis Exhibition Consultative Committee in connexion with the Women's National Health Association of Ireland. There were also delegates present from the various urban and district councils of Ireland, as well as from the various organisations working in the anti-tuberculosis campaign, so that the assembly was a very representative one. Lady Aberdeen gave an interesting account of the work of the Exhibition during the past year, saying that it had visited 67 districts in Ireland and that the total estimated attendances at the lectures was 550,000, while many for want of room were crowded out. Over 300 set lectures were given at the exhibitions, and in addition every form of demonstration was employed, and there were also quiet talks to the public individually in order to bring home the truth about tuberculosis. Lady Aberdeen emphasised the unanimity that had prevailed amongst all classes and creeds and conditions in joining in the great movement on behalf of their country. She also mentioned that at the Washington Congress on Tuberculosis a prize would be given to the society that had done the most effective work against tuberculosis since 1905, and her apology for having worried the local secretaries of the various exhibitions held all over Ireland for details and estimates must be that in their name she was applying for this prize. Sir Otto Jaffe, an ex-Mayor of Belfast, moved and Dr. S. Agnew, medical officer of health of Lurgan, seconded a unanimously adopted proposal that the report should be received, printed, and circulated. Lady Aberdeen then said that with reference to the future they proposed to have a Tuberculosis Crusading Van to go round the remoter villages and those outlying parts of the country where the people could not be reached in any other way, and towards the expense of this Captain Wilkinson, on behalf of the trustees of the Pembroke Irish Charities Fund, had sent her a cheque for £500. The van was purchased and would soon begin its surgeon's point of view. All pain vanished within a couple of minutes of the spinal injection and the paralysis of motion followed rapidly. The abdominal walls were relaxed and absolutely still, which greatly facilitated operation. There was no increase of shock from the anæsthetic or the operation, and before the patient was off the table, on which she was left for a couple of hours, the pulse was good. Nor was there any consecutive shock later. This is so frequently the case in severe cases operated on under spinal analgesia as strongly to encourage us to employ this method. And although I regard this case as the most striking illustration of its good points that I have seen in over a hundred abdominal operations under spinal analgesia it does not stand alone. Of course the severe shock before the operation due to the acute strangulation of so large a portion of the small intestine might be expected to disappear to a great extent with the release of the latter, and the improvement after this operation was doubtless in part due to this. But it may safely be said that here the form of anæsthesia employed did not add to this shock.

In conclusion, it must not be forgotten that the early diagnosis of the gravity of the condition made by Dr. Belcher and his prompt action contributed, perhaps, more than any other factor in the saving of this patient's life. A letter from Dr. Belcher of a week or two ago describes the patient as now quite well in every respect at the end of six months.

Harley-street, W.

EXOPHTHALMIC GOITRE: A DISCUSSION ON ITS PATHOLOGY AND TREATMENT.[1]

BY A. GORDON GULLAN, M.D. LOND., M.R.C.P. LOND., F.R.C.S. ENG.,

SENIOR PHYSICIAN TO THE LIVERPOOL STANLEY HOSPITAL AND LECTURER ON CLINICAL MEDICINE, UNIVERSITY OF LIVERPOOL.

THERE are several instructive and noticeable facts to be gathered from the etiology of exophthalmic goitre. Firstly, it mainly affects women between the ages of 16 and 40 years—i.e., at the period of sexual vitality—and is rare before puberty and after the menopause. Of 495 cases compiled by Buschan, only 15 were under the age of ten years and only 31 were over 50 years of age. Of my own cases only one, a girl, aged nine years, was affected before puberty and my oldest patient was aged 47 years. In this respect Graves's disease differs considerably from myxœdema, as that disease, though present at any age, is much more frequent before puberty in the form of cretinism and later in life after the menopause. This disease, too, like myxœdema, is rare in men—only two of my patients were males. Ord and Mackenzie give the proportion as 20 to 1, which is probably correct, though many writers give a lower ratio.

The disease may occur in members of the same family and, indeed, in several generations. Five of my cases gave a distinct history of several members of their family being affected with the malady. For instance, two patients were sisters, and their brother, who had previously died from "consumption of the bowels," was affected in the same way. This consumption of the bowels may have been the diarrhœa of Graves's disease. Another patient's maternal aunt had been similarly affected; and two other patients had sisters affected with Derbyshire neck (cystic goitre). One of these, a woman, aged 30 years, had two sisters who resembled her in feature and stature; one, aged 28 years, showed early signs of this disease; and the other, aged 33 years, had a large cystic goitre but manifested no other symptoms. I must also mention Oesterreicher's well-known case, where a woman had 10 children, eight of whom suffered from exopthalmic goitre, and one of the latter had three children similarly affected.[2]

The illness is often consequent upon fright, mental shock, worry, or prolonged mental strain; or appears to date from an acute illness such as influenza. Thus in my cases one patient dated her illness "to a fright whilst pregnant;" another "to worry over a tobacconist business;" a third "to a family worry, her husband being out of work;" and three others give "worry over family matters" as the cause. The acute symptoms in another case, a nurse, followed an operation for acute appendicitis and the development of a patch of phthisis in her right lung, but some exophthalmos had been noticed in a slight degree for some months previously. This patient's sister also suffers from marked Graves's disease. The remainder of my cases gave no definite cause for the disease and stated that it came on gradually, generally saying that one or other prominent symptom developed some time before the rest. Intense grief and profound emotional disturbance have long been recognised as the cause of an acute attack, but it appears to me that in most, if not all, the instances where worry or fright is stated as the cause, these mental conditions are really *post hoc* and not *ante hoc*. I mean that the disease was present, perhaps in a latent or mild degree, at any rate in so slight a degree that the patient was not aware of its presence, before that mental strain occurred, and then owing to the nervous temperament, which is one of the strong characteristic conditions of the disease, she succumbed to the "worry or fright" in an abnormal degree, and consequently dates the onset of her illness from that time. In the case of the nurse mentioned above, I am confident that for some time before her mental shock some degree of Graves's disease was present. Quinsy has been mentioned as an antecedent. I have seen it present in several of my cases during the illness.

We must now turn to the interesting and debateable field of the pathology of this disease. The thyroid gland from a case of exophthalmic goitre shows marked changes, the cells have become columnar instead of cubical, the vesicles stellate instead of square or rounded, and a mucous substance instead of a colloid fills those vesicles. Mr. Walter Edmunds, after removing the greater part of the thyroid from a dog, found that the small part which he had left underwent changes of the nature of a compensatory hypertrophy, which is practically indistinguishable in its features from those I have just described.[3] These facts are strongly suggestive that the goitrous change of this disease is due *to a true hypertrophy which produces an increase of the specific secretions.* Furthermore, in support of this view is the strong similarity of exophthalmic goitre to the symptoms of thyroidism, or hyperthyroidism, produced experimentally in animals, or by over-dosage of thyroid extract in man. Mr. Edmunds has again rendered valuable aid to our knowledge of the pathology of Graves's disease by showing that if monkeys or dogs are fed with large doses of thyroid there results accelerated action of the heart, increased metabolism, loss of weight, increased action of the skin, and sometimes marked exophthalmos; indeed, all the symptoms of Graves's disease, including exophthalmos, can be produced in animals by the administration of large doses of thyroid gland. All these symptoms, with the exception perhaps of the exophthalmos, are produced in man by the excessive administration of thyroid, and are not infrequently seen when treating myxœdema. A patient of mine, a cretin, became irritable and fretful, with rapid action of the heart, raised temperature, moist warm skin, and flushing of her face when the dose of thyroid extract was raised to 12 grains per diem; all the symptoms quickly subsided on the withdrawal of that drug.

Again, in support of the contention that the disease is due to excessive activity of the thyroid (thyroidism) is the fact that the manifestations of exophthalmic goitre are the exact opposite to those of myxœdema, which disease is undoubtedly due to a deficiency of thyroid secretion (athyroidism). The low ebb of metabolism in myxœdema is clearly indicated by the infrequent low tension pulse, feeble cardiac action, mental and physical hebetude, subnormal temperature, dry swollen skin, constipation, diminution of the excretion of urea, and increase in body-weight. Whereas excessive metabolism is shown in exophthalmic goitre by the frequent raised tension pulse, accentuated action of heart, mental and physical condition active and alert, temperature inclined to be raised, moist skin, looseness of the bowels, increased excretion of urea, and loss of body weight. How the thyroid secretion modifies metabolism is still rather doubtful. It certainly has an action on bodily growth, as shown by its

BERLIN.

(FROM OUR OWN CORRESPONDENT.)

The Medical Society.

AT a recent meeting Dr. Mendel reported the case of a woman, 30 years of age, who suffered from pains in the chest and in the back, formication in the legs, together with defective action of the bowels and of the bladder; the patellar reflexes were increased; walking and standing were impossible. The symptoms were especially marked on the right side. The spinal processes of the second to the seventh dorsal vertebræ were painful and Dr. Mendel suggested that the trouble was due to the presence of a growth in the spinal cord between the above vertebræ. An operation was accordingly performed by Dr. Adler, the result being that a circumscribed serous meningitis was discovered. The fluid was let out by an incision of the meninges and the patient made a quick recovery. The cord itself was healthy. The patient is now able to walk without the aid of a stick. Similar cases have been described by Professor Oppenheim and Professor Krause but they are very rare. At the same meeting Dr. Melchior reported some experiments on animals which he had made by inserting for plastic purposes pieces of veins into the ureter. In the dog six centimetres of the vena saphena had been inserted into one ureter and though the other kidney was removed normal urine was discharged. Three months later the dog was killed and it was found that only two centimetres space existed between the two ends of the ureter while the inserted piece of vein had become rigid. Hydronephrosis was, however, present and it must still be left doubtful whether the method is available for practical use in human beings. Dr. Sticker next read a paper on the Action of Atoxyl and Heterogenic Albuminates on Cancer. He alluded to the different methods in vogue of treating cancer, mentioning serotherapy, of which the results were hitherto not very encouraging, antifermentative therapy, where toxic symptoms may develop, heterofermentative therapy, and radiotherapy. Atoxyl, an antifermentative compound, is very poisonous and in medium doses makes the growths grow faster; very small doses are not poisonous and make the growths decrease, but they begin to increase when the administration of the compound has been stopped for some time and a blood count reveals a rather considerable leucocytosis. Concerning the administration of heterogenic albumin, especially that derived from blood, a method devised by Professor Bier, Dr. Sticker said that of all species of blood that of wethers proved especially efficacious. The injection of from 10 to 15 cubic centimetres of blood of wethers into the periphery of a cancer makes the growth shrivel and become livid and during the following days a regressive metamorphosis of the growth develops. This success is, however, only transitory, the growth increasing again and the general state of the patient becoming worse by the formation of hæmolysin. Dr. Sticker has accordingly tried to combine the administration of atoxyl and of serum and in this way has diminished the poisonous effects of the atoxyl, while the curative action of the serum was more lasting. In human beings the combined method has caused a marked improvement but no definite cure.

Lunacy in Campaigns.

At a recent meeting of the Army Medical Society Dr. Stier explained that lunacy occurs among the members of a fighting force in a relatively greater number of cases than previously. During the campaign in German South-West Africa progressive paralysis and alcoholic psychosis were especially observed. The consumption of spirits by the men should be prohibited. Also in the Russo-Japanese war the number of lunatics was relatively considerable. In a future war the following measures should be taken against lunacy: (1) the medical officers with the troops and the mobile field hospitals should be provided with hyoscine and trional to tranquillise the excited patients and to make them fit to be transported; (2) in the base hospitals a department for lunatics must be provided; (3) the patients should be conveyed home in specially adapted carriages of the hospital trains; and (4) at home sufficient places must be kept free in the lunatic asylums to receive soldiers returning from the theatre of war.

August 31st.

ITALY.

(FROM OUR OWN CORRESPONDENT.)

The Hygiene of the Mouth in Primary Schools.

OUT of 50,000 pupils in the primary schools of Milan 47,000 are more or less the victims of buccal maladies—mainly affecting the teeth. These maladies are the coefficients, if not the immediate cause, of other and graver ones which crop up in adolescence. Other Italian centres are not more free from such disease, and so throughout the kingdom a systematic effort is being made on the lines of the provisions already taken *ad hoc* by the municipalities of Zürich, Charlottenburg, and Paris. The Milanese initiative, however, has features of its own which redound to the credit of that enterprising, prosperous, and progressive city. The "Associazione per la Scuola" (School Association), composed of representatives of the family and of the teaching profession, is acting in accord with the "Istituto Stomatologico Italiano" (Italian Institute of Stomatology), and both of them with the municipality, to make a periodical inspection of the primary schools beginning with the coming scholastic year 1908–09. This inspection is to be carried out by the "Commissione d'Igiene," presided over by Dr. Ambrogio Bertarelli and composed of Dr. Bordoni-Uffreduzzi, Dr. Clerici, and other eminent consultants and practitioners of the Lombard school. Under the auspices of this commission the inspection will be performed by the specialists attached to the Istituto Stomatologico who will communicate to the parents or guardians of the children concerned the "condizioni stomatologiche" of each, illustrated with appropriate diagrams. A small fee will be expected from the well-to-do families of the children inspected, while the service will be rendered gratuitously to those of humble means. At the end of the year the Associazione per la Scuola, in concert with the Istituto Stomatologico, will present to the municipality statistical tables of the cures effected and of the results obtained. The hearty response which all Milan has made to this initiative is of the best augury, and ought to stimulate the efforts of other centres to organise similar means of protecting their children from buccal maladies (including adenoids as well as carious teeth) so prevalent at that age in Italy.

The Population of Italy.

The "Direzione della Statistica" has issued its report on the population of Italy for the last statistical year, which (such is the slowness of Italian official methods) is not more recent than 1906. For the first six months of the 12 the population numbered 33,541,094, which indicates that the mean augmentation between the two last census returns has not been maintained, thanks to the emigration chiefly from the eight provinces of Mantua, Pavia, Macerata, Campobasso, Avellino, Salerno, Potenza, and Palermo, which have a population slightly inferior to that returned by the census of 1901. The marriages contracted in 1906 were 260,780, equal to 7·77 marriages for every 1000 inhabitants. In 1905 the proportion was 7·67 per 1000. The births in 1906 were 1,070,978, or 31·93 per 1000, while in 1905 they were in the proportion of 32·51. The deaths were 696,875, or 20·68 per 1000, as against 21·80 in 1905. By the changed conditions of emigration it is calculated that the mean augmentation of the population will return to its former proportions, in which case, towards the middle of 1911, the population will reach, in round numbers, 34,500,000.

A Bearded Girl.

The hospital at Padua has just received a girl, in her fourteenth year, possessed of a beard which many a young man might envy. The patient is a native of Forcal, near Vittorio, in the province of Venetia. She is a typical specimen of the robust mountaineer, with features strongly marked and suggestive of energy, with a deep chest and broad shoulders. At the age of 12 she began to grow a beard which in two years increased so rapidly that it is now several centimetres long and gives the poor girl the look of an adult male. An inmate of the skin wards (the "Clinica Dermosifilopatica") she is described as having a luxuriant head of hair and beard of dark chesnut colour without any sign of moustaches. Her parents are agricultural labourers, and she, with her six brothers, has already worked in the harvest field. Dr. Fausto Tessaro for one relapse which passed away on returning to the same treatment.

CASE 5.—A woman, aged 40 years. The usual symptoms were well-marked, there was also considerable pigmentation of the skin and some glycosuria. She did not improve under this treatment but left *in statu quo*, except for diminution in the amount of sugar passed.

CASE 6.—A girl, aged nine years. All the symptoms were present in a moderate degree, except exophthalmos. The thyroid has become softer and smaller. The circumference of her neck diminished three-quarters of an inch and accentuation and increased frequency of the heart and tremor have disappeared under administration of rodagen.

CASE 7.—A woman, aged 36 years. There was marked improvement of all the symptoms, which were very severe, under this treatment.

CASE 8.—A woman, aged 30 years, a patient of a medical friend, was greatly relieved, all her symptoms improving when placed on one-drachm doses of rodagen thrice daily. She had previously had various other kinds of treatment without any benefit.

CASE 9.—A woman, aged 42 years, the same patient as Case 5, was readmitted into hospital in November, 1907. Pigmentation and glycosuria were still present. She was ordered half a drachm of rodagen every four hours—i.e., three drachms daily—but as she did not give evidence of much improvement five grains of thyroidectin were substituted on Dec. 22nd with marked benefit.

CASE 10.—A nurse, aged 27 years, to whom I have already referred under the heading of etiology. She had all the symptoms well developed when she was ordered five grains of thyroidectin thrice daily. She has greatly improved under this treatment. Her pulse-rate has fallen from 130 to about 90 per minute, the circumference of her neck has decreased 1½ inches—i.e., from 13 inches to 11½ inches—and the nervous tremors and exophthalmos are less marked. This is the patient whose Graves's disease is complicated by phthisis.

CASE 11.—A woman, aged 25 years, whom I saw in consultation with Dr. Gerald Wallace in April, 1907, had improved so much under the administration of thyroidectin that we gave her permission, after due consideration of the circumstances, to marry, though 12 months previously that had been quite out of the question owing to the grave symptoms present. She had gained in weight and lost her nervousness, &c., under treatment. I have recently heard from Dr. Wallace that she has been married for several months and is in good health, the improvement being maintained.

CASE 12.—A woman, aged 17 years, sister of Case No. 16, always had a large thyroid. This increased considerably in size at puberty, which took place at 15 years of age, and she then developed definite symptoms of exophthalmic goitre. She has been under treatment with thyroidectin now for some months and has shown great improvement in all directions.

CASE 13.—A woman, aged 36 years, who was under the care of a medical friend for some years, manifested the classical symptoms, she gradually got worse until given rodagen one drachm thrice daily and then steadily improved.

CASE 14.—A man, aged 25 years, showed well-marked symptoms. He had improved on thyroidectin and been able to return to work. No other treatment was given.

All these cases I have mentioned have been under my observation since November, 1905, and I will not weary you with records of my earlier cases except to mention briefly two of special interest.

CASE 15.—A woman, aged 47 years, had had exophthalmos and other symptoms for more than 25 years. She was admitted into hospital in a very nervous condition; she had slight pyrexia, sweating, dyspnœa, and tachycardia. She died four days after admission with symptoms of heart failure and œdema of the lungs.

CASE 16.—A woman, aged 30 years. This was a severe case; there was a two years' history; exophthalmos was very marked; her hair was turning white. She was in hospital for two months with some improvement when she developed an acute exacerbation of all the symptoms, with marked pyrexia, vomiting, delirium, coma, and death. Death being evidently due to a toxæmia. Progressive loss of weight, pyrexia, sweating, and diarrhœa are always bad signs.

I have not mentioned the various and numerous old methods of treatment of Graves's disease, it would take too long to discuss them. Anything which diminishes the action of the thyroid gland is beneficial, and it is probably in this way that local applications of ice and cold and the x ray treatment act. I believe that in the anti-thyroid preparations we have valuable agents for counteracting the thyroidism of exophthalmic goitre; indeed, Case 1 was apparently saved from a fatal termination by the use of rodagen, Case 2 was cured, and the other cases show good results, and I believe better results will be obtained if larger doses than those I have mentioned are used. Where benefit is not obtained I consider that the dose is too small. Thus Dr. H. W. G. Mackenzie[12] records an extremely severe case of Graves's disease which recovered from all the acute symptoms by taking one ounce of rodagen daily; and Mr. Edmunds[13] has recently recorded three cases of marked improvement treated by the fresh milk obtained from thyroidectomised goats (1½ pints per diem). Heretofore I have never given more than one drachm of rodagen four times a day, as I remembered a case of Dr. G. R. Murray's in which bradycardia and collapse with a subnormal temperature occurred during prolonged treatment with drachm doses of rodagen,[14] but in future I shall, if necessary, give larger doses with caution. The only drawback to rodagen is its price. It costs about 3*s.* 6*d.* per ounce and on that account one feels inclined to prescribe it in small doses. Indeed, recently at the Stanley Hospital I have been trying thyroidectin instead, the good results obtained in Cases 9 and 10 encouraging me to do so.

I will not refer at any length to the value of operation in cases of Graves's disease. It appears to me to be a logical and scientific method of treatment except that we cannot be certain that compensatory hypertrophy will not take place in the portion of the gland left behind. Another patient had very marked symptoms, including nervous twitching, and was quite unfit for work. She was operated upon by my colleague, Mr. F. C. Larkin, who removed a considerable portion of one lobe of her thyroid. She was considerably relieved and is able to do her work with comfort. There is, however, not the slightest doubt that serious risk is entailed, patients not infrequently dying within 48 hours of the operation from sudden cardiac failure, as if from some poison gradually absorbed direct from the thyroid.

The result of the treatment of these cases of Graves's disease with rodagen and thyroidectin will, I am sure, commend the adoption of anti-thyroid medication.

In conclusion, I would urge that when this treatment is being used a prolonged trial, with large doses if necessary, should be given, and careful observations and statistics of the condition of the patient should be noted, so that slight changes may be readily recognised. And I would impress upon the chemist the great importance of the most careful preparation and standardisation of these drugs.

Liverpool.

SOME POINTS REGARDING SPINAL ANALGESIA, WITH A RECORD OF FIFTY CONSECUTIVE CASES.

BY J. MILL RENTON, M.B., CH.B. GLASG.,
EXTRA-DISPENSARY SURGEON, WESTERN INFIRMARY, GLASGOW.

ALTHOUGH it is now fully ten years since spinal analgesia was first introduced there is still considerable difference of opinion as to the value of the method. The question of its relative safety as compared with general anæsthesia and the class of case for which it is best suited have still to be definitely settled. Most of those, however, who have had experience of the method feel that it has a definite sphere of usefulness and is one that has come to stay. The earlier records of unfavourable cases with accounts of the dangers connected with spinal analgesia have kept many from trying it at all. These dangers and bad results, however, are only those incidental to the introduction of any new method or units are quartered. The lecturers are Royal Army Medical Corps officers selected by divisional and brigade commanders and attendance is voluntary. Non-commissioned officers and men have attended in good numbers. These courses will in future be held annually. A small manual on the prevention of disease in the army has been issued for use in connexion with these lectures. Courses of instruction in the practical methods of sanitation of lines, barracks, and cantonments have also been instituted for young medical officers. For this purpose all the lieutenants of the Royal Army Medical Corps and Indian Medical Service on first arrival in the country are posted for one month to Rawal Pindi, Poona, Lucknow, or Bangalore, according to the command to which they belong. The instructors are nominated by the principal medical officer of His Majesty's forces in India, and the courses are carried out under the immediate supervision of the senior medical officer in consultation with the command or divisional sanitary officer.

[14] Brit. Med. Jour., vol. ii., 1905, p. 1245.

Sanitary Supervision of Barracks.

Trial has been made in a few stations of training and employing a certain number of non-commissioned officers and men of each unit in the sanitary supervision of barracks, and regulations are about to be issued for this to be done in all British corps. Their duties will be carried out under the directions of the medical officer in charge of the lines and will consist in supervising within their lines water-supplies, the sale of food (except by regimental institutes), conservancy, disinfection, cleanliness, and sanitary policing generally. While so employed they will not be detailed for other duties. Classes of instruction will be held annually.

Bacteriological Laboratory at Muktesar.

The appointment of a physiological chemist for the bacteriological laboratory of the Indian Civil Department at Muktesar has been sanctioned. The officer will be selected at home.

Plague in the Punjab.

The report of the officiating Sanitary Commissioner in the Punjab for the year 1907 shows an average mortality from ordinary diseases combined with a mortality from plague which is without parallel in recent history. So numerous were the deaths from plague that the death-rate rose from nearly 37 per 1000 to slightly over 62, yet it is clear that apart from plague the registered death-rate was normal. These figures when analysed are found to present many remarkable points of interest. For instance, large towns suffered less than the small ones, and the plague mortality was highest in rural circles. There has been a decrease, from 51 per cent. in 1903 to 15 per cent. in 1907, in the preponderance, previously so remarkable, of deaths of females from plague; and while deaths from plague accounted for about half the deaths of persons of all ages they were responsible for only one-seventh of the infant mortality. To combat the plague Government took the usual measures, but the people are said not to have shown any willingness to avail themselves of inoculation or to practise evacuation on any considerable scale, though "they endured the epidemic with the splendid patience and fortitude which have characterised them in the past."

A Cheap Food.

The Government of Bombay is considering a suggestion by Commissioner Booth-Tucker to introduce tapioca as a cheap food. The Bhils of Khandesh have taken readily to the new food and are experimenting in growing it. The tuber is indifferent to heat (thriving best in open sunny situations) and will also withstand slight frost, so that broadly speaking it will exist anywhere in India up to an elevation of 4000 feet or so. It flourishes under a rainfall of 150 inches and at Poona it looks quite healthy with 25 inches. It is sown as a minor crop near their houses by the Nepalis and Lepchase in the Darjeeling district. It is also largely grown in Travancore and Malabar in the south. The average out-turn of the tubers per acre on the Manjri farm was 16,248 pounds. The percentage of starch to whole tubers varied from 16 to 25. These figures compare favourably with 13,440 pounds of tubers and 20 per cent. starch obtained in Jamaica. At Quilon and Alleppey, in Travancore, the chief centre of tapioca root trade, the root is sold in three different forms—viz.: (1) fresh whole tubers; (2) sliced and sun-dried tubers; and (3) sliced, boiled, and sun-dried tubers. In March last the following rates were obtaining at Alleppey: fresh whole tubers, 224 pounds per rupee; sliced and sun-dried tubers, 45 pounds per rupee; and sliced, boiled, and sun-dried tubers, 40 pounds per rupee. The large difference between the price of fresh tubers and that of sliced sun-dried tubers is mainly due to the former containing 66 per cent. of water.

August 6th.

Obituary.

THOMAS ORME DUDFIELD, M.D. ST. AND., M.R.C.S. ENG., L.R.C.P. LOND.,

MEDICAL OFFICER OF HEALTH OF THE ROYAL BOROUGH OF KENSINGTON.

Dr. Thomas Orme Dudfield, who died on July 30th, had for many years held a distinctly prominent position among sanitary administrators. During his long and busy professional life he was a careful observer of everything which concerned public health, and circumstances fortunately enabled him to turn his knowledge to practical account for the benefit of the community at large.

He was born on Jan. 23rd, 1833, his father being Mr. Samuel Dudfield, a veterinary surgeon in the city of Gloucester. His original intention was to follow in his father's footsteps, and after attending the usual course of instruction at a veterinary college in London in 1852–53 he settled in Cheltenham as a veterinary surgeon. In a few years, however, his plans were changed and he once more became a student in London, this time at St. George's Hospital, where his diligence and abilities gained for him various awards, including a prize of 20 guineas in each of the three sessions between 1858 and 1861. In 1860 he was anatomical prosector at the Royal College of Surgeons of England, receiving eventually from Mr. South, the President of the College, a letter of thanks for his satisfactory performance of the duties. In 1861 he graduated as M.D. at the University of St. Andrews and was admitted M.R.C.S. Eng. and L.R.C.P. Lond. In this year also he commenced practice in Kensington and obtained the appointment of visiting medical officer of the Poor-law infirmary of St. Margaret and St. John, Westminster, which at that time stood in Marloes-road, Kensington, but is now conducted on a different system in another part of London. Pauper nurses were in those days invariably employed in Poor-law institutions, but the unsuitability of the average pauper woman for such work was beginning to be recognised; Dr. Dudfield was an active supporter of the reformers who advocated the appointment of paid nurses exclusively and in a few years pauper nursing was a thing of the past. During his tenure of this appointment, which continued from 1861 to 1877, he was elected a member of the vestry of Kensington parish and served on the sanitary committee. In 1871 the vestry elected him as medical officer of health of the parish. His membership of the Association (afterwards the Incorporated Society) of Medical Officers of Health dated from 1871; in 1874 he was chosen one of the council; during the two sessions 1883–84 and 1884–85 he was President, his predecessor in the chair being the late Dr. J. W. Tripe, medical officer of health of Hackney. Reports of his two presidential addresses appeared in THE LANCET of Oct. 27th, 1883, and Nov. 1st, 1884; they were well-reasoned discourses dealing principally with the need of uniformity in the sanitary administration of London and were heartily approved by the members of the society. Dr. Dudfield was the representative of the society at the examinations of sanitary inspectors and was a vice-president at the time of his death. He was also a corresponding member of the Société d'Hygiène de France.

In connexion with his work as medical officer of health of an extensive area in the metropolis Dr. Dudfield wrote not only very detailed monthly and annual reports for 36 years but also many occasional reports and pamphlets. During the first 29 years that he was so engaged the London medical officers of health were officials of the local vestries—public bodies which were made sanitary authorities by the Metropolis Local Management Act of 1855, and continued to act as such until 1901, when their sanitary functions were taken over by the newly created borough councils. At the final meeting of the Kensington vestry, which was held on sufficient analgesia occurred in 3 cases and failure to puncture in 2 cases. I should like to refer in detail to a few of the more interesting of these cases.

CASE 9.—The patient was a man, aged 39 years, who had received a blow over the left kidney. He was admitted with swelling in the kidney region and very severe hæmaturia. He was suffering from an attack of bronchitis and was therefore unsuitable for a general anæsthetic. Puncture was done with the patient on the left side with the pelvis slightly elevated, between the second and third spines. There was a brisk flow of cerebro-spinal fluid and two drachms were withdrawn. One cubic centimetre of solution was injected. The patient was kept on the left side for five minutes, when analgesia was two inches above the costal margin. He was then turned on to the right side and the operation was begun. Twelve stones were removed from the kidney and the patient had no pain at all during the operation which lasted 40 minutes. He had slight discomfort once in the epigastrium when one of the uppermost stones was being dragged out. The patient chatted freely during the operation and was greatly pleased. Paralysis of the legs lasted one and a half hours. He was very well the next day. There was no headache or sickness at all.

CASE 12.—The patient was a man, aged 52 years, with intestinal obstruction with fæcal vomiting of three days' duration. He was very feeble. The pelvis was slightly elevated; puncture was done between the second and third spines. There was a slow flow and only a few drops were withdrawn. One cubic centimetre of solution was injected. In five minutes analgesia was above the umbilicus and incision was made below the umbilicus. There was obstruction due to a malignant tumour, so a Paul's tube was inserted. The operation lasted 30 minutes and the patient was quite comfortable all the time. The pulse was very feeble at the start but was rather better after the operation. At the end analgesia was to the ensiform. The patient was very well the next day and there was no headache or sickness.

CASE 15.—The patient was a woman, aged 45 years, with malignant disease of the stomach causing pyloric obstruction. She was very feeble. The pulse was so weak that a general anæsthetic was thought unsafe. The pelvis was elevated two inches; puncture was done in the second and third space. There was a slow flow; one drachm was removed and one cubic centimetre of the solution was injected. In seven minutes there was complete analgesia to the ensiform and the abdomen was opened by an incision above the umbilicus. Disease was so extensive that a gastro-enterostomy could not be done and the abdomen was closed. Throughout the operation, which lasted 20 minutes, the patient was quite comfortable, and so far as the analgesia was concerned a gastro-enterostomy could have been done. The pulse kept fairly good all through and she had neither sickness nor headache.

CASE 33.—The patient was a man, aged 67 years (the oldest case), with hydro-hæmatocele and diseased testis. He had marked arterio-sclerosis. Puncture was done in the third and fourth space in the recumbent position. There was no elevation of the pelvis. There was a good flow and two drachms were withdrawn; one cubic centimetre was injected. In eight minutes there was complete analgesia up to two inches above the pubes. The whole mass was removed along with the testicle and the patient felt no pain at all. He was very well afterwards. There was no headache, sickness, or shock.

CASE 35.—The patient was a man, aged 41 years, with acute ruptured appendix. He was very ill and the abdomen was very rigid. Puncture was done in the second and third space; there was a brisk flow and two drachms were withdrawn; one cubic centimetre was injected. In ten minutes there was analgesia to the costal margin and the operation was begun. It was striking in this case to feel the rigidity of the muscles pass off and the abdomen become soft. There was no pain or discomfort during the operation, which lasted 35 minutes. At the end there was analgesia to the nipples. The patient was very well the next day. There was no sickness or headache.

CASE 36.—The patient was a man, aged 40 years, with oblique fracture of the right tibia. Puncture was done in the third and fourth space on the right side; there was a slow flow, one drachm being withdrawn; one cubic centimetre of the solution was injected. There was no elevation of the pelvis and the shoulders were slightly raised. In five minutes the operation was begun and the patient was quite comfortable while his fracture was plated together. The operation lasted 50 minutes. He was very well the next day and there was no headache or sickness. There was analgesia to the umbilicus.

CASE 47.—The patient was a man, aged 65 years, for suprapubic prostatectomy. Puncture was done in the third and fourth space. There was no elevation of the pelvis. There was a brisk flow, two drachms being withdrawn; one cubic centimetre was injected. In nine minutes there was complete analgesia to the umbilicus and the operation was begun. There was no pain or discomfort at all, not even when the prostate, a rather adherent one, was being separated. The operation lasted 20 minutes and the patient was very well all through. He was very well the next day. There was no headache or sickness and no apparent shock.

Condition during operation.—If the stovaine has been properly given the patient has no pain at all during the operation and will chat away quite comfortably during the most painful procedures. In many cases tactile sensation remains and the patient can tell that he is being touched although he has no pain. There has been no anxiety from the analgesia during any of the operations. In only one case did the pulse become rather feeble. This was an appendectomy in a young man who was very nervous, and it so rapidly improved that I think it was due to his mental condition. There has never been any respiratory trouble and no cases of faintness have occurred. Occasionally nausea and even sickness occur at the commencement of or during the operation. This is most apt to occur when a high analgesia has been obtained and in abdominal cases. It is undoubtedly in some cases due to nervousness, but in others this will not explain it. Five of our cases have had some nausea and sickness during operation, but it has always passed off in from three to ten minutes and the operation has been proceeded with quite comfortably.

Abdominal cases.—Abdominal relaxation is perfect and no straining can take place as the abdominal muscles are paralysed. It is striking in an acute abdominal condition with marked rigidity to feel the muscles gradually relax and become soft as the stovaine begins to act. Cutting of the peritoneum causes no discomfort, but traction on the bowel or peritoneum sometimes gives rise to discomfort in the epigastric region and a feeling of nausea. This is more apt to occur if the analgesia has not extended far above the seat of operation and it was more marked in our early cases. Later I found that if the analgesia extended to the mid-sternum this feeling was rarely complained of. One of our early appendectomies had to get a little chloroform during the separation of some dense adhesions, as it caused him so much discomfort in the epigastrium. Acute abdominal cases do extremely well and none of them have had any nausea, sickness, or headache. Four cases of laparotomy above the umbilicus have been done, and in all the analgesia was quite complete, no pain being felt at all. One cannot, however, rely on quite such a long analgesia as lower down.

Hæmorrhoid and perineal cases.—Here the puncture is done in the sitting position and the effect of the heavy compound is well seen. Owing to its weight it runs down into the sacral curve and one only gets analgesia of the perineal region, the legs and abdomen remaining unaffected, although by the end of the operation there may be some analgesia and loss of power in the legs. The patient is quite unconscious of the dilatation of his sphincter and his pulse is not affected at all.

Hernias.—Here spinal analgesia is most satisfactory, the relaxation of the muscles is perfect, and no pain or discomfort is felt.

Operations on the extremities.—The analgesia is easily got here and is absolutely perfect, even tactile sensation being often absent.

Failures.—Out of the 50 cases there have been two failures to puncture and three failures to get sufficient analgesia after apparent injection.

Failures to puncture.—Case 20, a man, aged 62 years, already referred to, where the lumbar spines could not be felt at all; and Case 44, a woman, aged 25 years. After some trouble the needle appeared to pass in all right, but no cerebro-spinal fluid could be got. Puncture was tried in two different places with the same result.

Failures to produce analgesia after injection.—Case 6, a

FOREIGN UNIVERSITY INTELLIGENCE.—*Berlin*: Dr. Carl Helbing, Assistant in the Orthopædic Institute, has been granted the title of Professor.—*Bologna*: Dr. Odorico Viana has been recognised as *privat-docent* of Midwifery and Gynæcology.—*Breslau*: Dr. Hermann Coenen, who was for many years Assistant in the Berlin Surgical Clinic under the late Professor von Bergmann, has been recognised as *privat-docent* of Surgery.—*Budapest*: Dr. Wilhelm Manniger has been recognised as *privat-docent* of Surgical Diagnosis; Dr. Tibor Verebely as *privat-docent* of Infectious and Surgical Diseases; Dr. Heinrich Benedict as *privat-docent* of the Pathology and Therapeutics of Constitutional Diseases; Dr. Karl Borssky as *privat-docent* of Operative Surgery; Dr. Desider Raskai as *privat-docent* of the Clinical Diagnosis of Diseases of the Urinary and Sexual Organs; Dr. Emmanuel Wein as *privat-docent* of Surgery; and Dr. Franz Torday as *privat-docent* of Pædiatry, with special reference to the Pathology and Therapeutics of Infants at the Breast.—*Greifswald*: Dr. Joseph Forschbach has been recognised as *privat-docent* of Medicine.—*Heidelberg*: Dr. Otto Ranke has been recognised as *privat-docent* of Neurology and Psychiatry.—*Kharkoff*: Dr. J. G. Orkhanski, Extraordinary Professor of Neurology and Mental Diseases, has been promoted to an Ordinary Professorship.—*Leipsic*: Dr. Florus Lichtenstein has been recognised as *privat-docent* of Midwifery and Gynæcology.—*New York* (*Cornell University*): Dr. Andrew Hunter of Leeds has been appointed Assistant Professor of Physiology.—*Vienna*: Dr. Robert Dorr has been recognised as *privat-docent* of General and Experimental Pathology.

INDIAN HOSPITALS AND DISPENSARIES.—The triennial report on the civil hospitals and dispensaries of the Bombay Presidency for the years 1905–07, which has recently been issued, is devoted almost entirely to statistics but the information, so far as it goes, is of a satisfactory nature. The number of patients is steadily increasing but the mortality among them has decreased. Generally speaking, the equipment leaves much to be desired but as the Government has granted substantial sums for extension and maintenance there is a good prospect of improvement in this respect. To the layman, says a writer in the *Times of India*, one of the most interesting features in the report is the statement of cases of snake-bite treated by Sir Lauder Brunton's method. In 1906 there were 19 of these cases, of whom 15 recovered and 4 died. In 1907 there were 13 cases of whom 3 died. "Looking to the general result," says Colonel J. McCloghry, I.M.S., acting Surgeon-General with the Government of Bombay, "the treatment appears to be successful, but at this stage, with such a small number under observation, I am not in a position to express a definite opinion thereon, especially as the snakes were not secured for identification." According to the *Pioneer Mail* of August 7th the last triennial report on the working of the charitable dispensaries in Bengal amply proves that comprehensive reforms and far-reaching improvements have been effected between 1905 and 1907 in the chief medical institutions in Calcutta. In respect of buildings, furniture, surgical instruments, and other matters tending towards efficiency, such establishments as the Presidency General Hospital, the Medical College Hospital, and the Campbell Hospital have been completely re-equipped at a considerable cost, the generous contributors including H.R.H. the Prince of Wales, in addition to numerous local benefactors. With regard to the arrangements for nursing in Calcutta, there is still, it appears, much room for improvement, but as the matter is at present under the consideration of the Lieutenant-Governor there is reason to hope that it will soon be forthcoming. The average yearly number of indoor patients treated in the Calcutta hospitals during the triennium was 28,231, against 27,598 and 26,169, the averages of the two preceding periods of three years. Last year the collective income from all sources was Rs.18,40,103, or about £120,000. In consequence of the partition of Bengal 299 dispensaries were transferred to the new Province of Eastern Bengal with Assam. In the course of the triennium 41 new dispensaries were opened and five of the existing ones were closed. On the whole, the financial position of the dispensaries is said to be satisfactory. The fact that liberal contributions are in most cases received from local authorities testifies that an increasing interest in these establishments is taken by municipalities and district boards.

THE FOURTH INTERNATIONAL CONGRESS ON ELECTROLOGY AND RADIOLOGY.—We may again remind our readers that the Fourth International Congress on Electrology and Radiology will be held at Amsterdam from Sept. 1st to 5th, under the presidency of Dr. J. K. A. Wertheim Salomonson. The results of the three former congresses, at Paris in 1900, at Berlin in 1903, and at Milan in 1905, have proved their utility and importance, and the fourth congress will be organised on the same lines, the programme comprising all questions of electro-pathology, radiology, and electro-therapeutics. In conjunction with the congress an exhibition will be arranged of new or modified apparatus used in clinical and laboratory work, and also a collection of interesting radiographs. Communications with regard to the exhibition can be addressed to M. Vogelpoel and M. Noorweegen, O.Z. Voorburgwal 151, Amsterdam, who will act as agents. The congress and the exhibition will be held in the University, and the general secretaries and treasurers are Dr. J. G. Gohl and Dr. F. S. Meijers, who may be addressed at Vondelstraat 53, Amsterdam.

DONATIONS AND BEQUESTS.—The *Times* states that it is reported that Mr. Hugh Lewis, formerly of Tipton, has left the whole of his estate, valued at about £50,000, to the Guest Hospital, Dudley.—The late Mr. Openshaw, a native of Bury, has among other bequests, left the following sums for charitable purposes: £1000 to the Southport Infirmary, £250 to the National Society for the Prevention of Cruelty to Children, and £250 to the Manchester Royal Infirmary and Dispensary.—Dr. William Walter, who died at Rusholme Hall, Manchester, on March 17th, directed that, after the payment of a number of legacies and on the determination of various life interests in his property provided for in his will that property should be used for the endowment of a research scholarship for the study of the diseases of women and obstetrics at St. Mary's Hospital, in connexion with the University of Manchester. It is estimated that the bequest will amount to between £12,000 and £13,000.—Miss L. Tugwell, of Torquay, has bequeathed £500 to the Royal United Hospital, Bath.—The late Mr. C. W. Jones has bequeathed £1500 to the Carmarthen Infirmary and an additional £500 provided that the committee erects a children's ward at a cost of £750 and names it after the deceased.—The Chinese residents of Cardiff have given £20 to the funds of the Cardiff Infirmary.

MEDICAL MEN AND THE PUBLIC EYE.—The question of a medical man's fee came before the Hastings county court recently as a sequel to an operation performed upon a girl, aged 16 years, at Bexhill in June, 1907. The plaintiff was Mr. Robert Stuart Reid who had been called in as consultant and who performed the operation for which he charged 50 guineas.. The defendant was the father of the girl, Mr. John Greed, builder, and a member of the Bexhill town council, and he held that the amount was excessive and offered £25 in settlement. His honour Judge Scully, in giving his reserved judgment, said that the suggestion that the defendant's pecuniary position must be taken into consideration in fixing the fee was not a proper element to consider. The position that the plaintiff held in the public eye at Bexhill was as a general practitioner, and his honour said he could not hold that the plaintiff was entitled to remuneration as a specialist. He thought 30 guineas a reasonable and sufficient fee for the operation, and as 20 guineas had already been paid judgment was given for the plaintiff for 10 guineas and costs on that amount. His honour said that he appreciated that the operation was a difficult and a serious one and that the plaintiff exercised all proper and reasonable care in its performance. Evidence of witnesses, he added, showed that the girl's death was not in containing tubercle bacilli of human origin. None of them contracted the disease. 2. The same result was obtained with four animals which were caused to inhale the bacilli *in the form of spray. Injection* of bacilli into the peritoneal cavity or subcutaneously was no more successful. 3. Swine, asses, sheep, and goats were also unaffected. 4. In all cases where bacilli of bovine origin were substituted, the other conditions remaining the same, infection followed.[2] Koch then pointed out that experiments with human beings to determine their relative susceptibility were obviously impossible, but, in the opinion of the speaker, infection of the human subject was very uncommon; and he emphasised the last point on the ground that primary tuberculosis of the intestine is very rare, whereas it ought to be one of the commonest of diseases if the danger of infection through milk is real, owing to the quantity of milk consumed by children.

These opinions of Koch were contested at the Congress. They were contrary to the finding of two Royal Commissions which had been held in this country shortly before, and the general consensus of opinion was against Koch. Woodhead,[3] Cohnheim, Aufrecht, and Peterson,[4] all held that primary tuberculosis in man is comparatively common. This opinion was shared by the large majority of authorities in this country, and the evidence in favour of infection being due to tuberculous milk and meat was very strong.[5] Ravenel described striking cases in support of this view.[6] Hueppe quoted further cases to the same effect.[7] Crookshank combated the idea that human tuberculosis cannot be transmitted to bovines by describing successful inoculations carried out by himself and Sidney Martin.[8] It was, however, felt that opinions expressed so emphatically by an authority of Koch's eminence on a matter so nearly affecting the public health demanded the fullest investigation, and a Royal Commission was appointed to determine the questions at issue, whose findings were antagonistic to Koch's opinions, he having been misled, in the opinion of the Commission, by using only one strain of the bacillus and that not a very virulent one.

Koch, as I have said, in his speech in 1901 stated that experiments on the human subject to determine the effects of the bovine bacillus were out of the question, and this was obviously true when he made the statement, but in thinking over the whole matter it occurred to me that since that time the researches of Wright and Douglas on the opsonic effects of the blood fluids and their methods of estimating the opsonic index had placed in our hands an exact method, not only of experimenting with and ascertaining the resistance of human beings to the two strains of bacilli, but of extending the experiments to bovines and measuring their resistance also. It appears evident that a method of investigation which does not involve inoculation and feeding experiments or the infection and destruction of the animal will be advantageous on the ground of cheapness and expedition, and might be more certain and conclusive. If also it enables investigations to be carried on with the human subject with equal ease and certainty it will be still more valuable, a further advantage being the possibility of a very much larger series of observations. With this object in view I have carried out a series of illustrative experiments, with the results detailed in the succeeding part of this article.

The technique adopted was that of Wright and Douglas, with certain necessary modifications. Emulsions of human and bovine tubercle bacilli respectively were obtained from the Lister Institute, and every effort was made to get them as nearly as possible of the same strength, the origin of the two strains being guaranteed by the Institute. The same emulsions were used throughout all the observations, being stored in tubes, well shaken before use, and thoroughly centrifuged at the same time and in the same machine to get rid of clumps. Two volumes of white blood corpuscles, one of emulsion and one of serum, were used in all cases, and the time of incubation was a quarter of an hour. The strength of the emulsions had been so arranged as to give an average count of about one bacillus to each polymorphonuclear leucocyte. In the case of the bovine series the incubator was set to the normal temperature of the bovine—viz., 38·3° C. In all other cases the incubator of course worked at 37° C. The blood and leucocytes for the bovine series were obtained at the time of slaughter of the animal for food and in every case the carcass was afterwards inspected to make sure it was free from tuberculous infection. In every case the average of 100 counts was taken in arriving at the figures stated.

Bovine series.—This series comprises the result of observations taken with ten bovines of both sexes, but not differing very widely as to age, all being young adults of the age usually selected for slaughter—viz., from two to three years. The object of the observations was to ascertain whether the action of the opsonins in bovine blood was the same with regard to tubercle bacilli of both human and bovine strains, or whether there was any marked difference, which would indicate a distinction between the bacilli with regard to their susceptibility to the action of opsonins, and therefore a difference in the resistance of the animal to infection by bacilli of the different strains. The results are presented in the following table:—

TABLE I.—*Number of Bacilli of Human and Bovine Origin Respectively, taken up by Polymorphonuclear Leucocytes of Cattle (Average of 100 Counts).*

Number.	Human bacilli.	Bovine bacilli.
1	4·25	2·64
2	1·00	0·44
3	1·98	1·06
4	0·64	1·04
5	2·44	1·85
6	1·85	0·95
7	3·80	0·95
8	1·83	1·02
9	1·50	0·65
10	1·40	0·55
Total	20·69	11·15
Average of 1000 counts	2·069	1·115

This table indicates that there is a marked difference in the number of bacilli of the two different strains taken up by bovine polymorphonuclear leucocytes, and therefore also in the resistance of the animal to each. It will be seen that in every case save one (No. 4) the number of human bacilli ingested by the leucocytes is considerably greater than the number of bovine bacilli so absorbed. The phagocytes in some instances absorbed about three times as many of the one strain as they did of the other, and on the grand average of 1000 counts about 85 per cent. more human bacilli were absorbed than was the case with the bovine variety. This explains the comparative immunity of the bovine to infection of human origin observed by others, and may also explain Koch's failure to infect his animals, for an animal might easily be immune to a culture of mild human virus and subsequently succumb to a bovine culture owing to its inferior resistance to the latter variety. This comparative immunity is not, however, so great as to justify the conclusion that bovines are exceptionally resistant to infection of human origin, and indeed would easily break down under the invasion of human bacilli of high virulence, as was found to be the case by the Royal Commissioners.

Resistance of children.—A series of counts was then made to ascertain the resistance of children to the bacilli of the two different strains, and a result quite the converse of that in Table I. was obtained, the experiments all giving consistent readings.

It will be seen from Table II. that the counts were much greater with the bovine bacillus than those given with bacilli of human orgin. The average figures for these ten children and for 1000 counts in each series show a greater resistance to the bovine type by 254 per cent. as compared with the resistance to human bacilli. If these observations are correct, therefore, the average country child would be about two and a half times more likely to succumb to human infection than he would to infection through milk, assuming

Indian Hospitals and Dispensaries.—The triennial report on the civil hospitals and dispensaries of the Bombay Presidency for the years 1905-07, which has recently been issued, is devoted almost entirely to statistics but the information, so far as it goes, is of a satisfactory nature. The number of patients is steadily increasing but the mortality among them has decreased. Generally speaking, the equipment leaves much to be desired but as the Government has granted substantial sums for extension and maintenance there is a good prospect of improvement in this respect. To the layman, says a writer in the *Times of India*, one of the most interesting features in the report is the statement of cases of snake-bite treated by Sir Lauder Brunton's method. In 1906 there were 19 of these cases, of whom 15 recovered and 4 died. In 1907 there were 13 cases of whom 3 died. "Looking to the general result," says Colonel J. McCloghry, I.M.S., acting Surgeon-General with the Government of Bombay, "the treatment appears to be successful, but at this stage, with such a small number under observation, I am not in a position to express a definite opinion thereon, especially as the snakes were not secured for identification." According to the *Pioneer Mail* of August 7th the last triennial report on the working of the charitable dispensaries in Bengal amply proves that comprehensive reforms and far-reaching improvements have been effected between 1905 and 1907 in the chief medical institutions in Calcutta. In respect of buildings, furniture, surgical instruments, and other matters tending towards efficiency, such establishments as the Presidency General Hospital, the Medical College Hospital, and the Campbell Hospital have been completely re-equipped at a considerable cost, the generous contributors including H.R.H. the Prince of Wales, in addition to numerous local benefactors. With regard to the arrangements for nursing in Calcutta, there is still, it appears, much room for improvement, but as the matter is at present under the consideration of the Lieutenant-Governor there is reason to hope that it will soon be forthcoming. The average yearly number of indoor patients treated in the Calcutta hospitals during the triennium was 28,231, against 27,598 and 26,169, the averages of the two preceding periods of three years. Last year the collective income from all sources was Rs.18,40,103, or about £120,000. In consequence of the partition of Bengal 299 dispensaries were transferred to the new Province of Eastern Bengal with Assam. In the course of the triennium 41 new dispensaries were opened and five of the existing ones were closed. On the whole, the financial position of the dispensaries is said to be satisfactory. The fact that liberal contributions are in most cases received from local authorities testifies that an increasing interest in these establishments is taken by municipalities and district boards.

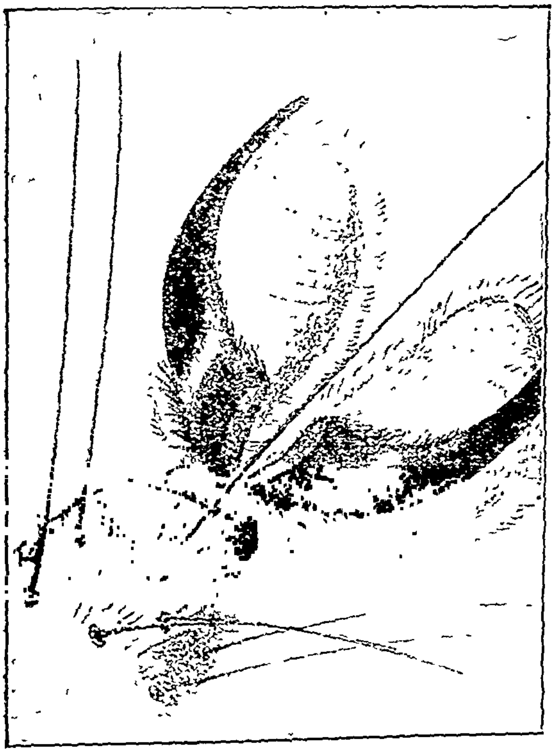
The Fourth International Congress on Electrology and Radiology.—We may again remind our readers that the Fourth International Congress on Electrology and Radiology will be held at Amsterdam from Sept. 1st to 5th, under the presidency of Dr. J. K. A. Wertheim Salomonson. The results of the three former congresses, at Paris in 1900, at Berlin in 1903, and at Milan in 1905, have proved their utility and importance, and the fourth congress will be organised on the same lines, the programme comprising all questions of electro-pathology, radiology, and electro-therapeutics. In conjunction with the congress an exhibition will be arranged of new or modified apparatus used in clinical and laboratory work, and also a collection of interesting radiographs. Communications with regard to the exhibition can be addressed to M. Vogelpoel and M. Noorweegen, O.Z. Voorburgwal 151, Amsterdam, who will act as agents. The congress and the exhibition will be held in the University, and the general secretaries and treasurers are Dr. J. G. Gohl and Dr. F. S. Meijers, who may be addressed at Vondelstraat 53, Amsterdam.

Donations and Bequests.—The *Times* states that it is reported that Mr. Hugh Lewis, formerly of Tipton, has left the whole of his estate, valued at about £50,000, to the Guest Hospital, Dudley.—The late Mr. Openshaw, a native of Bury, has among other bequests, left the following sums for charitable purposes: £1000 to the Southport Infirmary, £250 to the National Society for the Prevention of Cruelty to Children, and £250 to the Manchester Royal Infirmary and Dispensary.—Dr. William Walter, who died at Rusholme Hall, Manchester, on March 17th, directed that, after the payment of a number of legacies and on the determination of various life interests in his property provided for in his will that property should be used for the endowment of a research scholarship for the study of the diseases of women and obstetrics at St. Mary's Hospital, in connexion with the University of Manchester. It is estimated that the bequest will amount to between £12,000 and £13,000.—Miss L. Tugwell, of Torquay, has bequeathed £500 to the Royal United Hospital, Bath.—The late Mr. C. W. Jones has bequeathed £1500 to the Carmarthen Infirmary and an additional £500 provided that the committee erects a children's ward at a cost of £750 and names it after the deceased.—The Chinese residents of Cardiff have given £20 to the funds of the Cardiff Infirmary.

Medical Men and the Public Eye.—The question of a *medical man's* fee came before the Hastings county court recently as a sequel to an operation performed upon a girl, aged 16 years, at Bexhill in June, 1907. The plaintiff was Mr. Robert Stuart Reid who had been called in as consultant and who performed the operation for which he charged 50 guineas. The defendant was the father of the girl, Mr. John Greed, builder, and a member of the Bexhill town council, and he held that the amount was excessive and offered £25 in settlement. His honour Judge Scully, in giving his reserved judgment, said that the suggestion that the defendant's pecuniary position must be taken into consideration in fixing the fee was not a proper element to consider. The position that the plaintiff held in the public eye at Bexhill was as a general practitioner, and his honour said he could not hold that the plaintiff was entitled to remuneration as a specialist. He thought 30 guineas a reasonable and sufficient fee for the operation, and as 20 guineas had already been paid judgment was given for the plaintiff for 10 guineas and costs on that amount. His honour said that he appreciated that the operation was a difficult and a serious one and that the plaintiff exercised all proper and reasonable care in its performance. Evidence of witnesses, he added, showed that the girl's death was not in milk. In some cases I had a control tube of the milk which I had sterilised. I also caught house flies at random from non-infected houses and placed them in sterilised milk. The tubes were then handed over by me to Lieutenant Pierpoint. He made a number of cultures. The conclusion we came to was: "That the house fly is the carrier of swarms of micro-organisms, and overclouding all other varieties by their tremendous number are the staphylococci. To have isolated and made pure cultures of the different micro-organisms carried by the fly, to have made inoculation experiments with these when isolated, would, we felt, have entailed at the very least nine months of one man's sole time each day—in fact, it would have meant one person's daily work for two or three years." This was a sacrifice neither of us could afford to make and we abandoned bacteriological research into the subject at this point. In connexion with this I may allude to one point. At one time I tried to use some of the corporation sterilised milk but had to abandon it as we found staphylococci in the control tube. Whether the flies were taken from an infected or non-infected house they always carried multitudes of micro-organisms.

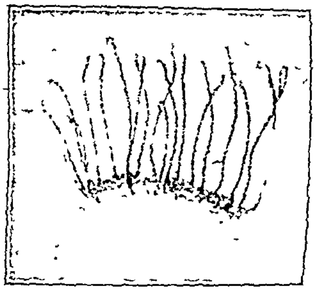
My next step was to investigate the anatomy of the house fly, its life-history, and habits. The best treatise upon it is by James Samuelson, "The Earth Worm and the Common House Fly," published by John Van Voorst, to which I am indebted for the following information. "It is an insect belonging to the order *diptera* (two-winged). The body of the fly is composed of three sections, viz.:—1. The head. 2. The thorax or chest which is subdivided into three parts, viz.: A—the prothorax which is the anterior part; B—the mesothorax or middle part; C—the metathorax or posterior part. 3. The abdomen which contains amongst other organs the reproductive organs. On the prothorax are borne the antennæ or feelers which are the tactile organs. On the prothorax is found the first pair of legs; on the mesothorax the wings and second pair of legs; and on the metathorax the last pair of legs."

FIG. 1.



The leg of the fly is divided into five distinct limbs. The upper four of these I will dismiss with the remarks that covering them are minute hair-like projections which the fly seems to use to brush its wings with, as any casual observer can see if they choose to watch a fly on the wall at any time. The most interesting portion of the leg of the fly is its final, that is, fifth or tarsal, joint. The tarsus or foot of the fly is subdivided into five joints, the final one being provided with an apparatus enabling the insect to walk upon what appears to us to be perfectly smooth surfaces and to proceed in a position opposed to the laws of gravity. This apparatus consists of two moveable claws (Fig. 1), which the fly can affix to any small eminence or depression it meets in its course; and also of a pair of membranous expansions called "pulvilli" or pads which, when magnified, appear like the broad termination of a parchment battledore. These pulvilli are furnished with innumerable hairs; at the termination of each of the numerous hairs covering the surface is a minute expansion *which is kept moist* by a fluid exuding from the extremity. The belief now prevails that whilst each single hairlet (Fig. 2) serves as a sucking disc the two pulvilli act as cushions to preserve the larger hooks from abrasion, like the soft cushions that protect the sole of a cat's foot and enable it to tread so lightly.

FIG. 2.



In the house fly the reproductive organs are asexual. The female is distinguished by having a small tube—viz., the ovipositor—placed at the end of its abdomen. This organ consists of three or four rings which the fly can protrude or retract at will and which she employs for the purpose of depositing her eggs. The female's internal organs consist of a pair of branching tubes in which the ova are developed, and the male has tubes and glands which furnish the spermatozoa-containing fluid. The sexual organs of both male and female are situated in the abdominal portion of the body. According to Keller, the female deposits her eggs six to eight days after impregnation; this she usually does in heaps of decaying substance such as her instinct denotes will most suitably nourish her larvæ—e.g., dunghills and the heaps of vegetable and other substances found in the neighbourhood of our houses. "If," says Keller, "the fly be enabled to choose the place which suits her best for the deposition of her eggs (as, for instance, in my sugar basin, in which I placed a quantity of decayed wheat) she takes a correct survey of every part and selects that in which she believes her ova will be best preserved, and her young ones well cared for. If there were too much moisture, the maggots would be drowned; if too little, the first drought would cause eggs and larvæ to become desiccated. Having chosen a suitable locality, one neither too wet nor too dry, she protrudes her little ovipositor and therewith lays her eggs, by the side of and upon one another. During the operation she sits perfectly still, remaining so for seven and a half minutes, and laying 70, 80, or 90 eggs."

Keller observed that the fly does not die after oviposition but believes, along with other naturalists, that she deposits her eggs three or four times during her life of a few weeks or months. He assumed that the fly deposits 80 ova at a sitting and does so four times in her life. Keller has drawn up a table showing that one fly in a single season may be the progenitrix of over 2,000,000 flies. This accounts for the tremendous number of flies met with in the summer, although a great number of her eggs are never hatched, being destroyed by drought, flood, or birds or animals preying on them, and a like fate meets many of the larvæ. Such is the portion of the anatomy and life-history of the fly, which bears upon summer diarrhœa.

I will now pass on to describe how the fly probably acts as the carrier of the infective agent of summer diarrhœa.

Harvey, Frank, M.R.C.S., L.S.A., has been appointed Medical Officer for the No. 1 District by the St. Columb (Cornwall) Board of Guardians.

Jackson, F. D. S., M.R.C.S., L.R.C.P. Lond., has been appointed Anæsthetist at the Evelina Hospital for Sick Children, Southwark, London, S.E.

Jones, David Rhys, L.F.P.S. Glasg., L.S.A., has been appointed Public Vaccinator for the Grangetown District of the Cardiff Union.

Jupp, E. A., M.R.C.S. Eng., L.R.C.P. Lond., has been appointed Certifying Surgeon under the Factory and Workshop Act for the Chard District of the county of Somerset.

Krumbholz, C. J. L., M.B. Lond., M.R.C.S. Eng., L.R.C.P. Lond., has been appointed Certifying Surgeon under the Factory and Workshop Act for the Rugby District of the county of Warwick.

Macdiarmid, John, M.B., Ch.B. Edin., has been appointed House Surgeon at the City and County of Perth Royal Infirmary.

Mitchell, John C., M.B., C.M. Edin., has been appointed Government Bacteriologist to the Transvaal.

Nuttall, T. E., M.D. Edin., has been appointed Certifying Surgeon under the Factory and Workshop Act for the Accrington District of the county of Lancaster.

Wormald, T. L., M.B., B.S. Durh., has been appointed Resident Medical Officer at the Workhouse Hospital, Newcastle-on-Tyne.

Wyndham, T. L., L.R.C.P. & S. Edin., L.F.P.S. Glasg., has been appointed Certifying Surgeon under the Factory and Workshop Act for the Oughtibridge District of the county of York.

Vacancies.

For further information regarding each vacancy reference should be made to the advertisement (see Index).

Bath Eye Infirmary.—Honorary Surgeon.

Bath, Royal Mineral Water Hospital.—Resident Medical Officer, unmarried. Salary £100 per annum, with lodging and board.

Bedford County Hospital.—House Physician. Salary £60 per annum, with apartments, board, and laundry.

Blackpool, County Borough of.—Medical Officer of Health. Salary £500 per annum, rising to £600.

Brighton, Hove, and Preston Dispensary.—House Surgeon. Salary £160, with rooms, coals, gas, and attendance.

Bristol Royal Infirmary.—Resident Casualty Officer for six months. Salary at rate of £50 per annum, with board, lodging, and washing.

Burnley County Borough.—Assistant Medical Officer of Health. Salary £200 per annum.

Bury Dispensary Hospital.—Junior House Surgeon. Salary £80 per annum, with board, residence, and attendance.

Cancer Hospital, Fulham-road, London, S.W.—House Surgeon. Salary £70 per annum, with board and residence.

Chartham, Kent County Asylum.—Third Assistant Medical Officer, unmarried. Salary £140 per annum, with board, quarters, attendance, and washing.

Cheshire, New Crossley Sanatorium, Delamere Forest.—Assistant Medical Officer. Salary £100 per annum, with board, apartments, and laundry.

City of London Lying-in Hospital, City-road, E.C.—Resident Medical Officer for four or six months. Salary at rate of £50 per annum, with board, lodging, and washing.

Dudley, The Guest Hospital.—Assistant House Surgeon. Salary £60 per annum, with residence, board, and washing.

East London Hospital for Children and Dispensary for Women, Shadwell, E.—Resident Medical Officer. Salary £100 per annum, with board, residence, and laundry. Also Medical Officer to the Casualty Department for six months, renewable. Salary at rate of £100 per annum, with luncheon and tea. Also Assistant Physician.

Exeter, Royal Devon and Exeter Hospital.—Assistant House Physician, unmarried. Salary £60 per annum, with board, lodging, and washing.

Gloucester General Infirmary and the Gloucestershire Eye Institution.—Assistant House Surgeon for six months. Salary at rate of £80 per annum, with board, residence, and washing.

Great Northern Central Hospital, Holloway.—Resident Medical Officer. Salary £120 per annum, with board, lodging, and washing. Also Senior House Surgeon, Senior House Physician, Junior House Physician, and Two Junior House Surgeons, in each case for six months. Salary of senior officers at rate of £45 per annum and of the junior officers £35 per annum, with board, lodging, and washing.

Grimsby and District Hospital.—House Surgeon. Salary £120 per annum.

Ipswich and East Suffolk Hospital.—House Surgeon for six months. Salary at rate of £65 per annum.

Jarrow Education Committee.—School Medical Officer. Salary £200 per annum, increasing to £250.

Kesteven Education Committee.—School Medical Officer. Salary £250 per annum and £100 for travelling expenses.

Leicester Infirmary.—Assistant House Surgeon; also Assistant House Physician, both for six months. Salaries at rate of £60 per annum, with board, lodging, and washing.

Leysin, Switzerland, English Sanatorium.—Assistant Medical Officer, unmarried. Salary at rate of £72 per annum for first six months, afterwards at £96, with board and lodging.

Liverpool Royal Infirmary.—Honorary Assistant Surgeon.

London Temperance Hospital, Hampstead-road, N.W.—Resident Medical Officer and Assistant Resident Medical Officer. Salary of former £120 per annum and of latter £52 10s. per annum, with board and residence. Also Non-resident Assistant House Surgeon for six months. Salary at rate of £75 per annum.

Mandalay Municipality.—Health Officer. Salary Rs.600 (£40) per mensem.

Metropolitan H[illegible] N.E.—Resident Anæsthetist. Salary at rate [illegible] per annum. Al[illegible] Physician, House Surgeon, As[illegible] House Surgeon, all for six months. Salary of two former at rate of £40 per annum, and of two latter at £20 per annum.

Mount Vernon Hospital for Consumption and Diseases of the Chest, Hampstead.—Junior Resident Medical Officer. Salary £50 per annum, with board and residence.

Newcastle-on-Tyne, Hospital for Sick Children.—Honorary Assistant Surgeon.

Norwich, Norfolk and Norwich Hospital.—Assistant House Surgeon for six months. Salary £20, with apartments, board, and laundry.

Nottingham City Asylum.—Second Assistant Medical Officer, unmarried. Salary £150 per annum, with board, apartments, and washing.

Oxford, Radcliffe Infirmary and County Hospital.—Junior House Surgeon, unmarried. Salary at rate of £40 per annum, with board, &c.

Plymouth, South Devon and East Cornwall Hospital.—House Physician for six months, renewable. Salary £75 per annum, with board, residence, and washing.

Royal London Ophthalmic Hospital, City-road, E.C.—Senior House Surgeon. Salary at rate of £100 per annum, with board and residence.

Royal Navy, Medical Department.—Fifteen Commissions.

Royal Waterloo Hospital for Children and Women, Waterloo-road, S.E.—Junior Resident Medical Officer. Salary at rate of £50 per annum, with board and washing. Also Senior Resident Medical Officer. Salary at rate of £70 per annum, with board and washing.

St. John's Wood and Portland Town Dispensary.—Third Medical Officer.

St. Peter's Hospital for Stone, &c., Henrietta-street, Covent Garden, W.C.—Junior House Surgeon for six months. Salary at rate of £50 per annum, with board, lodging, and washing.

Sheffield Royal Hospital.—Assistant House Physician, unmarried. Salary £50 per annum, with board, lodging, and washing.

Southampton Free Eye Hospital.—House Surgeon. Salary £100 per annum, with board and residence.

Southport Infirmary.—Resident Junior House and Visiting Surgeon, unmarried, for six months, renewable. Salary at rate of £70 per annum, with residence, board, and washing.

Southwark Infirmary, East Dulwich Grove, S.E.—Assistant Medical Officer. Salary £100 per annum, with board, lodging, and washing.

Stockport Education Committee.—School Medical Officer. Salary £250, increasing to £300 per annum.

Teignmouth Hospital, South Devon.—House Surgeon. Salary £70 per annum, with board, lodging, and washing.

Torosay, Parish of.—Medical Officer. Salary £100 per annum.

Worcester General Infirmary.—House Surgeon. Salary £100 per annum, with board, residence, and washing.

Wrexham Infirmary.—Resident Medical Officer. Salary £100 per annum, with board, lodging, and washing.

The Chief Inspector of Factories, Home Office, S.W., gives notice of a vacancy as Certifying Surgeon under the Factory and Workshop Act at Hatherleigh, in the county of Devon.

Births, Marriages, and Deaths.

BIRTHS.

Vaughan-Sawyer.—On Monday, August 31st, at 131, Harley-street, to Captain H. Vaughan-Sawyer, 23rd Sikh Pioneers, Indian Army, and Dr. *Ethel* Vaughan-Sawyer, M.D., B.S. Lond., a daughter.

Whitaker.—On August 30th, at The Cottage, Diss, Norfolk, the wife of Edgar Whitaker, M.R.C.S., L.R.C.P. Lond., of a son.

MARRIAGES.

Godson—Evans.—On August 26th, at Bowdon parish church, Francis Arthur Godson, M.B., B.C. Cantab., Pinehurst, Didsbury, to Alice Frances, elder daughter of Thomas Evans, Bowdon.

Turner—Schofield.—On August 27th, at St. George's Church, Morpeth, by the Rev. A. H. Drysdale, D.D., George Grey Turner, F.R.C.S. Eng., of Newcastle-upon-Tyne, to Alice Grey Schofield, B.Sc., second daughter of F. E. Schofield, of Morpeth.

DEATHS.

Foster.—On August 19th, at Fullarton House, Watton, Norfolk, Henry George Foster, L.R.C.S. Edin., L.S.A., late of Attleborough, Norfolk, aged 65 years.

Lightfoot.—On August 27th, at Hove, Robert Twentyman Lightfoot, L.R.C.S. Edin., L.S.A., late of Newcastle-on-Tyne, in his 94th year.

Swindell.—On August 29th, at Wynberg, Madeira-avenue, Worthing, John James Swindell, M.R.C.S.E., late of Fairfield, North Finchley, aged 62.

Welch.—On August 26th, Walter Barrows Welch, M.R.C.S., L.S.A., of Stanford-avenue, Brighton, aged 44 years.

N.B.—A fee of 5s. is charged for the insertion of Notices of Births, Marriages, and Deaths.

of double optic neuritis. If, therefore, these cases are due to thrombosis in the venous channels of the skull—and escape from this conclusion seems impossible—it follows that such thrombosis is an efficient cause of double optic neuritis. It is true that in some of the cases to which reference is now made optic neuritis has not been present. But these negative experiences cannot invalidate the definite and positive observations in which optic neuritis, existing together with other cerebral symptoms, has been found to have no pathological explanation other than intracranial thrombosis. The position finds an exact parallel in intracranial tumour. In some cases of tumour double optic neuritis is a prominent feature; in others the optic discs are normal. No one will use this latter fact as an argument to contest the proposition that intracranial tumour is competent as a cause of double optic neuritis. And the same conclusion must be applied to intracranial venous thrombosis. Among its possible effects, therefore, must be accepted the development of double optic neuritis.

It is hardly necessary to argue that another consequence may be a limited paralysis—say, for example, of one or other of the ocular muscles. If hemiplegia may be due to intracranial venous thrombosis—and this is beyond dispute—an ocular paralysis may well own a similar explanation, and, indeed, there are many cases in which this association has been clearly established. Therefore it may be affirmed, (1) that intracranial sinus and venous thromboses are the cause of the more or less severe cerebral attacks which occasionally complicate the course of chlorosis; and (2) that such thromboses may include among their consequences both double optic neuritis and ocular or other limited palsies.

With these propositions admitted, attention may be directed to the following summarised case-record.[1]

A girl, aged 17 years, manifestly the subject of chlorosis, came to hospital complaining of double vision. Examination showed that the diplopia was due to paralysis of the right external rectus muscle, and that each optic disc was swollen and its edges concealed by exudation; there was also some retinitis. There was no albuminuria and no evidences, other than the above, of organic disease were present. In the course of three months the patient had made a complete recovery.

Here, then, is a patient whose illness conforms strictly to the usual course of chlorosis, except for the fact that she has double optic neuritis and an ocular paralysis. These two events, if the argument already advanced is sound, may certainly be accounted for by intracranial thrombosis, to which, from her anæmic condition, the patient is undoubtedly liable. An alternative explanation is hard to suggest and in view of all these circumstances the diagnosis of intracranial thrombosis may reasonably be held to be probable or even inevitable. Take a second case-record.[2]

A patient, aged 22 years, was admitted to hospital on account of severe headache, breathlessness, double vision, and failing sight. She was found to be the subject of chlorosis, of marked double optic neuritis with retinitis, and of paralysis of the left external rectus muscle. In addition, the knee-jerk could not be obtained on either side. The patient ultimately made a complete recovery, though the return of the knee-jerks was delayed for many months.

Here, again, the argument in reference to the cause of the optic neuritis and ocular paralysis may be repeated. Thrombosis will explain these facts and it will also, presumably, explain the severe headache. Possibly the loss of the knee-jerks may not so readily accommodate itself to the diagnosis of intracranial thrombosis, but even here it may be remembered that certain intracranial tumours and also some forms of meningitis, cause a similar loss. Further, in some of the more serious cases of anæmic thrombosis, as proved by necropsy, distinct disturbance of the tendon jerks has been observed, though this has perhaps been rather in the direction of excess than defect. Altogether there seems abundant justification for the claim that the above case is a further example of double optic neuritis and an ocular paralysis occurring in a patient free from evidences of disease other than anæmia, and that these two symptoms must find in intracranial thrombosis their clinical and pathological explanation. Hence it would seem not only that double optic neuritis and an ocular paralysis may be numbered among the clinical events possibly attendant upon intracranial thrombosis, but also that they may appear as the only evidences of this condition. This conclusion brings such case-records as the two just quoted into a natural relationship with the more extreme examples of cerebral disturbance to which reference has already been made and in a certain number of which intracranial thrombosis has been demonstrated on necropsy. The difference between the two groups, it is suggested, is merely one of degree, and both groups own common cause in the shape of thrombosis affecting the cerebral veins and sinuses.

This position is further strengthened by the fact that experiences intermediate between the two extremes are by no means wanting. There are well-authenticated cases of anæmia in which the patients have been attacked more or less suddenly by severe headache, pains in the neck, and vomiting, together with optic neuritis and ocular paralysis. It is common to suggest that the intracranial condition responsible for these symptoms is a localised and transient meningitis, or an œdema of the brain, though positive evidence in support of either of these views is difficult to find. On the other hand, thrombosis will cover all the facts, and, if allowed, will permit the construction of a graded series of cases, occurring in anæmic patients, characterised by more or less severe evidences of cerebral disturbance, and finding in intracranial blood-clotting a common bond of interpretation. At one extreme are fatal cases with such symptoms as coma, delirium, various paralyses, and, sometimes, optic neuritis, and proved by necropsy to be dependent on intracranial thrombosis; next come examples of less severe but still considerable cerebral disturbances, including optic neuritis, and having a favourable termination, the diagnosis of intracranial thrombosis being confirmed by the occurrence of thrombosis in the jugular, femoral, or other veins; succeeding these may be placed cases of unusually violent headache and vomiting, with optic neuritis and an ocular paralysis; and after these fall those cases of anæmia in which optic neuritis and an ocular paralysis are the sole unusual events. The earlier members of this series are demonstrably dependent on thrombosis, whilst, as has already been argued, the cases in the last group readily adapt themselves to the same explanation. To detach the intermediate members of the series from the diagnosis of thrombosis is surely a somewhat arbitrary and unnatural proceeding, more especially when the alternative explanation suggested cannot possibly be more than a mere surmise. Hence the claim may be pressed, that in all the groups above presented as examples of more or less severe cerebral disturbances complicating anæmia there is one and the same underlying pathological condition—namely, thrombus formation in the intracranial veins or sinuses.

The question now arises whether the series of cases to be explained in this fashion can be carried a stage further. If optic neuritis and an ocular paralysis appearing together in a case of anæmia are to be attributed to intracranial thrombosis, is it not probable that when, under similar conditions, either exists alone, thrombosis is again the responsible cause? Thrombosis is competent to cause each of these events; it is also a recognised complication of the anæmic state; further, it may be questioned whether any more satisfactory, or indeed any equally satisfactory, explanation can be advanced. Hence thrombosis has a fair claim for recognition as the cause both of optic neuritis and of ocular paralysis when one or other of these symptoms appears as the sole unusual departure from the ordinary clinical course of simple anæmia. Ocular paralysis, it may be admitted, is only very occasionally in this position. Double optic neuritis, on the other hand, is a well-recognised complication of anæmia and its occurrence has given rise to a good deal of speculation. Here it is presented—and the same may be said of an ocular paralysis—as the simplest clinical expression of an intracranial thrombosis, and the claim is made that an examination of the series of cases in which cerebral events complicate anæmia affords a presumptive proof of the correctness and adequacy of this proposition.

An attempt may now be made to find support for the argument that optic neuritis in anæmia is probably due to intracranial thrombosis by an examination of certain other conditions in which, without any very obvious explanation, optic neuritis occasionally appears. One of these is the acute anæmia following a free hæmorrhage, as from the stomach, intestine, or uterus. Standing alone, such cases have a very

---

Medical Diary for the ensuing Week.

LECTURES, ADDRESSES, DEMONSTRATIONS, &c.

POST-GRADUATE COLLEGE, West London Hospital, Hammersmith-road, W.

MONDAY.—2 P.M., Medical and Surgical Clinics. X Rays. Mr. Dunn: Diseases of the Eyes. 2.30 P.M., Operations. 5 P.M., Lecture:—Dr. Saunders: The Medical Examination of School Children.

TUESDAY.—10 A.M., Dr. Moullin: Gynæcological Operations. 2 P.M., Medical and Surgical Clinics. X Rays. Dr. Davis: Diseases of the Throat, Nose, and Ear. 2.30 P.M., Operations. Dr. Abraham: Diseases of the Skin. 5 P.M., Lecture: Dr. Davis: The Medical Examination of School Children: Throat, Nose, and Ear Affections.

WEDNESDAY.—10 A.M., Dr. Saunders: Diseases of Children. Dr. Davis: Diseases of the Throat, Nose, and Ear. 2 P.M., Medical and Surgical Clinics. X Rays. Dr. K. Scott: Diseases of the Eyes. 2.30 P.M., Operations. Dr. Robinson: Diseases of Women. 5 P.M., Lecture:—Mr. L. Williams: The Dental Examination of School Children.

THURSDAY.—2 P.M., Medical and Surgical Clinics. X Rays. Mr. Dunn: Diseases of the Eyes. 2.30 P.M., Operations. 5 P.M., Lecture:—Dr. Saunders: The Medical Examination of School Children.

FRIDAY.—10 A.M., Dr. Moullin: Gynæcological Operations. 2 P.M., Medical and Surgical Clinics. X Rays. Dr. Davis: Diseases of the Throat, Nose, and Ear. 2.30 P.M., Operations. Dr. Abraham: Diseases of the Skin. 5 P.M., Lecture:—Dr. Abraham: Skin Diseases in School Children.

SATURDAY.—10 A.M., Dr. Saunders: Diseases of Children. Dr. Davis: Diseases of the Throat, Nose, and Ear. 2 P.M., Medical and Surgical Clinics. X Rays. Dr. K. Scott: Diseases of the Eyes. 2.30 P.M., Operations. Dr. Robinson: Diseases of Women.

OPERATIONS.

METROPOLITAN HOSPITALS.

MONDAY (7th).—London (2 P.M.), St. Bartholomew's (1.30 P.M.), St. Thomas's (3.30 P.M.), St. George's (2 P.M.), St. Mary's (2.30 P.M.), Middlesex (1.30 P.M.), Westminster (2 P.M.), Chelsea (2 P.M.), Samaritan (Gynæcological, by Physicians, 2 P.M.), Soho-square (2 P.M.), City Orthopædic (4 P.M.), Gt. Northern Central (2.30 P.M.), West London (2.30 P.M.), London Throat (9.30 A.M.), Royal Free (2 P.M.), Guy's (1.30 P.M.), Children, Gt. Ormond-street (9 A.M.), St. Mark's (2.30 P.M.).

TUESDAY (8th).—London (2 P.M.), St Bartholomew's (1.30 P.M.), St. Thomas's (3.30 P.M.), Guy's (1.30 P.M.), Middlesex (1.30 P.M.), Westminster (2 P.M.), West London (2.30 P.M.), University College (2 P.M.), St. George's (1 P.M.), St. Mary's (1 P.M.), St. Mark's (2.30 P.M.), Cancer (2 P.M.), Metropolitan (2.30 P.M.), London Throat (9.30 A.M.), Samaritan (9.30 A.M. and 2.30 P.M.), Throat, Golden-square (9.30 A.M.), Soho-square (2 P.M.), Chelsea (2 P.M.), Central London Throat and Ear (2 P.M.), Children, Gt. Ormond-street (9 A.M. and 2 P.M.), Ophthalmic (2 P.M.), Tottenham (2.30 P.M.).

WEDNESDAY (9th).—St. Bartholomew's (1.30 P.M.), University College (2 P.M.), Royal Free (2 P.M.), Middlesex (1.30 P.M.), Charing Cross (3 P.M.), St. Thomas's (2 P.M.), London (2 P.M.), King's College (2 P.M.), St. George's (Ophthalmic, 1 P.M.), St. Mary's (2 P.M.), National Orthopædic (10 A.M.), St. Peter's (2 P.M.), Samaritan (9.30 A.M. and 2.30 P.M.), Gt. Northern Central (2.30 P.M.), Westminster (2 P.M.), Metropolitan (2.30 P.M.), London Throat (9.30 A.M.), Cancer (2 P.M.), Throat, Golden-square (9.30 A.M.), Guy's (1.30 P.M.), Royal Ear (2 P.M.), Royal Orthopædic (3 P.M.), Children, Gt. Ormond-street (9 A.M. and 9.30 A.M., Dental, 2 P.M.), Tottenham (Ophthalmic, 2.30 P.M.), West London (2.30 P.M.).

THURSDAY (10th).—St. Bartholomew's (1.30 P.M.), St. Thomas's (3.30 P.M.), University College (2 P.M.), Charing Cross (3 P.M.), St. George's (1 P.M.), London (2 P.M.), King's College (2 P.M.), Middlesex (1.30 P.M.), St. Mary's (2.30 P.M.), Soho-square (2 P.M.), North-West London (2 P.M.), Gt. Northern Central (Gynæcological, 2.30 P.M.), Metropolitan (2.30 P.M.), London Throat (9.30 A.M.), *Samaritan* (9.30 A.M. and 2.30 P.M.), Throat, Golden-square (9.30 A.M.), Guy's (1.30 P.M.), Royal Orthopædic (9 A.M.), Royal Ear (2 P.M.), Children, Gt. Ormond-street (9 A.M. and 2 P.M.), Tottenham (Gynæcological, 2.30 P.M.), West London (2.30 P.M.).

FRIDAY (11th).—London (2 P.M.), St. Bartholomew's (1.30 P.M.), St. Thomas's (3.30 P.M.), Guy's (1.30 P.M.), Middlesex (1.30 P.M.). *Charing* Cross (3 P.M.), St. George's [illegible] (2 P.M.), Ophthalmic (10 A. [illegible] Northern Central (2.30 P.M.), West London (2.30 P.M.), London Throat (9.30 A.M.), Samaritan (9.30 A.M. and 2.30 P.M.), Throat, Golden-square (9.30 A.M.), City Orthopædic (2.30 P.M.), Soho-square (2 P.M.), Central London Throat and Ear (2 P.M.), *Children*, Gt. Ormond-street (9 A.M., Aural, 2 P.M.), Tottenham (2.30 P.M.), St. Peter's (2 P.M.).

SATURDAY (12th).—Royal Free (9 A.M.), London (2 P.M.), Middlesex (1.30 P.M.), St. Thomas's (2 P.M.), University College (9.15 A.M.), Charing Cross (2 P.M.), St. George's (1 P.M.), St. Mary's (10 A.M.), Throat, Golden-square (9.30 A.M.), Guy's (1.30 P.M.), Children, Gt. Ormond-street (9 A.M. and 9.30 A.M.), West London (2.30 P.M.).

At the Royal Eye Hospital (2 P.M.), the Royal London Ophthalmic (10 A.M.), the Royal Westminster Ophthalmic (1.30 P.M.), and the Central London Ophthalmic Hospitals operations are performed daily.

EDITORIAL NOTICES.

IT is most important that communications relating to the Editorial business of THE LANCET should be addressed *exclusively* "TO THE EDITOR," and not in any case to any gentleman who may be supposed to be connected with the Editorial staff. It is urgently necessary that attention should be given to this notice.

It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this office.

Lectures, original articles, and reports should be written on one side of the paper only, AND WHEN ACCOMPANIED BY BLOCKS IT IS REQUESTED THAT THE NAME OF THE AUTHOR, AND IF POSSIBLE OF THE ARTICLE, SHOULD BE WRITTEN ON THE BLOCKS TO FACILITATE IDENTIFICATION.

Letters, whether intended for insertion or for private information, must be authenticated by the names and addresses of their writers—not necessarily for publication.

We cannot prescribe or recommend practitioners.

Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor."

Letters relating to the publication, sale and advertising departments of THE LANCET *should be addressed "To the Manager."*

We cannot undertake to return MSS. not used.

MANAGER'S NOTICES.

TO SUBSCRIBERS.

WILL Subscribers please note that only those subscriptions which are sent direct to the Proprietors of THE LANCET at their Offices, 423, Strand, London, W.C., are dealt with by them? Subscriptions paid to London or to local newsagents (with none of whom have the Proprietors any connexion whatever) do not reach THE LANCET Offices, and consequently inquiries concerning missing copies, &c., should be sent to the Agent to whom the subscription is paid, and *not* to THE LANCET Offices.

Subscribers, by sending their subscriptions direct to THE LANCET Offices, will insure regularity in the despatch of their Journals and an earlier delivery than the majority of Agents are able to effect.

THE COLONIAL AND FOREIGN EDITION (printed on thin paper) is published in time to catch the weekly Friday mails to all parts of the world.

The rates of subscriptions, post free, either from THE LANCET Offices or from Agents, are:—

FOR THE UNITED KINGDOM.		TO THE COLONIES AND ABROAD.	
One Year	£1 12 6	One Year	£1 14 8
Six Months	0 16 3	Six Months	0 17 4
Three Months	0 8 2	Three Months	0 8 8

Subscriptions (which may commence at any time) are payable in advance. Cheques and Post Office Orders (crossed "London and Westminster Bank, Westminster Branch") should be made payable to the Manager, Mr. CHARLES GOOD, THE LANCET Offices, 423, Strand, London, W.C.

TO COLONIAL AND FOREIGN SUBSCRIBERS.

SUBSCRIBERS ABROAD ARE PARTICULARLY REQUESTED TO NOTE THE RATES OF SUBSCRIPTIONS GIVEN ABOVE. It has come to the knowledge of the Manager that in some cases higher rates are being charged, on the plea that the heavy weight of THE LANCET necessitates additional postage above the ordinary rate allowed for in the terms of subscriptions. Any demand for increased rates, on this or on any other ground, should be resisted. The Proprietors of *THE LANCET* have for many years paid, and continue to pay, the whole of the heavy cost of postage on overweight foreign issues; and Agents are authorised to collect, and generally do so collect, from the Proprietors the cost of such extra postage.

The Manager will be pleased to forward copies direct from the Offices to places abroad at the above rates, whatever be the weight of any of the copies so supplied. Address—THE MANAGER, THE LANCET OFFICES, 423, STRAND, LONDON, ENGLAND.

thrombotic process, that severe and general symptoms display themselves. Hence there is no difficulty in imagining in a case of anæmia a sinus thrombosis sufficient to cause such a limited clinical expression as optic neuritis and yet failing, in consequence of non-extension of clot formation to the cerebral veins, to excite any general exhibition of cerebral disturbance. Such a suggestion, it may be held, provides a possible explanation of optic neuritis appearing as an isolated event in anæmia, and also meets the objection that, were the cause of such neuritis thrombus formation within the skull, there must needs be clinical evidence of this on a more or less extensive scale. In any event, whether the proposals here advanced on the theoretical aspects of optic neuritis and ocular paralysis occurring as clinical facts in cases of anæmia are, or are not, warranted, it is beyond question that intracranial thromboses may and do occur in anæmia, and that among their clinical evidences optic neuritis and ocular paralyses are most unquestionably to be numbered.

Again, it has been urged that if thrombosis of the veins and sinuses within the skull can cause optic neuritis the same result ought to follow blocking, as by thrombosis or embolism, of the cerebral arteries, and this admittedly (unless the clot be septic) is not the case. With all deference, the relevance of this argument may be contested. The circulatory and other changes which follow obstruction of an artery are not identical with those produced by obstruction of a vein, and in view of the admitted obscurity of the relations between optic neuritis on the one hand and intracranial lesions on the other, it is hardly safe to conclude that because arterial thrombosis does not cause optic neuritis venous thrombosis must necessarily fail to do so. Against such a conclusion, further, may be set the facts of experience, which compel the conviction that between venous thrombosis and arterial thrombosis there is, so far as optic neuritis is concerned, some essential difference. The one, whatever be the explanation, is, or may be, in the clinical order of events associated with optic neuritis, and the other has no such association. In view of such facts it seems idle to argue that because arterial obstruction does not cause optic neuritis venous obstruction must necessarily be incompetent in this respect. The facts show the contrary. *Hippocrate dira ce qu'il lui plaira; mais le cocher est mort.*

Once more, it has been said that whereas the optic neuritis of anæmia commonly subsides as the anæmia disappears under the administration of iron, this fact shows that the neuritis is due to some depreciation in the quality of the blood; were the neuritis due to thrombosis the therapeutic use of iron could not have any effect on it. The answer to this is that the optic neuritis of anæmia by no means always disappears promptly, and that its movement is far from keeping strict time with the improvement in the blood quality. On the contrary, it may persist for weeks or sometimes even for months after all the ordinary evidences of anæmia have completely disappeared. Further, it must be accepted that optic neuritis—and the same is true of the evidences of thrombosis generally—is not confined to cases in which the degree of anæmia is extreme. It may, indeed, exist with but moderate evidences of anæmia, and is frequently absent in the more severe cases—facts difficult to reconcile with the view that it is due directly to some blood defect. On the other hand, the suggestion of thrombus formation and persistence is readily consistent with an optic neuritis which endures in spite of a cure of the anæmia; while ultimate disappearance of the neuritis may reasonably be attributed to removal of the thrombus by those natural processes under the operation of which the channel of a thrombosed vessel may be completely restored.

Thus, to summarise the objections, it may be said that neither a difficulty in providing a manifest explanation of the mechanism by which sinus thrombosis may produce optic neuritis; nor the claim that the frequent absence of general cerebral disturbance with such neuritis opposes the diagnosis of intracranial thrombosis; nor the observation that in arterial thrombosis optic neuritis does not occur; nor the comment that the neuritis disappears under treatment by iron—is found, on examination, to present any insuperable objection to the proposition that optic neuritis occurring in anæmia has, in all probability, its explanation in the formation of blood clot in the veins or sinuses of the brain.

Attention may now be directed to certain other hypotheses which have been advanced to explain the occasional existence of optic neuritis in anæmia. One of these suggests that the cases are really examples of poisoning either by lead or syphilis and that to one or other of these agents both the anæmia and the neuritis must be attributed. It may be said at once that there is little, if any, positive evidence to support this statement. The recorded cases do not exhibit any of the usual symptoms of plumbism or syphilis, and the cure is effected not by remedies appropriate to these diseases but by the direct treatment of the anæmia. It may also be remarked that optic neuritis, as this occurs in anæmia, is frequently marked by very considerable swelling of the optic discs, and is on this account much more suggestive of some definite intracranial lesion than of a toxic condition of the blood, in which, when it produces optic neuritis, the swelling of the disc is a comparatively insignificant fact. Indeed, the ophthalmoscopic picture in the optic neuritis of anæmia often exactly agrees with the facts common in intracranial tumour, and unless this is remembered a serious error in diagnosis may be made, especially if, as is not uncommon in anæmic women, the patient also suffers from more or less severe headache and from occasional attacks of vomiting (Gowers).

According to a second theory, the optic neuritis of anæmia depends on œdema of the brain. This, however, is little more than an empty phrase. The only evidence in support of such a view is, perhaps, to be found in some few cases in which the existence of optic neuritis in association with amenorrhœa has been recorded, the necropsy revealing an excess of fluid in the cerebral ventricles. Such a pathological condition can, however, hardly have been a primary one, and in the absence of any definite statement in reference to thrombosis it seems not unlikely that the cases were really cases of anæmia, and that the essential intracranial change was clot formation in the cerebral veins and sinuses—a condition which, unless special search is made for it, may be readily overlooked even on post-mortem examination.

Demanding more respect than either of the foregoing suggestions is the view advanced by Sir William Gowers—namely, that optic neuritis in chlorosis depends partly on continued congestion of the optic discs due to hypermetropia, and partly on a toxic or other abnormal quality of the blood. On this, with great deference, it may be remarked that hypermetropia is not present in all cases of chlorotic optic neuritis, and that in any event it is difficult to believe that eye-strain, even when acting in coöperation with some deleterious agent present in the blood, can explain the extreme degree of swelling of the optic discs which has repeatedly attracted attention in the cases now under consideration. Further, neither eye-strain nor toxæmia will readily account for a unilateral ocular paralysis which, as has already been shown, occasionally accompanies the optic neuritis of anæmic women. Hence, in such a case it is necessary, on the view now under discussion, either to invoke two separate and distinct causes—one for the optic neuritis and a second for the ocular paralysis—or to argue that optic neuritis accompanied by an ocular paralysis in a case of chlorosis owns a different cause from the one which is in operation when, in similar conditions, optic neuritis appears apart from such paralysis. It may be fairly said that neither of these alternatives offers an inviting choice. On the other hand, thrombosis, which, in the circumstances, must be admitted as at least a possibility, is adequate to explain all the facts—both the optic neuritis and ocular paralysis existing in association and the optic neuritis present as an isolated event. In short, any theory other than intracranial thrombosis interposes a gap between cases of chlorosis accompanied merely by optic neuritis, and cases of the same disease in which there exist, together with optic neuritis, various other evidences of cerebral disturbance, whilst thrombosis brings all these cases into a common category and, while recognising a wide variety in the extent and severity of the clinical manifestations, includes all alike in an identical order.

Turning now from optic neuritis and ocular paralyses as occasional events in the clinical history of simple anæmia, attention may next be directed to certain disturbances of the visual fields which may exceptionally appear as complications in this disease. Probably these are very rare and it is to the courtesy of my hospital colleagues that I am indebted for the opportunity of studying the two instances which have come under my observation.

The first[3] was that of a woman, aged 34 years, in whom

[3] Mr. W. Ilbert Hancock's case, reported in detail in Practitioner, December, 1904.

A Clinical Lecture

ON

CERTAIN ANEURYSMS OF CEREBRAL VESSELS.

Delivered at University College Hospital, London, on May 12th, 1908,

BY JOHN ROSE BRADFORD, M.D. LOND., F.R.S.,

PHYSICIAN TO THE HOSPITAL.

GENTLEMEN,—There has recently been in the hospital what I venture to think is rather a typical case of aneurysm of a vessel of the brain, so I thought it would be a good opportunity to draw your attention to the clinical picture which is presented at any rate by some of these cases. In the first place, these conditions are not very rare. I cannot give you a statistical statement with reference to their incidence but will merely say that the specimens on the table show you that they are not very rare. and five of these cases are those which have come under my own observation in a not very large number of years. There are eight specimens here and there are many more in the museum, which I have not brought over because they do not exemplify any particular point. Quite a number of instances occur in private practice, so really the condition is not one simply of interest from the point of view of a rare and obscure diagnosis, though, after all, perhaps that is the main interest of the condition, because it is not one which admits of any satisfactory treatment, neither is it one in which you can modify the course of the illness to any marked degree. So one must confess that the main interest of the condition lies in its accurate diagnosis.

The frequency of aneurysm of the cerebral vessels is considerable, when you contrast aneurysms affecting vessels of similar size in other parts of the body. If you think for a moment, you will realise that one sees many cases of thoracic aneurysm; one sees a few cases of aneurysm of the big vessels of the limbs; but if you put those two kinds aside, you rarely see any other aneurysms. It is a rarity to see an aneurysm of a vessel of such size as the radial, for example, except in the case of cerebral vessels. So there is a very undue incidence of aneurysm involving the cerebral vessels, and I ought to say at once that I am only using the word aneurysm in the sense of gross tangible *aneurysm* and not in the sense of miliary aneurysms which. of course, lie at the root of what is called cerebral hæmorrhage. I use the term "cerebral aneurysm" simply to describe an aneurysm which is gross and obvious to the naked eye and does not require any special methods of demonstration to show it. There is therefore in the case of the cerebral vessels an undue frequency of aneurysms of this kind involving relatively small-sized vessels. It is a very interesting problem the solution of which, so far as I know, is not at present known; that is to say, why these aneurysms are so relatively common in the case of cerebral vessels. The cerebral vessels are peculiar anatomically, of course, in the thinness of their coats owing to the absence of any considerable amount of fibrous tissue. *They are peculiar* in their mode of support; they run in very large lymph channels. They are also peculiar—which is perhaps a more important point than the anatomical consideration—in their physiological relationships. That is a thing which has been but little studied with reference to high *tension* and also with reference to the incidence of aneurysm. If you take the vessels which have been studied mostly by physiologists—namely, the vessels of the abdominal area, which are noted for their muscularity and for their innervation—you will find that aneurysm is rare in that situation; that is to say, in any medium-sized vessels, any form of aneurysm except of the abdominal aorta or of the great branches as they spring from it, or of the renal vessels, is extremely rare, though not unknown. One of the patients, for example, from whom one of these specimens was obtained had an aneurysm also of one of the branches of the superior mesenteric artery. But such a thing is, as I have already told you, exceedingly rare, and one cannot help thinking sometimes that the incidence of aneurysm of the cerebral vessels must be linked to the differences in the physiology of the cerebral circulation as compared with such a circulation as that of the viscera. You see, the cerebral arteries are engorged passively whenever the tension rises in the systemic vessels. You cannot, by physiological methods, produce to a certainty any active constriction of the cerebral vessels if you produce at the same time a general constriction. Any nerve stimulation which leads to heightened tension and to constriction of the vessels of the abdominal area leads to dilatation of the cerebral vessels; they are passively distended as the result of the increased aortic pressure which is transmitted to them through the column of blood. And although nerves have been described by histologists as being present on the vessels of the brain and in the pia mater, still nobody has yet succeeded in obtaining unequivocal evidence of active vaso-motor control over the cerebral circulation.

It is rather a curious thing that aneurysms are relatively rare in those vessels where there is this active nervous influence, and that they are common in the big vessels, where of course vaso-motor mechanism has very little play, and they are common in the cerebral vessels. I think there is a good deal which might be done from the point of view of atheroma, and also perhaps from the point of view of aneurysm, with regard to the relation of the distribution of the disease to the nerve-supply. Another striking instance of the same sort of fact is sometimes seen in cases of widespread arterial sclerosis, where the vessels in the body generally are little more than calcified tubes. Such a description is no exaggeration and yet the vessels of the brain may be like those of an infant, perfectly normal and soft. One has seen that often in old people who have been the subjects of widespread calcification. It is very difficult to think that differences in distribution like that can be dependent simply on mechanical causes. The cerebral circulation at any rate is peculiar; the cerebral vessels are peculiar anatomically and physiologically, and one cannot help sometimes correlating that with the relative frequency of incidence of aneurysmal disease.

To pass on to the subject matter of the lecture, the vessels at the base of the brain most commonly affected by aneurysm are, first and foremost, the middle cerebral; secondly, the basilar (I am mentioning them in the order of the frequency of their involvement); thirdly, the internal carotid; and fourthly, the anterior cerebral. The other vessels, the anterior communicating, the posterior communicating, the posterior cerebral, and the superior cerebellar, are so infrequently affected that their involvement is not a matter of much practical clinical moment. The middle cerebral heads the list but the basilar runs it very close; there is not a difference of more than 4 or 5 per cent., I think, in the incidence of the disease in the two vessels, but in the most extensive statistics which have been collected the middle cerebral heads the list. The aneurysms are somewhat peculiar in the fact that they are very commonly saccular. They are very rarely false aneurysms or interstitial aneurysms or dissecting aneurysms; sometimes they are *fusiform*; interstitial aneurysms or dissecting aneurysms are almost unknown. Another striking feature, which is very well illustrated in this case, is that they have extraordinarily *thin walls*. The wall of this aneurysm, for example, is so thin that it might, unless it had been carefully dissected, have been mistaken for pia mater. Another peculiarity is that when you consider their size they are very prone to be full of blood clot. This specimen exemplifies that; it is full of laminated clot, and you will see the same thing in some of the other specimens, too, and in one the aneurysm has not ruptured and the swelling is absolutely solid. They are, however, especially remarkable for the thinness of their walls, and perhaps this again can be correlated with the absence of any marked amount of fibrous tissue in the cerebral vessels compared with some vessels in which aneurysms are developed elsewhere. As regards the size of these aneurysms, they vary enormously, of course; some of them are no larger than a large pin's head, while there are others almost as big as a walnut. There is one specimen in the museum which is almost as big as a walnut and which has not ruptured. But usually you may say that these aneurysms at the base of the brain are of about the size of a pea, rarely that of a cherry. They do not, of course, always rupture, any more than aneurysms in any there was detected a right homonymous hemianopsia. This condition had been present for 13 years, as was proved by perimeter charts in the possession of the patient and taken near the date of onset. At that time she was, to use her own words, suffering from "dyspepsia and bloodlessness," and was being treated as an out-patient at a London hospital. Suddenly, one morning, when engaged in her occupation as a tailoress, she had an attack of "dizziness," and noticed that as she carried her hand to the right it disappeared from view, and that generally she was unable to see objects situated to her right side—a state of matters which still persists. Yet, with this exception, she has continued to enjoy fair health, and certainly has been, and still is, entirely free from all symptoms of active intracranial disease. The occurrence of the hemianopsia, it will be allowed, involves the existence of some cerebral lesion, and the sudden development of this symptom suggests most strongly that the lesion was of circulatory origin. The youth of the patient, 21 years, other facts apart, may be taken as sufficient to exclude hæmorrhage. In these circumstances thrombosis inevitably suggests itself, and the relatively "quiet" character of the seizure favours such a view. Even if a diagnosis of embolism be preferred, the absence of cardiac valve disease makes it necessary to allow thrombus formation either in the heart itself or somewhere in the arterial system on the proximal side of the obstructed vessel. Hence, on either diagnosis, the case may be quoted to illustrate one aspect of the possible range of thrombosis in cases of anæmia. On the whole, the probabilities may be claimed as favouring venous thrombosis, and, if this is accepted, the case enforces a view already advanced, that such thrombosis may cause a limited, though definite, clinical expression without, at the same time, producing anything like widespread evidences of cerebral disturbance.

A second case,[4] claimed to belong to the same order, is that of a woman, aged 32 years, who has been under observation during the last few years, and who, save for the facts now to be mentioned, is free from all evidence of organic disease. Her original complaint was of breathlessness and scanty menstruation, and she was found to be the subject of a moderately severe anæmia. Without any other disturbance she suddenly became aware that, as she put it, "I could not see round about me." The visual charts were taken, and a decided contraction of each visual field, but more particularly of the right field, was detected (see Figures). Otherwise there was no evidence of intracranial disease and the general clinical examination of the patient, save for the fact of anæmia, was entirely negative. Gradually, in the following weeks, the fields moved towards their normal limits, but even yet there is absence of peripheral vision in the upper nasal quadrant of the right field, and this, in view of the lapse of time, must probably be accepted as a permanent condition. Here, again, is a limited cerebral disturbance occurring suddenly in a woman free from all evidence of disease other than anæmia. In the circumstances the suggestion of thrombosis in the higher reaches of the visual apparatus on the left side can hardly be resisted. Even if it is objected that the initial bilateral character of the visual disturbance necessitates a bilateral lesion, the argument in regard to thrombosis is not appreciably weakened. And, further, it may be answered that a bilateral lesion as an explanation of the visual disturbances is by no means necessary. When it is remembered that in functional hemiplegia, where, presumably, the central disturbance is confined to one hemisphere, contraction of the visual field, though most marked in the eye opposite to the inactive hemisphere, may be detected also, at least in some measure, in the eye of the same side, it is not difficult to accept an area of thrombosis limited to the hinder part of the left parietal lobe as the explanation both of a temporary limitation of the periphery of both visual fields, and also of a permanent defect confined to the field of the right eye. This is suggested as the interpretation of the present case, which is therefore offered as a further illustration of the range of intracranial thrombosis as this occurs in cases of anæmia.

I next submit retinal embolism as an event of occasional occurrence in anæmia and demanding thrombosis as its interpretation. In my own note-books I find records of three cases of embolism in which no abnormal fact other than anæmia could be detected. The patients were females, aged 21, 27, and 42 years. In none of the cases was there a history of rheumatism and all alike were free from evidences of cardiac disease and of arterial degeneration. That the central artery of the retina was in each instance blocked there could be no doubt. For this, in the absence of cardiac valve disease, no obvious explanation could be found. Yet from the existence either of embolism or of thrombosis *in situ* it was, in view of the fact of arterial obstruction, impossible to escape. Opinions may possibly differ as to which of these two is the more probable, but either involves the admission of clot formation in one or other part of the cardio-arterial system, and this in the circumstances may fairly be attributed to the anæmia. It seems reasonable to suggest that the primary clotting took place in one or other of the two chambers of the left heart and that the cases were therefore true examples of retinal embolism. In some of the fatal cases of chlorosis attended with intracranial venous thrombosis the presence of intracardiac thrombi has been observed, and thus the suggestion here proposed has a certain basis of actual anatomical observation in its favour. It is also true that primary arterial thrombosis has in a few exceptional cases of anæmia likewise been recorded, and therefore this alternative explanation of the cases now under discussion must be admitted as possible. But either view serves the present argument—that obstruction of the retinal artery must be included among the complications which arise in anæmia as a result of the tendency in that condition to the formation of intravascular blood clot.

Lastly, as an occasional complication in anæmia, and possibly due to thrombosis, may be mentioned retrobulbar neuritis. This, in its typical form, is characterised by sudden loss of central vision in one eye without evident ophthalmoscopic change, although at a later date there may be whitening of the disc due presumably to some measure of optic nerve atrophy. These facts demand a lesion in the trunk of the optic nerve posterior to the eyeball, and the suddenness of the event often suggests that the lesion is vascular in nature. It may, therefore, be thrombosis, and the fact that complete recovery may occur is manifestly in entire harmony with this conclusion. No doubt retrobulbar neuritis is also seen in conditions other than anæmia, but this does not qualify the experience that it is occasionally met with in patients free from all evidences of disease except anæmia. Nor does it negative the suggestion that the proximate cause of the condition, whether when associated with anæmia or otherwise, may be thrombosis. It is no doubt true that retrobulbar neuritis is sometimes an event in the evolution of [illegible]. But most certainly it exists apart [illegible]. Indeed, it occurs in patients in whom clinical observation, even when extended over a term of years, fails to detect any evidence of organic disease, and some of these patients are anæmic women, that is, are patients in whom thrombosis is a well-recognised possibility. Thus there seem to be reasons to accept the view that while some ocular complications in anæmia may be due to thrombosis of the intracranial veins and sinuses, others may depend upon thrombosis in the vessels, probably the veins, of the peripheral visual apparatus, and among these latter may be placed retrobulbar neuritis. But the possibility of a peripheral thrombosis cannot be limited to cases coming typically under this diagnosis. The fact is that the unilateral ocular complications of anæmia range from a greater or less degree of papillitis without prejudice to vision to a condition of complete loss of visual acuity with little or no ophthalmoscopic change. And between these two extremes there are intermediate cases which show in varying proportions, as it were, some measure both of papillitis and of visual defect. Assuming thrombosis as responsible for these facts, it is readily conceivable that the several varieties and combinations may be determined by the particular site at which the formation of blood clot takes place. Should this occur at or near the optic disc it may well produce exudation and hæmorrhages of a more or less serious degree upon and around the disc—a papillitis, in short; and with such a condition, as is common knowledge, there is no necessary decline of visual acuity. On the other hand, should thrombosis affect vessels in the trunk of the optic nerve behind the eyeball serious interference with vision, and especially with central vision, will be a prominent symptom, although, at least in the early stages of such a case, the fundus may case. I doubt whether it is often possible, strictly speaking, to make a diagnosis, to be certain that a person has such a thing as this. But, after all, that is not the important point; the important point to you all from the point of view *of your patients is to be alive to the possibility of an* aneurysm being present and to directing whatever treatment you may think fit with that idea in your mind. I cannot sum these cases up in one word like one might the other cases, but they are *cases in which the main phenomenon is* that the disease runs its course in two stages. There is a period during which certain symptoms develop and lead the patient to seek advice. The symptoms such as I have seen in these cases have always been obscure and have sometimes been trivial. Then after a short duration, a few weeks perhaps, or sometimes only a few days, the second stage of the illness develops, hæmorrhage occurs, and there is then no doubt about the nature of the underlying trouble. Now these cases are infinitely more important than any of the others in the three groups which I mentioned previously. Cases in which no symptoms develop are clearly of no importance clinically. The cases which are simply those of violent cerebral hæmorrhage are also of no very great clinical importance, because it is not very likely that the gravity of such a case will be overlooked. The cases in which the *symptoms of tumour are mimicked* are of no great importance, because there again a competent man is not likely to overlook the existence of serious disease. But these other cases in the fourth group are precisely those that are liable to be overlooked. *The patient is supposed to have very little* the matter with him and then suddenly he *falls back dead in* the course of the development of symptoms which have lasted only a few minutes, and you may incur grave discredit from having made *light of the previous symptoms* which receive their full explanation at the time of the *fatal seizure.*

---

[4] Mr. T. Brittin Archer's case.

With regard to describing the illness in these cases, it is rather difficult, because the symptoms vary so much. But usually the illness has been short and is ushered in with a seizure of some kind; I cannot put it more *definitely* than that. The patient is thought to have had a fit of some kind; sometimes he is simply said to have fainted. A very little examination *reveals* at once that the fit has been peculiar, that it has not been an ordinary fainting fit, nor has it been an ordinary epileptic fit. It has very often been a fit of sudden *tonic rigidity*, with very likely one of the most *characteristic features* of all, rigidity of the neck. But at any rate the illness is ushered in with a seizure and with either complete or partial loss of consciousness, usually, I think, complete. In the cases which I have seen the patient has suddenly *lost consciousness* and he has been supposed to have had a fit; also, he nearly always vomits in this attack, and this vomiting is the disturbing element to the practitioner, because the case is so often read the other way about. He is *supposed to have* had a vomiting attack on account of some trivial cause, and the other phenomena which have subsequently developed have been attributed to the exhaustion and the vomiting or to the poisoning which has been supposed to cause the vomiting. There was a case that I recorded 14 years ago of *a porter* (one of the hospital porters) who died from this disease, and here is the aneurysm. The history was as follows. During a fortnight he had complained of slight occipital pain and some stiffness of the muscles at the back of the neck; this he attributed to exposure to a draught. He was sufficiently well to do his work as hospital porter on Feb. 2nd. On the next day he had for breakfast some bacon which he thought rancid and subsequently vomited. He went to bed and felt better. Now we come to the important point. Towards evening his wife said that he looked at her in a *strange way* and she *thought* that he must have had a fit. He vomited three times in the course of the evening. That is the kind of history which you get with these cases: that there has been a seizure of a vague kind accompanied with some loss of consciousness and frequently with vomiting. Not uncommonly these people have in addition intense giddiness which is an important symptom, and they also not uncommonly have noises in the head. In the case which I have just quoted the man had had *noises* in the head for six months previously. These noises were probably associated with the local disease of the vessel. But, and I cannot repeat it too often, the *essential point is the seizure*. Subsequently to the seizure the patient recovers *consciousness* and usually *manifests* a paralytic condition of slight degree—that is to say, he feels weak, and though *he is not definitely paralysed* he is unable to walk and this again he very likely attributes to the exhaustion caused by the vomiting which he looks upon as due to indigestion. If you *examine the patient at this time you will often find that* he has no knee-jerks. This fatal case which occurred a few days ago illustrated that. The patient was brought here with weakness of the extremities, there was no actual palsy, and he had no knee-jerks. It is common in many infra-tentorial diseases to have absent knee-jerks and it is one of those little straws in the physical examination of a patient which should make you extremely cautious about doubting the presence of any serious organic disease. Most of these patients a day or two after the attack which I have described are apparently well and there is very little to be made out when you examine them, perhaps nothing except a little stiffness of the neck and a little generalised weakness and possibly absent knee-jerks; therefore great stress should be laid on that physical sign. Of course, they may have other phenomena. The aneurysm may be in such a position as to press on some cranial nerve or on many cranial nerves. The third nerve, for example, *is not uncommonly involved* and that again is one of the reasons which should make you very cautious about giving a diagnosis in doubtful cases of ptosis. Such a severe lesion as aneurysm may be a cause of *ptosis and anyone who has had much experience of ptosis as* a physical sign knows how difficult it is to diagnose the cause of any given case of ptosis. The sixth and seventh nerves, and in fact all the nerves coming from the pons, are prone *to be involved. The hypoglossal* has been known to be involved, but very rarely. The other nerves—the oculo-motor nerves and the seventh nerve—are most likely to be affected. Then, inasmuch as these aneurysms which we are discussing *are basal in position*, they may press on the pons and the medulla in such a fashion as to interfere with their function and to cause *generalised* weakness.

There are other curious phenomena which are apparently *correlated with this position* of the aneurysm. For example, great irregularity of the heart has been described and in the case of the *hospital porter* mentioned above, who was seen by an extremely careful clinical observer at the time of his *first illness, this* physician thought it was a clear case of ptomaine poisoning on account of the vomiting and the very great cardiac irregularity and cardiac enfeeblement which were present. It was, of course, easy to read it afterwards and to *get the correct interpretation* but very difficult at the time. Retention of the urine is another curious and apparently *trivial symptom* which these patients may have. One patient was brought into the hospital because he had *retention of urine, not* because he had any head symptoms. There was no suspicion of his having a head lesion, but he came because he had not passed urine and it was not very convenient to draw off his urine where he lived. So *in addition to symptoms of generalised* weakness in the extremities there are such conditions as cardiac irregularity and (as I should have mentioned earlier) respiratory irregularity and disturbance of the sphincters. Our patient a few days ago had a curious *symptom* the significance of which I am sorry to say I failed at the bedside to realise, but which I ought to have recognised—namely, loss of sight in one eye. You will find that that has been described in not a few cases. There are, I think, two other specimens showing aneurysms in a very similar position to the one which it has occupied in this case, where the optic nerve was pressed on. I ought now to describe the symptoms which this patient had. *On April 27th*, when at work, he suddenly had a very bad headache, and the headache was vertical. He vomited and then he went home. After he got home he became unconscious and remained so for 20 minutes and was stiff and rigid. *There, you see*, was the seizure which I was talking about. Subsequently to that he vomited on several occasions for three days, and on *recovery of consciousness* he experienced a numb feeling in the arms and legs and at the back of the head, but he could move the *arms and legs*. Subsequently he noticed loss of sight in one eye.

You could not have a better *illustration* of the apparently trivial character of some of the *manifestations* when they are really due to a very *serious* cause. After attacks of this kind the symptoms subside and there is nothing much to be made out. *And then suddenly*, after a varying interval, not generally a long interval, the fatal rupture takes place and the case is then simply one of severe histories of the various patients show that operation has in no case been performed where the symptoms were not severe; in fact, one is impressed with the delay rather than with over-haste in deciding to operate. The average duration of the dyspepsia in the patients with pyloric obstruction was over seven years; most of these patients had had one or more attacks of hæmatemesis, and nearly all were incapacitated from work either permanently or at frequent intervals. I believe that in all these cases there is no single one which would have been cured by medical means alone. The longest period which has elapsed between operation and report is five and a quarter years; the shortest (that is to say where the patient has survived) is eight months.

I have tabulated the cases according to the condition found at operation (Table A) and further to five classes (Table B) according to benefit derived that the degrees of success and failure may be more clearly apparent.

TABLE A.—*Condition Found at Operation.*

—	Class 1, relief complete.	Class 2, relief nearly complete.	Class 3, limited improvement.	Class 4, no improvement.	Class 5, death.
a. Pyloric ulcer causing obstruction	22	6	2	3	9
b. Duodenal ulcer...	4	1	0	0	1
c. Adhesions (no apparent ulcer) ...	2	0	1	0	1
d. Gastric ulcer (region not stated)	4	0	4	1	1
e. Ulcer, lesser curvature, and hour-glass stomach...	3	0	2	0	3
f. Ulcer at cardiac end	1	0	0	0	0
g. ? Normal stomach	0	1	0	1	0
h. Dilatation (? paralytic)	0	0	0	0	3
i. Various	1	0	0	2	0

TABLE B.—*Cases Divided according to Benefit Derived.*

	Number of cases.		Percentage.
Class 1. Relief complete	37	=	47
,, 2. Relief nearly complete	8	=	10
,, 3. Limited improvement (operation worth while)	9	=	11
,, 4. No improvement	7	=	9
,, 5. Died shortly after operation	18	=	23

I will first consider the cases according to the success obtained. The absolute joy of living in the cases where the relief is complete and the gratitude shown by patients probably are unequalled in any other operation in surgery. The measure of success in non-malignant cases where relief is obtained may be gathered from the fact that in the 19 patients who could give exact information there was an average gain of weight of 2 stones. Relapse in these cases does not seem to be common. In one case only where at first there was improvement complete and persistent enough to give hope of a permanent cure have I found a marked relapse. This occurred 21 months after the operation. The pain in this case formerly came immediately after food; it now comes three hours later. This fact is difficult to explain. The second class contains those cases where though the relief is very material there is still some persisting symptom, such as occasional vomiting, or where a fairly rigid diet is necessary. I have not considered cases as satisfactory enough for the third class unless the patient definitely states that he has been materially relieved by the operation. These first three classes taken together and forming 68 per cent. of the whole may be considered as successful. The other two classes forming 32 per cent. are failures. Perhaps the most startling result of this investigation is that the mortality in the non-malignant cases has reached 23 per cent.

The consideration and division of results according to the primary gastric condition are more difficult than I anticipated. This is to some extent due to the great influence which the patient's general condition (apart from the local lesion) has on the final result. So largely does the mortality depend on the general condition that I have found it more convenient to consider the fatal cases together rather than according to the local condition. Another difficulty arises from the lack of exact knowledge in many cases concerning the lesion even after operation, and to the frequency of a double lesion. An instance of this last is found in the part which adhesions play in several of the conditions described, and in my tables adhesions probably do not receive sufficient recognition.

A glance at Table A shows that the degree of success and failure in each class is strikingly level. As one might expect, the operation has been performed most frequently for pyloric obstruction. Thus of the 79 operations there was recognised pyloric stenosis in 42. The cases included in this class (Table A, *a*) are mainly straightforward cases of chronic pyloric ulcer with stenosis and in most instances secondary dilatation. Only two are of special interest: in one of these the obstruction followed suture of a perforated pyloric ulcer which occurred 23 days previously; in the other a pylorectomy was done later under the impression that the case was malignant. On microscopic examination the ulcer was found to be cicatricial. There is no preponderant success in these obstructive cases, as the average of successful cases is but slightly better here than in the total number of cases. As regards the results, the following points are of interest. Two of the patients have died recently from pulmonary tubercle; in both of these the relief to the gastric symptoms had been absolute. One of the patients in whom the relief was limited now has definite merycism: the notes of this case mention the repeating of food; they also state that a definite ulcer was found at the pylorus. The other patient with limited relief still vomits bile every few days, but has increased much in weight, formerly having been very thin. A Y-operation has been done since the original operation without much improvement. Thus of the eight partly successful cases (Group *a*, Classes 2 and 3) there is still occasional vomiting in five and slight pain or fulness after meals in three. Of the three complete failures, in one a Murphy's button was used and the opening was apparently too small, for great stomach dilatation persisted with collective vomiting. The passage of bismuth, as shown by an x ray examination, proved that the opening persisted. A further operation by which the opening was much enlarged has recently been performed and so far the result of this is satisfactory. In another case there was no relief at all and vomiting and pain persisted as before. An entero-enterostomy was done later but without effect. This patient has lost one stone in weight since the operation. The third patient only lived 26 months after operation and received no benefit. I have considered the fatal cases below with those of other classes.

The number of operations for duodenal ulcer which I have to report is few, but the results are good, five of the patients being cured or nearly so. In two of these there was distinct stomach dilatation before operation. The patient where the cure is not quite complete still has occasional bilious vomiting and is troubled with palpitation.

Closely related to these classes in so much as obstruction is frequent is that (Class *c*) where adhesions only were found. One of the four cases died; two made a complete recovery. In these the adhesions round the stomach were probably really due to ulcers. In one where there was limited relief the adhesions were very wide, apparently from a leaking typhoid ulcer 11 years earlier. Several operative attempts were made to overcome the chronic obstruction by breaking down the intestinal adhesions and at last a gastro-enterostomy was done with some measure of success.

In the class (*d*) where the region of the ulcer is not stated four cases were completely, and four cases were only slightly, relieved. One of these is the above-mentioned case where pain recurred 21 months after the operation; in two others both vomiting and pain returned, though less than before operation; in the last pain recurred but vomiting ceased.

Again, the small number of cases of ulcer in the lesser curvature causing more or less hour-glass contraction (Class *e*) limits a useful field of inquiry, and the class itself is heterogeneous as it is difficult to decide how much obstruction there was in the various cases. It will be seen that five of the cases showed improvement, though in two it was slight; in one of these, though the patient feels well and the pain after food has disappeared, an increasing difficulty in swallowing has taken place. Apparently the ulcer has extended to the orifice of the œsophagus causing stenosis, or more probably has pulled on it causing distension. A

I first saw the patient at 12.30 P.M. on Monday, 22 hours after the onset of the illness. She was semi-recumbent in bed, cyanosed in face and hands, and looking very ill. At first I could feel no pulse at either wrist but eventually detected a very slight flicker at the right which could not be accurately counted owing to feebleness and apparent intermission. No pulse at all could be made out on the left. The abdomen was greatly distended and tense, mostly in the middle line below the umbilicus, but the distension extended into the right iliac fossa. Here there was distinct loss of resonance, the left and upper part of the abdomen being abnormally tympanic. There was such extreme tenderness that any further examination was impossible. The case did not appear to me altogether like one of appendicitis for several reasons, and rather seemed to suggest an internal strangulation. Preparations were at once made for operation, but under great difficulties. The house was partly dismantled as the inmates were moving. The domestic service was inadequate. But with the help of a nurse hastily summoned we arranged an empty room and secured an operating table and cleansed the patient's abdominal wall. I was glad that with all other necessaries for operation the requisites for spinal analgesia were in my bag as we were so short-handed and the condition of the patient was so extremely desperate as to require an immediate operation or none at all. I punctured in the third lumbar space and injected 5 centigrammes of stovaine and glucose. Analgesia up to the mammæ was rapid and perfect. The muscles of the abdomen became slack and painless in five minutes or less and the patient was much relieved. We could now feel a large swelling nearly in the middle line but more to the right, which was tense and defined and moveable from side to side. It was of about the size of a 12 year old child's head. This determined me to open in the middle line. When this was done from one to two pints of stinking dark turbid fluid gushed out and immediately after I saw black coils of small intestine. These formed a large bundle strangled below by a thick adhesion round the mesentery. The whole bundle was lifted out on the abdominal wall and was seen and smelt to be gangrenous. There appeared to be from 4 to 6 feet of it strangled. As a matter of fact after removal it measured 4 feet 9 inches. In such conditions there was nothing for it but complete excision of the whole bundle of coils. I therefore laid the healthy proximal and distal parts side by side and made a lateral anastomosis, as the distension of the first and contraction of the second forbade end-to-end junction. I then cut away the gangrenous coils in one mass and closed the ends divided and the gap in the mesentery. The abdomen was then mopped of the remaining foul fluid with sterile gauze and closed without any drainage by stitches passing through all coats of the abdominal wall.

The operation lasted one hour and ten minutes, during which the patient felt no pain or sensation except relief of previous distress. Before I left the house the pulse had recovered and was of fair volume at 130. She expressed herself as much relieved but very thirsty. She was given a cup of tea which she at once brought up. This was the only vomiting which occurred up to the end of the case. There was no headache.

The course of convalescence may be easily summarised. There was no shock after the operation. The pulse and general condition steadily improved; the temperature, taken four-hourly, kept between 100° and 101° F. for 11 days. On the twelfth day it rose to 102° and then steadily fell to normal. The last rise was probably due to a stitch abscess which afforded a little discharge. The wound was dressed on the thirteenth day and was found soundly healed. The stitches were then removed and all came out dry except the one mentioned. The bowels acted daily after the third day and food was well taken. There were no complications of any kind.

This case seems to deserve some special notice for several reasons. The onset was very like that of an attack of appendicitis accompanied by perforation, and the rapid aggravation of the symptoms, both general and local, looked very like the supervention of general peritonitis. At the same time the *absence* of vomiting as the abdomen swelled and became tender while the pulse rapidly rose raised a doubt, as did also the normal temperature. That there was some particularly severe intra-abdominal lesion was clear as the tenderness and swelling were rapidly increasing and the pulse-rate was rising and its tension falling until it had almost gone altogether. The patient's aspect also suggested a very severe lesion, for the general cyanosis was most marked in the face and hands. I suggested to Dr. Belcher that we should probably find an internal strangulation. But it was not until the abdominal walls had become quite flaccid under the spinal analgesia that it became perfectly clear that we had not an appendicitis case before us. This relaxation was as complete as could possibly be, and one could feel the rounded well-defined mass almost in the middle line which could be moved from side to side like an ovarian cyst, and one thought of a twisted ovarian pedicle as a possible cause. This was negatived by the flatness and flaccidity of the abdomen at the onset. But though a strangulation from band was suspected I was not at all prepared for the advanced condition of gangrene which was at once found when the abdomen was opened, considering that the strangulation must have taken place within 22 hours—i.e., between 2.30 P.M. after a solid dinner and 12.30 P.M. the next day, when I saw the patient practically pulseless. The gut was perfectly black and stinking, as was also the large amount of gangrenous fluid which gushed out of the abdomen. The bundle of gut (now in our museum) tied at both ends filled a large pudding bowl. It contained dark fœtid blood under great tension, so that the bundle gave the impression of one tense cyst when felt through the abdominal wall.

As to the enterectomy itself it was done in the way I always deal with similar cases, of which I have described several in THE LANCET. I should have resected a larger amount of the proximal bowel but for two reasons. First, I did not know the length of the gangrenous gut in the bundle constricted. It seemed somewhat about 6 feet, but I could not measure it *in situ*, and it might have been more —it was actually 4 feet 9 inches—and I feared to sacrifice too much of the small intestine. Secondly, the lesion had only recently taken place and one hoped that the proximal part was still unaffected by those very grave changes which ultimately take place in all bowel above the strangulated point. To the eye the proximal part was only slightly distended, and to the touch it was healthy and free from œdema and when opened the mucous nembrane looked normal. I therefore used a spot only a few inches above the constriction for the junction with the distal portion which structurally seemed unchanged. Nevertheless, I was uneasy for some days as to whether I had gone high enough up the proximal portion to secure sound tissue for the junction. The result, however, proves that the tissue was sound enough to go through all the processes of repair. The distal portion for about a foot or so below the constriction presented a very interesting appearance such as I have never before seen or known to be described. It was very irregularly constricted, portions being contracted and almost cord-like and portions dilated. Some unusual nerve phenomena must have been present, probably due to pressure by the band; otherwise it seemed to be perfectly normal in texture. No attempt was made to resect the bundle of intestine until the anastomosis had been effected. It simply lay outside the abdomen until the time came to cut it away and to suture the gap in the mesentery. In taking this course no time was lost and extra soiling of the peritoneum was avoided. Nor was any attempt made to cleanse thoroughly the peritoneal cavity before the anastomosis except that by pressure as much foul fluid was squeezed out as possible and the bowels were protected by gauze. When the enterectomy was complete the cavity was swabbed out with gauze as completely as possible, but could only, of course, be regarded as relatively clean. Nevertheless, both the intestinal wounds and the incision in the abdominal wall healed soundly. The stitches in the latter on the thirteenth day came out dry with the exception of one. This supports the view that the peritoneum is able to dispose of much toxic matter if not too severely injured either by the original lesion or by swabbing and irrigation. The latter I very rarely resort to now and mopping is carried out with dry aseptic gauze in the gentlest manner, with due regard to possible pools in the flanks and pelvis, to which fluid would gravitate. In this case the foul fluid appeared to come from all parts of the peritoneal cavity.

As to the anæsthesia, it was perfect from the patient's and of 46 per cent. within two months requires justification, especially as if successful the pain is almost certain to recur and may be no less severe though deferred. On the other hand, in carcinoma of the pylorus vomiting is frequently as distressing as the pain. The latter can be kept under with morphine; we have no specific drug to combat the former. I have no doubt that gastro-enterostomy in many instances relieves the vomiting even though it does not cure the pain. Taking these points into consideration I should therefore recommend that this operation should not be entertained in non-obstructive growths of the stomach and that in obstructive cases the decision should be left largely to the patient without persuasion and with a definite statement of the risk. In early cases only, especially where there is a doubt as to the malignancy, can I recommend that operation should in any way be pressed. Some of the most successful non-malignant cases have been those operated on with the idea that there was carcinoma.

Non-malignant cases.—Here gastro-enterostomy is an operation which may have extraordinarily good results. Patients whose lives have been a misery to themselves and to their friends may enjoy ease which they never thought possible and from being confirmed invalids may be able to do a full day's work. Any operation where this is the case is worth consideration even if the risk is great.

In considering the advisability of gastro-enterostomy two questions arise. Which cases are mechanically suitable? How soon in the illness should the operation be done? As regards the suitability of cases, I have no doubt that where there is obstruction at the pylorus due to chronic gastric ulcer gastro-enterostomy should be performed. The outlook without operation is hopelessly bad and the condition will become progressively worse; the prospect after operation is good. But one must remember that some cases unaccountably fail; a surgeon with a run of successes will have one occasionally where the symptoms are in no way relieved. A more difficult problem arises where there is chronic ulceration but no definite obstruction. Here, again, the outlook without operation is bad, but the prospect of relief by operation is not so good as in the obstructive cases. But some patients certainly do well and I do not believe that pyloric obstruction is an essential in a case that gastro-enterostomy may give relief. I should, therefore, recommend that the operation should be performed as soon as it becomes evident by repeated relapses that the ulcer will be permanent. I believe that where more than two relapses have taken place in a gastric ulcer a comfortable life is improbable apart from operation. A further problem arises in cases where with the symptoms of chronic gastric ulcer the stomach is found on exploration to be apparently normal, or perhaps to be slightly hypertrophical though no obstruction is apparent. Some cases done at a venture under similar circumstances have done well, and I think that the operation is worthy of trial if the general condition of the patient is good. It is very fatal where there is atonic dilatation with general debility. Though there have not been enough cases of duodenal ulcer in this series on which to base deductions, still the results are so distinctly above the average that I have little doubt that gastro-enterostomy should be performed as soon as it becomes apparent by repeated attacks of the typical dyspepsia, severe enough to prevent the patient efficiently carrying on his employment, that medicine and rest will give no permanent cure. I apply this to non-obstructive as well as to obstructive cases of duodenal ulcer. In looking through all the non-malignant cases there is only one (No. 41) where the symptoms are worse after the operation, and here it is the advance of the disease rather than the treatment which has made the difference.

While it is difficult to say whether earlier operation would have lessened the number of failures I feel certain that it would have materially diminished the number of deaths. The suitable time for operation is that at which a decision is first arrived at that the patient will not recover by medical means so as to enjoy life. Delay adds to the risk, for by constant malnutrition the patient becomes less able to withstand the severe operation. I believe that it lies in the hands of the practitioner and physician to prevent much suffering by handing over to the surgeon chronic cases of gastric ulcer and to do away with much of the risk of the operation of gastro-enterostomy by doing this while the patient is still in good condition.

Manchester.

A CASE OF TRAUMATIC SUBDURAL HÆMATOMA TREPHINED THREE MONTHS AFTER INJURY.

BY G. H. HUME, HON. D.C.L. DURH., M.D. EDIN., F.R.C.S. EDIN.,
CONSULTING SURGEON, ROYAL VICTORIA INFIRMARY, NEWCASTLE-ON-TYNE.

IN an interesting address on Some Experiences of Intracranial Surgery[1] Mr. Charles Ballance drew attention to the obscurity which may mark the course of cases of subdural hæmorrhage following injury, and to the fact that the condition is certainly remediable by operation. The following case illustrates strikingly the very gradual development of the results of such an injury, the uncertainty which may beset the diagnosis even when the symptoms have become pronounced, and happily also the satisfactory results which may be achieved by operation. The patient was under the care of Dr. Selby W. Plummer of Durham, to whom and to Dr. W. E. Hume I am indebted for notes of the case and for assistance in its investigation.

The patient, a man between 50 and 60 years of age, fell from his bicycle in the early morning of August 9th, 1907, and received a cut on the back of the head on the left side. He lay unconscious for a few minutes and came to himself standing in the midst of a group of workmen who had come to his assistance. The wound was dressed by a surgeon later in the day. It healed readily and the ordinary habits of life and business were not interrupted. But from the date of the accident he felt vaguely ill and suffered from a constant feeling of anxiety and depression. This feeling seems never to have left him, and in a written statement which he has furnished he gives so graphic an account of his condition to the time of his complete breakdown that I am tempted to transcribe the more salient parts of his story. After dwelling on his ever-present anxiety and trouble of mind, he says:

> About the middle of September I had three weeks' leave (the remainder of my annual vacation), the first few days of which I spent with friends in the country. From there I went on a voyage to Hamburg, where I lived on the steamer in one of the harbours. The sea and fresh air did me good, but I still suffered from want of sleep and the ever-recurring feeling of worry and anxiety about anything I had to undertake. I must confess to a constant urging towards suicide; it seemed so easy to drop overboard in the dark and end all my troubles. When I returned to work I began to suffer from pains in the left side of my head, particularly if suddenly startled or confronted with any difficulty in business, which at that time seemed mostly difficulties. My handwriting deteriorated, my signature became difficult. Towards the end of October I began to have great difficulty in shaving owing to loss of power in my right hand; I also found it trying to walk up stairs and hills. I had very constant urgings to pass water and began to suffer from constipation, a very unusual thing with me. I finally broke down on Tuesday, Oct. 29th, on which day I could hardly sign my name and had great difficulty in getting up the hill on [illegible] home. After my collapse my memory is very confused and I [illegible] hing between things that really [illegible] mer [illegible] our [illegible] luring [illegible] much from my head, but all this I have forgotten.

I saw the patient with Dr. Plummer on Nov. 1st. The scar from the wound referred to was insignificant in extent and free from any sign of unhealthy healing. The patient was drowsy and complained of headache. When questioned he seemed to be curiously on his guard as if afraid of saying the wrong thing. He had vomited suddenly several times. There were distinct loss of power in the right hand, so that he could not sign his name, and less distinct paresis of the right leg. I saw him again on Nov. 7th when all his symptoms had increased in gravity. He was more drowsy and breathed stertorously when asleep. When roused he had a pained and puzzled expression and could not find or form the words he evidently wanted. There was right facial paralysis in addition to more marked affection of the arm and leg. Motions and urine had on several occasions been passed in bed. The knee-jerks were absent and there was no ankle clonus or plantar response. The optic discs were congested, with blurred edges. The temperature was slightly raised and the pulse was of moderate rate, not characteristic of cerebral pressure. Two days afterwards a more detailed investigation of the speech mechanism was made. He could speak but not effect on cretins and also on tissue changes, but whether it acts directly on the cells themselves or has a detoxicatory function—i.e., has a destructive or neutralising action on poisonous substances formed in metabolism—is still *sub judice*. In favour of the latter view, that the thyroid secretion is detoxicatory, is the experiment of Blum[4] who found that thyroidectomised dogs which were doing well on a milk diet developed symptoms of athyroidism directly they were fed on meat. This fact may mean that toxic materials are formed from meat in the intestine which under normal conditions are neutralised by the thyroid secretion or that the products of incomplete metabolism of proteids within the tissues are destroyed when the metabolism is normal but not when the metabolic thyroid secretion is absent.

---

[1] THE LANCET, Dec. 21st, 1907, p. 1741.

There are also other experiments in support of the view that the normal function of the thyroid is detoxicatory of metabolic products. In 1894 Ballet and Enriquez, acting on this theory, injected the blood of thyroidectomised goats into patients suffering from exophthalmic goitre with beneficial results. In 1899 Burghart[5] reported three cases that improved, two markedly so, when treated in a similar way, but he did not confine himself to the use of injections, but administered a dried alcoholic extract of the blood per os. Schultes,[6] Möbius,[7] Blumenthal,[8] and others reported similar successes. Assuming that the quality of the blood is communicated to the milk, Lanz in 1894 treated two cases with milk from thyroidectomised goats. The results were so favourable that the treatment was applied to four other patients all of whom showed marked improvement and gain in weight. Serum from thyroidectomised animals has been made by various firms of chemists, antythyroidin (Möbius) by E. Merck, and thyroidectin, a reddish brown powder prepared from the blood of thyroidectomised sheep (five grains in a capsule, from 1 to 3 thrice daily) by Parke, Davis and Co., and rodagen, a dried powder made from the milk of thyroidectomised goats (dose from half a drachm to one drachm or more thrice daily) prepared by E. Merck. I shall have something further to say about these preparations at a later stage.

There is no doubt, as has already been shown, that thyroid secretion is capable of causing intoxication. Assuming, then, that the hypothesis that exophthalmic goitre is due to intoxication from hypersecretion of the thyroid gland is correct, we have still no satisfactory explanation of the cause of the hyperactivity of the thyroid. It has been suggested that it is due to degeneration changes in the cervical sympathetic, or hyperplasia following an intestinal intoxication, but the intimate relation which exists between the thyroid and the generative organs—the gland often swells at the menstrual period, involutes or atrophies at the menopause, causing myxœdema, hypertrophies at puberty or during pregnancy, causing exophthalmic goitre (this is illustrated in three cases of mine)—inclines me strongly to the view that some abnormality in the function of the generative organs may be the starting point of the thyroid derangement.

Before leaving the pathology of exophthalmic goitre I must refer to the parathyroids—small epithelial bodies which lie in close apposition to the lobes of the thyroid gland, and which if removed in dogs cause muscular twitchings, spasms, exhaustion, and death, a condition of aparathyroidea as it has been called, so that some experimenters attribute the acute nervous and muscular symptoms of total thyroidectomy to the simultaneous removal of the parathyroids, and indeed in some cases of Graves's disease the parathyroids have been found to be atrophied. Against the theory that exophthalmic goitre is due to parathyroid insufficiency the following facts have been drawn up by Wells[9]: 1. Removal of one lobe of the thyroid often causes improvement or recovery of this disease, yet with the lobe of the thyroid is generally removed the adjacent parathyroid, which would decrease the amount of parathyroid tissue and make worse any parathyroid insufficiency. 2. Therapeutic administration of parathyroid tissue or extract has had no significant effect on the disease. 3. No considerable or characteristic anatomical changes occur in the parathyroids in exophthalmic goitre, while the great majority of all cases show hypertrophic changes in the thyroi 4. The parathyroids have no particular influence on met bolism (MacCallum), while metabolic abnormalities are ver marked in exophthalmic goitre.

There is one other point in the morbid anatomy of this disease to which Mackenzie directs attention—i.e., the persistence and sometimes hypertrophy of the thymus, which occurs in so many cases, that he says, "Perhaps every case of persistent thymus is one of potential or latent Graves's disease."[11]

Since 1905 I have treated all cases of exophthalmic goitre which have come under my care with either rodagen or thyroidectin. The results have been so satisfactory that a further trial is strongly encouraged. Of the following 14 cases nine were treated by rodagen: one was cured, seven were greatly improved, and one is *in statu quo*. Five cases were treated by thyroidectin: all were greatly improved, one after non-improvement with rodagen. I will summarise my cases briefly.

CASE 1.—A man, aged 26 years, showed marked symptoms. He was very nervous, restless, did not sleep well, the pulse was 120 with occasional severe attacks of tachycardia, the temperature was frequently raised above normal, he perspired freely, and the circumference of his neck was 16 inches, the right lobe of the thyroid being considerably enlarged. He was quite unfit for work. Indeed, he had all the appearance of passing into fatal toxæmia. No improvement in his condition occurred until he was placed on half-drachm doses of rodagen thrice, and later four times, a day, with immediately good effect. The pulse-rate fell from 120 to 80 per minute, the tachycardia subsided, the tremors lessened, sleep returned, and his thyroid gland gradually diminished in size, his neck becoming 14½ inches in circumference. He had had one or two slight relapses (especially when he had been without rodagen), but I saw him on Jan. 30th, 1908, and his improvement was well maintained. He was able to work, his exophthalmos was less, the pulse was 76 per minute, there was no tachycardia, tremors were barely perceptible, and the circumference of his neck was 14½ inches—i.e., one and a half inches less than when first placed on this treatment. (This case I showed at one of the clinical meetings.)

CASE 2.—A woman, aged 32 years, first came to the Stanley Hospital in 1904. She had all the symptoms and signs well marked, with a five months' history. The illness was dated to a fright during pregnancy. She was treated with rest in hospital and dilute hydrofluoric acid (1 per cent.) and belladonna internally without much benefit. In December, 1905, when she was an out-patient, I ordered her rodagen in half-drachm and later one-drachm doses thrice daily, with the result that in six months' time all her symptoms, including marked exophthalmos, had quite disappeared, and they have not returned. Nevertheless I am bound to admit that during this time she had developed a patch of phthisis in the apex of her right lung, for which she has since been treated, and, I am glad to say, fairly *successfully*. How much of the cure was due to rodagen and how much to the phthisis I was at first in doubt, but as I have now a patient (Case 10) under my care who is suffering from both Graves's disease and phthisis, I think we are bound to give the credit to the drug.

CASE 3.—A woman, aged 32 years. The symptoms were very definite on admission in February, 1906, exophthalmos being so evident that the lids did not cover the eyeballs. After six weeks under administration of rodagen the pulse-rate fell from being over 100 to between 80 and 90 per minute, the eyelids covered the eyes when closed, the circumference of the neck decreased three quarters of an inch, and all the other symptoms greatly improved. She also gained five pounds in weight.

CASE 4.—A woman, aged 32 years, was in the Stanley Hospital at the same time as the preceding case. The symptoms were very marked, tachycardia, sweats, and "flushings" being very troublesome. Whilst in hospital she had an attack of acute tonsillitis. With half-drachm doses of rodagen there was marked improvement, exophthalmos became less, the circumference of the neck diminished three-eighths of an inch, tachycardia and sweatings subsided. She had remained greatly improved, except of 46 per cent. within two months requires justification, especially as if successful the pain is almost certain to recur and may be no less severe though deferred. On the other hand, in carcinoma of the pylorus vomiting is frequently as distressing as the pain. The latter can be kept under with morphine; we have no specific drug to combat the former. I have no doubt that gastro-enterostomy in many instances relieves the vomiting even though it does not cure the pain. Taking these points into consideration I should therefore recommend that this operation should not be entertained in non-obstructive growths of the stomach and that in obstructive cases the decision should be left largely to the patient without persuasion and with a definite statement of the risk. In early cases only, especially where there is a doubt as to the malignancy, can I recommend that operation should in any way be pressed. Some of the most successful non-malignant cases have been those operated on with the idea that there was carcinoma.

Non-malignant cases.—Here gastro-enterostomy is an operation which may have extraordinarily good results. Patients whose lives have been a misery to themselves and to their friends may enjoy ease which they never thought possible and from being confirmed invalids may be able to do a full day's work. Any operation where this is the case is worth consideration even if the risk is great.

In considering the advisability of gastro-enterostomy two questions arise. Which cases are mechanically suitable? How soon in the illness should the operation be done? As regards the suitability of cases, I have no doubt that where there is obstruction at the pylorus due to chronic gastric ulcer gastro-enterostomy should be performed. The outlook without operation is hopelessly bad and the condition will become progressively worse; the prospect after operation is good. But one must remember that some cases unaccountably fail; a surgeon with a run of successes will have one occasionally where the symptoms are in no way relieved. A more difficult problem arises where there is chronic ulceration but no definite obstruction. Here, again, the outlook without operation is bad, but the prospect of relief by operation is not so good as in the obstructive cases. But some patients certainly do well and I do not believe that pyloric obstruction is an essential in a case that gastro-enterostomy may give relief. I should, therefore, recommend that the operation should be performed as soon as it becomes evident by repeated relapses that the ulcer will be permanent. I believe that where more than two relapses have taken place in a gastric ulcer a comfortable life is improbable apart from operation. A further problem arises in cases where with the symptoms of chronic gastric ulcer the stomach is found on exploration to be apparently normal, or perhaps to be slightly hypertrophical though no obstruction is apparent. Some cases done at a venture under similar circumstances have done well, and I think that the operation is worthy of trial if the general condition of the patient is good. It is very fatal where there is atonic dilatation with general debility. Though there have not been enough cases of duodenal ulcer in this series on which to base deductions, still the results are so distinctly above the average that I have little doubt that gastro-enterostomy should be performed as soon as it becomes apparent by repeated attacks of the typical dyspepsia, severe enough to prevent the patient efficiently carrying on his employment, that medicine and rest will give no permanent cure. I apply this to non-obstructive as well as to obstructive cases of duodenal ulcer. In looking through all the non-malignant cases there is only one (No. 41) where the symptoms are worse after the operation, and here it is the advance of the disease rather than the treatment which has made the difference.

While it is difficult to say whether earlier operation would have lessened the number of failures I feel certain that it would have materially diminished the number of deaths. The suitable time for operation is that at which a decision is first arrived at that the patient will not recover by medical means so as to enjoy life. Delay adds to the risk, for by constant malnutrition the patient becomes less able to withstand the severe operation. I believe that it lies in the hands of the practitioner and physician to prevent much suffering by handing over to the surgeon chronic cases of gastric ulcer and to do away with much of the risk of the operation of gastro-enterostomy by doing this while the patient is still in good condition.

Manchester.

A CASE OF TRAUMATIC SUBDURAL HÆMATOMA TREPHINED THREE MONTHS AFTER INJURY.

BY G. H. HUME, HON. D.C.L. DURH., M.D. EDIN., F.R.C.S. EDIN.,
CONSULTING SURGEON, ROYAL VICTORIA INFIRMARY, NEWCASTLE-ON-TYNE.

IN an interesting address on Some Experiences of Intracranial Surgery[1] Mr. Charles Ballance drew attention to the obscurity which may mark the course of cases of subdural hæmorrhage following injury, and to the fact that the condition is certainly remediable by operation. The following case illustrates strikingly the very gradual development of the results of such an injury, the uncertainty which may beset the diagnosis even when the symptoms have become pronounced, and happily also the satisfactory results which may be achieved by operation. The patient was under the care of Dr. Selby W. Plummer of Durham, to whom and to Dr. W. E. Hume I am indebted for notes of the case and for assistance in its investigation.

The patient, a man between 50 and 60 years of age, fell from his bicycle in the early morning of August 9th, 1907, and received a cut on the back of the head on the left side. He lay unconscious for a few minutes and came to himself standing in the midst of a group of workmen who had come to his assistance. The wound was dressed by a surgeon later in the day. It healed readily and the ordinary habits of life and business were not interrupted. But from the date of the accident he felt vaguely ill and suffered from a constant feeling of anxiety and depression. This feeling seems never to have left him, and in a written statement which he has furnished he gives so graphic an account of his condition to the time of his complete breakdown that I am tempted to transcribe the more salient parts of his story. After dwelling on his ever-present anxiety and trouble of mind, he says:

> About the middle of September I had three weeks' leave (the remainder of my annual vacation), the first few days of which I spent with friends in the country. From there I went on a voyage to Hamburg, where I lived on the steamer in one of the harbours. The sea and fresh air did me good, but I still suffered from want of sleep and the ever-recurring feeling of worry and anxiety about anything I had to undertake. I must confess to a constant urging towards suicide; it seemed so easy to drop overboard in the dark and end all my troubles. When I returned to work I began to suffer from pains in the left side of my head, particularly if sudde[illegible] confronted with any difficulty in business, which at [illegible] difficulties. My handwriting deteriorate[illegible] difficult. Towards the end of October I began to have great difficulty in shaving owing to loss of power in my right hand; I also found it trying [illegible] constant urgings to pass water a[illegible] unusual thing with me. I [illegible] which day I could hardly [illegible] ing up the hill on my wa[illegible] ry confused and I have g[illegible] hings that really [illegible] happened and what must have been mer[illegible] something of most days except the four [illegible] operation. These seem a blank, durin[illegible] much from my head, but all this I have forgotten.

I saw the patient with Dr. Plummer on Nov. 1st. The scar from the wound referred to was insignificant in extent and free from any sign of unhealthy healing. The patient was drowsy and complained of headache. When questioned he seemed to be curiously on his guard as if afraid of saying the wrong thing. He had vomited suddenly several times. There were distinct loss of power in the right hand, so that he could not sign his name, and less distinct paresis of the right leg. I saw him again on Nov. 7th when all his symptoms had increased in gravity. He was more drowsy and breathed stertorously when asleep. When roused he had a pained and puzzled expression and could not find or form the words he evidently wanted. There was right facial paralysis in addition to more marked affection of the arm and leg. Motions and urine had on several occasions been passed in bed. The knee-jerks were absent and there was no ankle clonus or plantar response. The optic discs were congested, with blurred edges. The temperature was slightly raised and the pulse was of moderate rate, not characteristic of cerebral pressure. Two days afterwards a more detailed investigation of the speech mechanism was made. He could speak but not drug and with a better understanding of the procedure and an improved technique in carrying it out they have almost entirely disappeared. In this country Mr. A. E. Barker[1] has done more than anyone else to place spinal analgesia on a sound and safe basis. He was the first to advocate the use of an injection compound of greater specific gravity than the cerebro-spinal fluid and to demonstrate that by the use of gravity and a study of the spinal curves a high analgesia could be obtained with perfect safety and regularity. In his method the rise in height of the analgesia is entirely due to his heavy compound travelling to the lowest point of the canal, usually somewhere about the upper dorsal region. There is not the least danger of any effect on the upper cervical region, as this is kept well elevated by raising the head and neck, and it must be apparent that it is impossible for his heavy fluid to travel upwards as it settles by mere weight at the lowest part of the canal. By using this heavy fluid one has definite control over the height of analgesia. Where one relies on the injection compound spreading upwards by diffusion or by shifting of the whole column of cerebro-spinal fluid one has no guarantee that once started upwards one will be able to control or limit it. Barker[2] has now recorded over 200 cases treated by this method with most successful results and without any serious after-effects. Spencer and Houghton[3] have likewise recorded 50 very successful cases. McGavin[4] has recently published 50 cases done by the same method with excellent results. In the following 50 cases practically the same procedure as described by Barker has been adopted and his stovaine-glucose solution has been used throughout. I would like briefly to refer to a few of the more important points.

---

[1] THE LANCET, Dec. 21st, 1907, p. 1741.

Position of the patient.—Careful attention to this is one of the most important factors in the success of the method. *The patient lies on the side* to be operated on with the head and neck well raised, except in hæmorrhoid and perineal cases, where the puncture is done in the sitting position. When lying the knees are fully flexed on the abdomen and held there by an assistant. If single-handed, the method of making the patient grasp his own legs and draw them upwards is a good one. Where a leg is injured as in fracture and cannot be drawn up properly I have found the flexing of one leg sufficient to enable the puncture to be performed. The head and neck are always carefully raised by means of pillows or a rest, thus insuring the safety of the cervical region. As regards elevation of the pelvis, there is no absolute rule, except that at most only a slight elevation, one or two inches, is necessary. It is important to have the patient in proper position with the head raised and the pelvis elevated before the puncture is done, so that as little movement as possible will be required after injection.

Puncture.—This can be done either between the third and fourth or second and third lumbar spines. When done here there is no danger of injuring the cord itself, as this terminates at the lower border of the first lumbar vertebra. The fourth lumbar spine is situated on a line joining the highest points of the iliac crests, so that the position for puncture is easily found. Speaking generally, where the highest analgesia is aimed at it should be done between the second and third spines. Occasionally, however, the interval between the second and third has felt so small and that between the third and fourth so much larger that I have used the latter in preference, and have been quite *successful* in obtaining a high analgesia. Undoubtedly the puncture is most easily and satisfactorily performed absolutely in the middle line, and after a little practice there is little difficulty in entering the dural sac accurately in almost every case. A few exceptional cases may give rise to difficulty, as, for instance, one where the spines could not be felt at all, and where the whole lumbar spine seemed fixed in a forward curve. It was impossible in this case to get the needle in at all. It is important that the needle should be boiled in plain water and not in soda solution, as a trace of this renders the stovaine inactive.[5] I found the nickel needles recommended by Barker to be most satisfactory in every way.

As a rule, from 2 to 2½ drachms of cerebro-spinal fluid should be removed before injecting the analgesic compound. It is striking how in some patients the cerebro-spinal fluid spurts out and in others comes slowly, drop by drop. I have noticed that those cases where the cerebro-spinal tension seems high are more apt to have headache afterwards. It is consequently advisable to draw off rather more cerebro-spinal fluid from them. The compound used has been practically the same as Mr. Barker's and has been specially prepared in ampoules by John Macmillan, Limited, Glasgow: stovaine, 5 grains; glucose, 5 grains; and sterilised water to 100 minims. 1 cubic centimetre (17 minims) is used each time, but as 2 minims remain in the needle one can only count on 15 minims of the solution reaching the canal—i.e., three-quarters of a grain, or about 5 centigrammes, of stovaine are injected. The dose has not been varied almost at all and the most severe abdominal operations have been performed with this dose. A few operations on the extremities have been done with a smaller dose. After injection the patient is gently rolled on to his back, the head and pelvis being kept in the same relative position, and in from five to ten minutes analgesia is usually quite complete and the patient ready for operation.

Height of analgesia.—I have endeavoured by a study of the spinal curves in individual patients to obtain a low analgesia when the operation was on the extremities and only a high analgesia when required. It is obviously unnecessary in operations on the extremities to obtain analgesia to the nipples, and in fact is undesirable, as nausea is more apt to occur with high analgesias. It must be remembered that the spinal curves vary somewhat in different people and also the size of the shoulders and pelvis has an effect on the level of the canal. Accordingly, it is sometimes necessary to modify slightly the procedure in individual cases. In operations on the extremities the puncture is usually made between the third and fourth spines without any elevation of the pelvis, and if thought desirable the shoulders are slightly raised, *so that the analgesia does not usually* spread higher than the umbilicus. Where a high analgesia is desired the shoulders rest on the table, the pelvis is elevated from 1 to 2 inches according to the case, and the puncture is made between the second and the third spines. It seems probable that analgesia spreads upwards more rapidly when the patient is in the lateral position, so it is consequently advisable to keep him on his side from one to two minutes before rolling him on to his back. As a rule the patient has been kept in the same position with the head raised and the pelvis slightly elevated throughout the entire operation, although recently I have been removing the pelvic pad when the analgesia was high enough. By carefully following out these details, slightly modified in individual cases, one can obtain analgesia to the sternum or nipples without the least danger. In no case has there been any difficulty with the breathing, even although analgesia has several times been noted from 1 to 2 inches above the nipples. The Trendelenburg position has never been used and two inches have been the utmost amount of pelvic elevation. No morphine or scopolamine has been given previous to operation. A screen is placed between the patient and the field of operation so that he cannot see what is going on and everything is done as quietly as possible. It is most important that someone should engage the patient in conversation and keep his attention occupied during the operation. His head and neck should be kept raised while he is being removed from the theatre and he should be well propped up on his return to bed. It is hardly necessary to add that, of course, strict asepsis is essential to the safety of spinal analgesia. I have now carried out this method in 50 cases and have found it very satisfactory. From the following list it will be seen that it has been used in a large variety of surgical conditions.

The following is a summary of the abdominal cases: Appendix (quiescent), 9 cases; appendix (acute), 3 cases; laparotomy above umbilicus, 4 cases; intestinal obstruction, 3 cases; and fæcal fistula of cæcum, 1 case; total abdominal operations, 20 cases. The operations on other parts of the body comprised: Inguinal hernia, 6 cases; removal of testis, 5 cases; removal of semilunar cartilage, 2 cases; removal of renal calculi, 1 case; circumcision, 1 case; varicose veins, 2 cases; hæmorrhoids, 5 cases; wiring patella, 1 case; plating fracture of tibia, 1 case; and suprapubic prostatectomy, 1 case. Failure to produce with occasional feverish attacks; lately he had become very lethargic, unwilling to exert himself, and mentally somewhat dull and apathetic. He had frequent backache and supra-orbital headache. He appeared to be a quiet, somnolent, emaciated man, with a heavy, slightly anxious expression. He required to be aroused before he answered questions; his replies were delayed. He estimated time incorrectly, placing the events of the previous week as a few hours past. He had forgotten that he was ever in Africa. After laborious computation he added and subtracted single figures; he failed entirely with double numbers. In multiplication he showed a curious and persistent error, always using a multiplicand one less than that given to him—thus, for example, making 4 by 12 equal 44; 2 by 9 equal 16. He said he was perfectly well, that he required rest, and relapsed into lethargy when left alone. The knee, Achilles, biceps, triceps, supinator, extensor, and flexor of wrists and jaw-jerks were all exaggerated. On eliciting either knee-jerk a response was obtained in the other leg. The plantar response was very active and flexor in both feet. The cremaster, abdominal, and epigastric reflexes were faint; the corneal, palatal, and bulbo-cavernosus were active. There was no incontinence of urine or fæces on admission. The eyes showed equal pupils, regular in outline and slightly dilated, they reacted to light and for accommodation; no strabismus was present; there was slight jerkiness of outward rotation, no actual nystagmus; convergence was good; there was no lagophthalmos and the fundi were quite normal. Hearing was acute; the right membrane was slightly congested. Speech was slow and slightly thick or mumbling, response to questions being very slow. The response to touch was normal over the chest, abdomen, and upper arms; hypersensitive over the forearms and feet. Pain was somewhat difficult to determine; there were distinct areas of hyperæsthesia over the body and limbs. Heat and cold were accurately discriminated. Considerable incoördination of hands and feet was shown. The gait was slow, the patient shoving his feet along the floor. No Rombergism was present; there was a very slight degree of heel-stamping. Marked myotatic irritability was present. Emaciation was general and equal on either side. The thighs measured 11½ inches, the upper arms 8 inches; the other measurements were similarly reduced. The weight was 5 stones 9 pounds and the height was 5 feet 6 inches. The inguinal, axillary, intercostal, supraclavicular, submaxillary, and concatenate glands were all enlarged; there was interscapular dulness to percussion over the mediastinal glands. In the right groin one of the glandular masses was swollen, red, and painful. The thyroid was not enlarged. The blood was anæmic; the red cells numbered 3½ millions per cubic millimetre; the whites numbered 6500; polymorphs, 51 per cent.; lymphocytes, 29 per cent.; large mononuclears, 15 per cent.; and eosinophiles, 5 per cent. There was slight poikilocytosis; the hæmoglobin was 60 per cent. The heart was slightly dilated; there were systolic, functional, mitral and pulmonary bruits. The lungs were healthy; there was dulness to percussion over the mediastinum posteriorly, probably due to enlarged glands. The Calmette ophthalmo-reaction was negative. The abdomen was tumid and slightly resistant. The spleen was enlarged, the vertical axillary diameter being 6 inches and the horizontal diameter 5 inches. The vertical diameter of the liver in the mid-clavicular line was 6 inches. The urine had a faint trace of pus and albumin but was otherwise normal. The skin was dry, somewhat papular, showing patches of erythema in places; considerable itching was felt. On admission the temperature was 97° F., the pulse was 84, and the respirations were 24.

---

[5] Dean, Meeting of the British Medical Association, 1907.

The patient was put upon a liberal diet of chicken, veal, and other white meats with two pints of milk in the day. As his condition might possibly have been due to the effects of syphilis he was given potassium iodide grains 40, and liquor hydrargyri perchloridi minims 60, four times daily, and this was continued until Sept. 28th, the patient bearing the drugs well but showing no improvement in his condition. He required to be roused at meal times but took whatever food was given well. On Sept. 14th incontinence of urine and fæces had occurred several times; there was considerable mucus in the stools. His weight was now 5 stones 9 pounds, showing no loss. Slight pyrexia of two days' duration occurred, the highest temperature being 99·8°. His general condition was unchanged. On the 18th he had had a pyrexial attack of four days' duration, the highest temperature being 102·4°. No rigors occurred. Twitching of the left arm and leg had appeared, which increased on voluntary movement. The albumin had disappeared from the urine. Lumbar puncture was performed on the second day of the pyrexia; there was a marked lymphocytosis but the trypanosoma was not detected. The patient was greatly collapsed subsequent to the puncture and the needling was not repeated. On the 25th the following note was taken: "During the past week the tremors have become general; they are now most marked on the right side. The knee-jerks are greatly increased and a crossed reflex is given. The gland in the right groin is discharging. On excising a gland from the groin numerous cocci were found but no trypanosomes were discovered. Occasional retention of urine necessitated catheterisation. Rigidity of neck and limbs was present at times. There were emotional outbursts when sore was dressed."

The condition was now diagnosed as sleeping sickness on the following grounds. Syphilis was excluded by the absence of history, the healthiness of the wife and children, and lack of response to three weeks' vigorous anti-specific treatment. The cerebral symptoms of general paralysis were wanting. The reflexes, gait, and history negatived tabes. Tubercle bacilli were not present in the urine, sputum, spinal fluid, or gland excised; the Calmette test was negative. Uræmia was discounted by the rapid return to normal of the urine, the absence of œdema, papillitis, arterio-sclerosis, and other symptoms of chronic renal disease. On the other hand, we had the definite West African history. The mental and physical lethargy agreed with the accounts of Laveran, Bruce, Nabarro, and Greig. The general gland enlargement, together with the pathological condition of the one excised, agreed with the reports of Bettencourt and Mott, who lay stress on these points. The unstable emotions, the tremors, fibrillary and general, increased on voluntary movement, and their occasional epileptiform character, the rigidity of the neck and other muscles at times, the areas of hyperæsthesia, all agreed with these and other observers. The skin showed the changes marked by Dupont and Low.

The question of not having found the trypanosoma arises; the spinal fluid was only examined once and that during an attack of pyrexia; this, according to Moffat, is a most unfavourable time. In cases reported by such observers as Dutton, Todd, Christy, Broden, Dupont, and Dias they failed to find the organism. Kudicke in one of his cases found it only after inoculating a monkey. According to Nabarro the previous drug history could have accounted for the absence of the organism in the spinal fluid; he also suggests the probability of a periodicity in its appearances necessitating constant examinations. At the time we were not acquainted with the importance of frequent gland puncture. According to Mott's reports the glands which he examined contained pyogenic organisms such as were present in this case.

In view of the favourable results of Thomas and Breinl we decided to treat this case with injections of atoxyl, and from Sept. 25th to Oct. 2nd inclusive a solution of atoxyl was injected every four hours in increasing daily doses of from 1 to 5 grains. On Oct. 5th it was decided to adopt the more recent combined atoxyl and mercury treatment of Moore, Nierenstein, and Todd. On the first day 16 minims of saturated watery solution of atoxyl were to be injected into the basilic vein, on the three succeeding days 32 minims were to be similarly injected, after one day without treatment intermuscular injections of 32 minims of 2 per cent. hydrargyri perchloridum were to be given for three days, then—after a suitable interval—the eight-day course of treatment was to be repeated. On the 6th, at the commencement of this scheme of treatment, the condition was as follows. The lethargy and drowsiness had increased greatly; he was quite incontinent and required to be fed by the nurse; tremors were constantly present; there was considerable head retraction; there were bed-sores over the sacrum, left shoulder, and iliac crest; the mouth was foul; the face was drowsy, heavy-lidded look, with wrinkled forehead; when aroused he could answer questions only after long delay and intense mental exertion. The temperature had become subnormal and remained so until Dec. 3rd. The weight was reduced to 5 stones 4 pounds. The patient was on a water-bed and was fed four-hourly. The temperature was 97°, the pulse was 88, and the respirations were 24. On Oct. 13th (the date of the completion of the first course of injections) he continued incontinent; the bed-sores were stationary. He was a little brighter at times during the day. The tremors and head retraction continued. The man, aged 20 years. There was a troublesome puncture and bleeding, blood coming with cerebro-spinal fluid. The patient got analgesia up to one inch above the pubes, but as it was an appendix operation a general anæsthetic had to be given. Case 39, a man, aged 25 years, *with varicocele*; there was an easy puncture and only a partial analgesia was obtained. The skin incision caused some pain and a general anæsthetic was necessary. Case 43, a man, aged 57 years. There was a troublesome puncture, blood coming with cerebro-spinal fluid. Absolutely no effect was produced. McGavin[6] has also recorded three very similar cases where little or no effect was produced.

Three explanations of these failures have been offered: (1) inactive stovaine; (2) a failure to land the full dose within the spinal theca; and (3) insusceptibility of the patient. I feel convinced that the cause in cases such as the above is the fact that the compound has not been wholly landed within the dural sac, but has really been injected outside. It is possible for this accident to occur even though cerebro-spinal fluid has been got. By using Barker's fine cannula it is hardly possible for the injection to escape between the needle and the post layer of the dural sac unless the patient moves at the time of injection when the point might slip out. With a very lax sac, however, it is quite easy to puncture both layers of the sac and when injection is made for the whole or part of the compound to escape anteriorly. This is undoubtedly not common, but I suggest it as accounting for some of the cases where no effect has been produced. I had one other case where the injection caused absolutely no effect, and so convinced was I that the compound had not entered that I repunctured and again injected the full dose. This acted in absolutely the usual way. I was not able to give any of the three failures a second injection, but had it been done, failure might have been prevented. It is difficult to say whether the fact that blood came with the cerebro-spinal fluid and in one case continued to do so even after two drachms had been withdrawn, had anything to do with the failure. It is, of course, always a possibility that the stovaine may be inactive, but when freshly and carefully prepared this is not likely. Provided the full dose of active stovaine is injected accurately within the sac it is hardly conceivable that it should act on the nerves of one person and fail utterly to affect those of another. I feel that the explanation of idiosyncrasy is only to be accepted when all others fail. Where the analgesia cannot be got to rise it is always possible that some of the heavy compound has run down into the sacral curve and got imprisoned there. While these failures are undoubtedly flaws in the method I feel that they are all preventable and with increased skill and experience will not occur at all.

Length of analgesia.—The longest operation performed was a fæcal fistula of the cæcum which lasted 80 minutes. Analgesia to a needle has been noted in the legs as long as two hours after injection. Generally speaking, however, analgesia from 50 to 90 minutes can be relied on, with rather a shorter period for the epigastric region.

After-effects.—No bad results of any kind have developed afterwards which could be traced to the analgesia. Headache and sickness are occasional sequelæ but have not been marked in our series. 35 of the cases have had absolutely no headache or sickness. Five cases, mostly nervous patients, have been troubled with sickness and five have had some headache which, however, has always been controlled by aspirin or phenacetin. It is to be noted that none of the acute abdominal cases have had the least trace of headache, nausea, or sickness. The paralysis of the legs has always passed off completely in from one and a half to three hours, and no prolonged or permanent paralysis has been seen. There has never been any trace of meningeal irritation. One case was operated on twice with stovaine, and at the second operation, five days after the first, the cerebro-spinal fluid was found quite normal. Paralysis of the external rectus of the eye, which has been recorded,[7] has not been seen in any of the cases. Retention of urine does not seem to be more marked after using spinal analgesia. As a matter of fact, most of the hernias and abdominal cases passed urine themselves. Tympanites has been present next day in a certain number of the cases but never to any marked extent. As many as possible of the cases have been examined a month or six weeks after dismissal and have been found absolutely well.

Shock.—The question whether spinal analgesia prevents shock is one of the greatest importance and has been urged as one of its chief advantages. Dean,[8] who has drawn special attention to this aspect of the subject, is of the opinion that it is the method *par excellence* in acute abdominal cases where shock is feared. One of our abdominal cases, an operation on the stomach and transverse colon of 80 minutes' duration, undoubtedly suffered from shock three hours later, but in her case the analgesia had passed off before the end of the operation and some chloroform was required for closing the abdominal wall. None of the other cases have shown any signs of shock and everyone has been struck with how satisfactory the method is in weakly patients and in acute abdominal conditions. It is also striking that such procedures as dilatation of the sphincter, ligature and division of the cord, division of the foreskin, and division of the peritoneum not only give rise to no pain but do not affect the pulse in the slightest degree.

Conclusions.—In ordinary healthy people it comes to be a matter of choice whether spinal analgesia is used or not. Those who have a dread of general anæsthesia will, as a rule, choose spinal analgesia, and there now seems no reason why they should not have the benefit of it. Nervous patients, on the other hand, will usually prefer general anæsthesia. It is, however, when an operation has to be performed on a patient unsuited for general anæsthesia that the great advantage of the method is seen. When properly used it has no bad effect on the heart or lungs, and is therefore much safer in some cases. I have also been struck with how well suited it is for certain types of cases which are unfavourable for general anæsthesia, such as old people with arterio-sclerosis, weak, feeble patients, and those suffering from certain acute abdominal conditions. Alcoholics who are notoriously troublesome to anæsthetise do excellently well with spinal analgesia. Tuffier[9] also points out that it can often be safely used where an operation has had to be abandoned on account of anxiety with the anæsthetic and records two cases of this nature. In our own series we have had two cases (a fæcal fistula and a hæmorrhoid case) where the patients took the anæsthetic so badly that it was discontinued. They were both operated on next day under stovaine without any anxiety.

From a study of the recorded cases and from my own experience of this method I feel that it can now compare favourably in point of safety with general anæsthesia. Moreover, I think there is little doubt that in a fair number of surgical conditions it is the safer and better method and its use gives the patient an increased chance of recovery. At the same time it must be clearly understood that a careful study of the subject and the utmost care in carrying it out are necessary to insure its success and safety. Dr. J. Crawford Renton has operated on the majority of the cases and has been much pleased both with the analgesia and with the condition of the patients after operation. I am indebted to him for opportunities of carrying out this method. I would also like to thank his house surgeons, Dr. T. P. Grant and Dr. H. M. Grainger, for their assistance.

Glasgow.

AN APPLICATION OF OPSONIC METHODS IN COMPARING HUMAN AND BOVINE TUBERCULOSIS.

BY F. L. POCHIN, M.D., C.M. EDIN., D.P.H. CAMB.

UNTIL 1901 it was generally thought that tuberculosis in animals and man was one and the same disease. In that year, however, Koch created a sensation among those assembled at the British Congress on Tuberculosis by stating that, in his opinion, human tuberculosis differed from bovine and cannot be transmitted to cattle. Further, he maintained that bovine tuberculosis is scarcely, if at all, transmissible to man.[1] His opinion, it will be remembered, was arrived at as the result of the following experiments. 1. Six bovines were fed for seven months with food mixed with sputum of a dog-fish, and there was absence of sweat. This condition also affected the upper arms and to a less degree the forearms—the flexor surfaces rather more than the extensor. The hands were not so much affected but the skin was dry and inelastic, and the nails were atrophic and curved over the finger-tips. The lower limbs were similarly affected; the thighs more than the legs, and the flexor more than the extensor surfaces; there was a good deal of keratosis on the feet. Enlarged lymphatic glands could be felt in front of and behind the ears, behind the angle of the jaw, in the submaxillary and submental regions, in front of and behind the sterno-mastoids, below the occiput, in the axillæ; one over the second left rib, above the internal condyle of the humerus on each side, and in the groins. The glands were of moderate hardness, separate, and somewhat tender on pressure. There was slight beading of the ribs. The limbs were much wasted and the legs appeared tender on pressure. The tibiæ were bowed antero-posteriorly and the shins were thick and rounded but there was no pain on percussion of the bones. Both knee-joints were distended with fluid and fluctuation and patella-tapping were readily elicited; the overlying skin was not reddened but there was increase of heat. The knee-jerks were present and the plantar reflexes were normal. There was no retinitis. The mucous membrane of the tongue and the inside of the mouth was pale but otherwise normal; there was no gingivitis or evidence of oral sepsis; the tonsils were large and pale. A systolic murmur was audible over the heart. The spleen was enlarged and hard; the liver could not be felt. The patient was lethargic and his intelligence was, and always had been, below normal.

[1] THE LANCET, July 27th, 1901, p. 187.

Whilst in hospital the patient's temperature oscillated as a rule between 99° and 100° F.; on two occasions it rose to between 101° and 102°. His pulse on admission was 136; it was 124 on the following day but afterwards kept between 100 and 112. The bowels acted daily and the motions were somewhat loose but otherwise natural. The amount of urine varied between 34 and 54 ounces daily: it was acid in reaction, of specific gravity 1012 to 1015, contained no sugar, and on only one occasion out of five a faint trace of albumin. He weighed 5 stones 9 pounds. Examinations of the blood were made as follows: March 17th, red cells, 1,152,000 per cubic millimetre; leucocytes, 6200; March 18th, red cells, 1,184,000 per cubic millimetre; leucocytes, 6000 in the following proportions:—

"Mononuclears"	4320 per c.mm.	= 72·0 per cent.
Large lymphocytes	370 " "	= 6·1 " "
Small lymphocytes	380 " "	= 6·3 " "
Polymorphonuclears	720 " "	= 12·0 " "
Transitionals	170 " "	= 2·8 " "
Myelocytes	40 " "	= 0·6 " "

No basophiles or eosinophiles. Two normoblasts and two megaloblasts in counting 600 leucocytes. March 26th, red cells, 1,107,000 per cubic millimetre; leucocytes = 7000 in the following proportions:—

"Mononuclears" and large leucocytes	5868 per c.mm.	= 83·8 per cent.
Small lymphocytes	361 " "	= 5·1 " "
Polymorphonuclears	606 " "	= 8·6 " "
Transitionals	127 " "	= 1·8 " "

One myelocyte and one normoblast in counting 600 cells; no basophiles or eosinophiles.

In all films examined there was much poikilocytosis. A few erythrocytes were polychromatophilic, but no basophile granules were seen. Variation in size of the red cells was not so marked as is usual in pernicious anæmia and the average size was perhaps rather less than normal. By a regrettable oversight the hæmoglobin estimations were not recorded. The cell which has been termed "mononuclear" had the following characters. It was spherical and varied much in size. Commonly about 12 μ in diameter, some were considerably larger and a few smaller than this. The nucleus generally filled the cell, but in some instances a narrow segment of protoplasm, containing no granules and stained pale pink with Ehrlich's triacid mixture, was to be seen at one part of the circumference. The nucleus stained deeply but not evenly of a dull slate-blue colour, very different from the light bluish-green of the lymphocytes. Forms intermediate between these cells and lymphocytes and many atypical finely granular eosinophiles were met with. With Leishman's stain no distinction between these mononuclear cells and lymphocytes was possible. Whether this cell should be regarded as a member of the lymphocyte series or as a non-granular myelocyte or even as a still more alien invader of the blood stream it is difficult to say, though on the whole perhaps the first is most probable.

The swelling of the patient's knees diminished whilst he lay in hospital but the lymphatic glands, notably those around the jaw, increased in size and became more tender. On March 30th, a fortnight after admission, death occurred rather suddenly, being preceded for a short time by restlessness and dyspnœa. An examination of the body was made about 12 hours later. The following account is taken from the post-mortem register:—

Body very wasted. P.M. rigidity present. [illegible] Skin everywhere very dry and harsh with, in parts, [illegible] brownish yellow scales; these are most mar[illegible] groins, anterior abdominal wall, and backs of the knees. Subcutaneous and omental fat practically nil. No perirenal fat. Muscles pale and watery looking. Blood watery and appears to be less in amount than normal.

Lymphatic glands: The pre-auricular, cervical, epitrochlear, and axillary glands enlarged. A mass of enlarged glands in the superior mediastinum and two over the lower part of the pericardium. The mesenteric glands not enlarged but those in the lesser omentum and along the portal vein and head of the pancreas markedly so. All the groups of inguinal glands enlarged and a chain of big glands extended along the iliac vessels and lumbar spine to the pancreas. The affected glands were greyish white and [illegible] were round or oval and as large as [illegible] ne were as large as walnuts and a [illegible] a five-shilling piece. On section they were white and showed no evidence of softening.

Brain, 46 ounces. Pale, otherwise normal. Pineal and pituitary bodies normal. Pericardium healthy. Heart, 9 ounces; no tabby-cat striation; no valvular disease; one small patch of atheroma on anterior cusp of mitral valve; no atheroma thoracic or abdominal aorta. Thymus not persistent. Thyroid normal. Tonsils enlarged. Pleuræ healthy, no adhesions or increase of fluid. Lungs: upper lobes very pale; lower lobes red, congested, gelatinous looking; contained air; floated in water. Stomach distended; contained a fair quantity of greenish semi-digested food. Intestines: solitary follicles white and prominent; Peyer's patches not swollen. Liver, 66 ounces, not obviously diseased. Gall-bladder normal; contained bile of normal appearance. Spleen, 14 ounces; enlarged; normal colour and consistence; bright red on section; a spleniculus of the size of a marble was found. Left kidney, 11 ounces, enlarged in all diameters; more wedge shaped than normal adult kidney; very pale; capsule slightly adherent. No trace of right kidney to be found. The right suprarenal capsule appeared normal except for the presence in the medulla of a few white patches evidently of the same substance as that of which the enlarged lymphatic glands were composed; in the left suprarenal the whole medulla had undergone transformation into white brain-like material. Pancreas, 4 ounces; normal.

Knee-joints contained an increased quantity of pale-yellow synovia rather more fluid than normal. The synovial membrane was soft, thickened, and injected. The [illegible] with the convexity forwards at the junctur[illegible] thirds; the margins of the bone were ro[illegible] canal of the femur and tibia contained firm pale-pink marrow, with one or two patches of white deposit and a few small hæmorrhages. Smears of the marrow showed that it consisted [illegible]

The liver gave a well-marked blu[illegible] and hydrochloric acid, the kidney [illegible] slate colour. Neither liver, kidne[illegible] action with iodine.

[illegible] corneum [illegible] ser [illegible] ers [illegible] tissue of which appeared [illegible] and coarser than normal, the coil glands and hair follicles did not appear abnormal, but the sebaceous glands were ill-marked and appeared compressed. Sections of the lymphatic glands showed a mass of cells resembling lymphocytes closely packed together; almost complete disappearance of the stroma of the gland and all distinction between germ centres and lymph channels lost. The spleen presented a similar appearance but the amount of supporting tissue was much greater. Leukæmic deposits were present in the kidney and adrenals; in the liver the portal spaces [illegible] which extended thence in the form of [illegible] The pancreas, thyroid, and tonsils [illegible] the synovial membrane of the knee showed just beneath the endothelium a sharply defined continuous layer of leukæmic deposit rather more than 0·05 mm. in depth; deeper in the synovial membrane were some scattered patches of lymphocytes mainly in the neighbourhood of the blood-vessels.

The chief points of interest in this case may be summarised as follows: 1. The presence of ichthyosis, unusual in that the flexor surfaces were implicated to a greater extent than the extensor. 2. The supervention of a condition of leukæmia characterised by deposits of lymphocytic cells in the lymphatic glands, bone marrow, spleen, liver, kidney, and elsewhere, but anomalous in the profundity of the anæmia, the absence of increase in the total number of leucocytes in the blood, and in the presence of free iron in the liver and spleen. 3. The occurrence of a symmetrical synovitis of the knee-joints due to a leukæmic invasion of the synovial membrane. 4. The fact that the patient had only one kidney.

In conclusion, I must thank Dr. Bannatyne for permission to report this case which was under his care at the hospital;

that in each case the mode of entrance to the body were the same; and I think one might go further and omit this last proviso, for by the method under description the actual

resisting power of the blood, as conferred by the potency of its opsonins, is measured, and, as far as we know, this is the same in the other parts of the body as it is in the intestinal walls.

Unfortunately for the race, the degree of immunity against tuberculosis enjoyed by human beings is not great. Indeed, judging by the incidence of the disease per unit of population, it appears to be small—so small that an increase of two and a half times enjoyed in relation to the bovine variety by no means secures such a degree of safety as to warrant for one moment any relaxation of measures of precaution against infection through milk.

TABLE III.—*Bacilli Ingested by Polymorphonuclear Leucocytes of Healthy Adults (Average of 100 Counts).*

Number.	Human bacilli.	Bovine bacilli.
1	0·99	1·21

Average of 1000 counts	0·863	2·212

While showing some rather wide variations in individuals the above table approximates in its totals and averages very closely to the results shown by *Table II.* and the same remarks apply to it.

A few observations have been made by the writer in the cases of two phthisical patients who are undergoing treatment by Koch's tuberculin T.R. regulated by opsonic methods. In each of these cases the opsonic index has always been taken with bovine as well as with human emulsion to ascertain whether the indices in each set of observations move in harmony the one with the other. So far it appears that such is not the case. The index to bovine bacilli appears to be very little affected by injection of tuberculin prepared from human bacilli. As far as the observations go, however, the use of a bovine tuberculin is followed by a marked rise in the opsonic index to bovine bacilli. The observations are so far very few and this part of the subject will be submitted to further investigation.

In an ordinary country practice the number of cases available for observation is not large and the time over which such observations will have to be spread in order to get an adequate series of cases will naturally be considerable.

I think that the series of observations described in this paper tends to confirm the conclusions of the Royal Commission and to support the view that Koch's opinion was erroneous, and I also hold that this application of the discoveries and methods of Wright and Douglas affords a certain, expeditious, and inexpensive (though tedious) mode of carrying on observations on the resistance of animals to diseases of human origin, and further that it also affords a method of gauging the resistance of human beings to virulent diseases from which man and animals suffer in common.

Fakenham, Norfolk.

EPIDEMIC INFANTILE DIARRHŒA.[1]

BY V. J. GLOVER, M.D. LIVERP., M.B., CH.B. VICT.

I.—*Etiology.*

DURING the course of my practice in the year 1904 I was struck by the great number of cases of epidemic infantile diarrhœa that I met with. Prior to this, as a lecturer on hygiene, it had always seemed to me that our evidence as to its causation was unsatifactory—in fact, it was *nil*. We all knew the months when it was most prevalent and the atmospheric conditions then existent; as also that breast-fed infants usually escaped attacks, but that infants, especially not breast-fed and under one year of age, were the chief victims. Almost universal has been the cry to provide sterilised milk, and in towns depôts were established to supply this commodity with the result that the disease has been less prevalent where the depôts were instituted.

From this result I formed the belief that under certain conditions milk carried the infecting agent. But then there was the disturbing factor—how do the breast-fed infants who contract epidemic summer diarrhœa, small though the percentage be, contract it? This was the stumbling block. In the year 1904 I noticed that while my own infant was sleeping in the garden, with his mouth open and full of saliva, as infants' mouths usually are, several house flies were not only on his lips but actually within the mouth. The child was subsequently attacked by a most virulent diarrhœa. This was in August. From this time I focussed my attention upon the house fly. I found that the great majority of cases of diarrhœa occurred amongst the working class. The conditions of life amongst them entail that the kitchen, which is always small, hot, and stuffy, is, besides being the cooking place of the family, also the one and only living room by day. Food is practically never off the table; the milk-jug and sugar-bowl are at all times in evidence. The kitchen and scullery consequently by their temperature and contents attract the house fly. I have been conducting observations during and since 1904 and I find that "*whenever* there is summer diarrhœa in a house there are also house flies in abundance, particularly in the working man's house." If the dwelling be a larger one, as that of a wealthier man, still in the kitchen and pantries where the food is stored there is the fly again in strong numbers.

In the earlier part of 1905 I propounded my view to Lieutenant H. Pierpoint, I.M.S. (Holt Fellow in Pathology), as to the causation of epidemic infantile diarrhœa. It was as follows: "The house fly is the carrier of the infection of infantile summer diarrhœa. It infects breast-fed infants by creeping into their mouths when they are asleep; a habit of many infants is to sleep with the mouth slightly open or lips a little apart. Such infants' mouths contain a plentiful supply of saliva mixed with milk. Infants which are not breast-fed are *infected* by ingesta—e.g., usually the milk, an infection-carrying fly having fallen into it." As I was too busy in general practice to devote the necessary time to bacteriological research he agreed to help me when the disease became prevalent, as it did later in the year. I provided myself with sterilised milk, taking care to do the sterilisation myself. At different periods I caught flies in infected houses and placed them in a tube of the sterilised without any difficulty across the ward. Nourishment was taken well. The first dressing was done under gas on June 1st, after which he complained of tinnitus in the right ear. Except for an attack of follicular tonsillitis he made an uneventful and uninterrupted recovery. He was able to walk downstairs *ten days after the operation* and left the hospital on June 30th. Marked rotatory nystagmus had been noted on June 4th; it was decidedly weaker on June 6th and was absent on June 17th. Before he left the hospital the patient began to hear the voice again with the right ear *and functional* testing on June 29th gave the following result: left ear, *nil*; right ear, voice three inches, Galton whistle 11048·30 vibrations. Bone conduction to all forks, *nil*. Air conduction, 3C16 and 2C32 = 0, 1C64 = ? perception, C128 = perception, C^{1}256 = – 27 seconds, C^{2}512 = –38 seconds, C^{3}1024 = –19 seconds, C^{4}2048 = –35 seconds.

---

[1] An extract from the M.D. thesis.

The patient spent the greater part of July at Deal and returned to me on July 28th. There was occasional slight buzzing on waking up, but no vertigo. His facial paralysis was improving. I last saw him on Sept. 2nd when over three months had elapsed since the operation. His condition then was as follows. The facial paralysis was much improved. He has occasional slight buzzing in the left ear on waking and after taking tea or coffee. This noise is not constant and nothing like the unbearable, machinery-like tinnitus from which he suffered before the operation. He has never had any vertigo or even slight giddiness since the operation. He stands firmly with the heels together and the eyes closed and has no nystagmus. By air conduction (right ear) he can hear all forks from C^1(256) to C^4(2048) inclusive, but not those of lower pitch, but he still cannot hear any fork by bone conduction. He can converse well by lip-reading and can hear the ordinary voice by means of an ear-trumpet or when spoken close to the ear, and he can carry out his duties with ease and comfort.

The history of these operations on the labyrinth for the relief of vertigo or tinnitus incurable by other means and occurring in non-suppurative cases has already been given in the paper by Lake, already referred to. To recapitulate briefly the instances in which such operations have been performed, the first was that of Milligan,[3] the second that of Lake,[4] who, however, antedated Milligan in publication. The third case, also reported by Lake, was, I believe, the first in which the cochlea was attacked. Four more operations of the kind have been performed by Lake with success. I have been told of one unpublished and unsuccessful case performed in London by another surgeon, so that the one here reported is the ninth operation which has been undertaken. It has been, as the reader will have gathered, in every way successful. The method which I adopted—viz., simple opening of the cochlea, vestibule, and canals, with the destruction of the ampullary soft parts—proved quite sufficient and was unaccompanied by the severe constitutional disturbance recorded by Lake in his first cases in which he removed one or more canals only. In my opinion the attacking of the labyrinth *viâ* the radical mastoid operation is more scientific and certainly more justifiable (and less dangerous) than attempting to divide the auditory nerve in the skull, and this opinion I expressed at the Glasgow meeting of the Otological Society in 1904.[5]

Harley-street, W.

TWO CASES OF PNEUMOTHORAX.

By J. PENN MILTON, M.R.C.S. ENG., L.R.C.P. LOND.

CASE 1.—The patient, a male, aged 20 years, was admitted to the Udal Torre Sanatorium, Yelverton, on July 22nd, 1907, with a history of hæmoptysis off and on since March 1st. He was very pale and anæmic and had lost weight. Consolidation and crepitations were present on the right side from the apex to the fifth rib. There was a fair amount of expectoration. The temperature was above the normal, but it gradually settled down to normal. The patient was putting on weight and the lungs were clearing up. On Sept. 22nd the temperature rose to 102° F. after a short walk, and the patient went to bed. On Oct. 22nd a slight hæmoptysis took place. On Nov. 8th as the temperature had been normal for several days it was arranged for him to get out of doors on the following day. At 5 A.M., however, the nurse found him with acute pain in the right chest, suffering from collapse with hurried respirations. Morphine was given. No physical signs could be heard to indicate the cause, but pneumothorax was suspected and it was easily diagnosable on the next day. Dyspnœa and pain became so urgent owing to accumulation of air in the right pleural cavity that I inserted a cannula in the fifth intercostal interspace and immediate relief followed. A yellowish clear serous fluid escaped. On Nov. 13th I withdrew the cannula, but in a few hours the pain and dyspnœa were just as bad. Re-insertion of the cannula again gave relief. On Nov. 14th I removed the patient to the Charlton Nursing Home at Plymouth to be under the care of a surgeon (Mr. C. Hamilton Whiteford). During the journey the cannula came out. On arrival at the home the patient's condition was so good that the cannula was not re-inserted. From this time forward absolutely uninterrupted recovery was made and the patient returned to the sanatorium on Dec. 20th. From this date to last March, when the patient left, the temperature had been practically normal. The gain in weight since the attack had been 15¾ pounds. The right lung, which was collapsed, had made some progress towards expansion and a fair amount of exercise could be taken. The general condition was good and the disease apparently was arrested.

CASE 2.—The patient, aged 35 years, was admitted to the sanatorium on August 31st, 1907. On arrival he looked ill and his colour was unhealthy and earthy. A hard cough with no expectoration was present. The temperature was slightly above the normal. Consolidation and crepitations were present at the right apex with harsh breathing and prolonged expiration at the left apex. Improvement was quick; the temperature became normal and the general condition became distinctly better. After making good progress the temperature rose, expectoration commenced, and the right apex began to break down. The patient was confined to bed and the temperature was neither amenable to drugs nor to serums. The mental condition gave cause for anxiety; it was such that I advised a change and he was taken to the same nursing home as the last patient. Here progress was again marked with a great reduction in the temperature and an improvement in the spirits of the patient. But after about a fortnight the patient was found to be in a state of collapse at midnight. Dr. H. A. Lyth was hurriedly called in and he found the patient propped up in bed in great distress from acute dyspnœa, cold and livid, the pulse being 150, the respirations 57, and the temperature subnormal. There was no pain. On examination on the next day there were lack of movement on the right side and recession of the intercostal spaces during inspiration. On auscultation over the hyper-resonant area amphoric breathing with loud bubbling râles could be heard. A perforated lung with pneumothorax, which was shut off from the lower half of the chest by adhesions, was diagnosed. After the initial shock was passed the temperature rose again and the disease continued its active course as before, the patient dying on the fourteenth day from cardiac syncope. A post-mortem examination made by Dr. Lyth showed the right lung to be universally adherent, the apex having to be torn away. The lower half, including the diaphragmatic adhesions which were recent, was easily separated. A localised pneumothorax was found over the adjacent parts of the upper and middle lobes. The perforation of a large cavity in the upper lobe showed as a freely open round hole a quarter of an inch in diameter. No fluid was present. There were tubercles in the upper and lower lobes of the left lung.

The two cases compared are interesting from the fact that pneumothorax was present in both cases in practically the same spot. Pain was present in one case and absent in the other. One patient died, the other recovered. The interesting point is whether the insertion of a cannula into the pleural cavity of the one case which recovered, causing a complete collapse of the lung and arrest of the disease, would have been equally successful in the case of the patient who died. Personally, in all future cases of pneumothorax I should feel very strongly inclined to insert a cannula into the

An Address

ON

THE CEREBRAL AND OCULAR COMPLICATIONS OF ANÆMIA AND THE PROBABLE RELATIONSHIP OF THESE TO THROMBOSIS.

Delivered before the Medico-Chirurgical Society of Glasgow on March 6th, 1908,

BY C. O. HAWTHORNE, M.D. GLASG., M.R.C.P. LOND.,

EXAMINER IN MEDICINE AND CLINICAL MEDICINE, UNIVERSITY OF GLASGOW; PHYSICIAN TO THE NORTH-WEST LONDON HOSPITAL AND THE CENTRAL LONDON OPHTHALMIC HOSPITAL, ETC.

MR. PRESIDENT AND GENTLEMEN,—I have the honour to offer to the Society some observations on the cerebral and ocular complications which occur as occasional events in the clinical histories of anæmic women, and I propose to maintain, subject to your better judgment, that the interpretation of these events is to be found *in the intravascular formation* of blood clot. That among the special characters which pertain to the anæmic state there must be included an undue tendency to blood coagulation is generally admitted. At least, this is true so long as the blood is contained within the blood-vessels. When withdrawn from the vessels it would appear that the opposite condition obtains and that clotting is both delayed and incomplete. Upon what exactly this difference depends it may be difficult to say, but the fact certainly suggests that intravascular coagulation in anæmia is dependent less on some particular quality of the blood than on an abnormal state of the circulation; and seeing that such clotting is far more frequent in venous than in arterial channels, and that it is mainly confined to situations where, for anatomical reasons, the movement of the blood is comparatively slow, the suggestion may be accepted that an important or determining factor in the thromboses of anæmia is a delayed or sluggish rate of blood-flow. There are, however, quite a number of rival theoretical explanations of the occasional occurrence of thrombosis in *anæmic patients*, though none of them would appear to have secured anything like *unanimous acceptance*. In connexion with this communication it is not necessary that these explanations should be discussed; nor is it necessary to inquire why, though thrombosis is in exceptional instances a prominent feature in anæmia, the enormous majority of the cases of this condition *give no clinical* evidence of any such tendency. For the most part, indeed, the disease, *at least as seen in the shape* or fashion of chlorosis, pursues a course so uniform and so undisturbed that even a considerable clinical experience may fail to secure a personal introduction to any *development* which owes its existence to thrombotic or other exceptional events. Yet it is beyond dispute that *serious and even fatal* complications sometimes occur in anæmic women, and it is not less certain that the explanation of at least some of *these is to* be found in intravascular clot formation. Hence, whatever be the exact pathological interpretation of this event or of its restriction to a relatively small number of patients, it is necessary to accept thrombosis as an occasional accident in the course of anæmia and to be prepared, both as an exercise in diagnosis and as a practical *responsibility* in regard to treatment, to deal with the situations thus created. One of the *objects of this communication* is to suggest that not only certain acute and serious *complications* but also a number of comparatively minor disturbances occasionally observed in anæmic women owe *their origin to* intravascular blood-clotting. Such disturbances are, perhaps, more frequent than is generally allowed, and if the proposition that they are due to thrombosis *is established they* become of considerable clinical importance. For they then appear as warnings or danger signals of the possibility, or even of the probability, of clot formation on a large scale or in particularly dangerous situations, and they thus claim the special therapeutic measures by which results so *disastrous* may be averted.

In short, the argument here to be presented will be that in thrombosis may be found an explanation not only of various grave, urgent, and well-recognised complications of the anæmic state, but also of certain relatively minor disturbances which appear as occasional departures from the usual course of anæmia *as this exists in its simpler and less* serious types.

Probably the most frequent and obvious exhibition of thrombosis in anæmia is met with in the large veins of the lower limbs. The symptoms include pain, tenderness, and œdema, and there may or may not be febrile temperatures. The thrombosis may extend from the femoral to the iliac veins, and even to the inferior vena cava; and in occasional instances it would appear that the process has been limited to these larger channels. It is rare for the veins of the upper limbs to be involved, but they are not wholly exempt; and the same is true of the large veins of the neck and chest. Of course, in all such cases there is a risk of pulmonary embolism, and the whole of the facts in this connexion have been repeatedly verified by post-mortem examination. Apart from embolism, however, the prognosis in anæmic venous thrombosis is far from gloomy, and it is of interest to note that the circulation in the obstructed veins may be completely restored. This is shown, not only by the disappearance of dropsy, but also by the recession of a collateral circulation, which, as a compensatory process, may have become established in superficial venous channels. Hence it must be accepted—and the fact is important in connexion with the *argument here to be advanced*—that an obstructing clot formed in a vein in association with anæmia may, presumably by absorption or organisation, be so completely removed as to cease to exercise any disturbing effect on the normal flow and movement of the circulation. Such a satisfactory issue has been observed even when the thrombotic process has been so widely spread as to affect the majority of the large veins both of the trunk and limbs.

The next situation to be recalled in connexion with the occurrence of anæmic thrombosis is the intracranial veins and sinuses. Every now and then there is recorded in the medical journals the sudden development of acute cerebral symptoms in a young woman who, save for the existence of anæmia, had previously been regarded as entirely free from evidences of organic disease. The symptoms include severe *headache*, *vomiting*, pain in the neck, retraction of the head, *stupor*, *delirium*, various paralyses, and sometimes double optic neuritis, and in not a few of the cases there has been a fatal issue. In view of these symptoms the diagnosis of intracranial tumour, or when, as is sometimes the case, there are febrile temperatures, of meningitis, can hardly excite surprise. Yet there can be no doubt that most, if not all, of these cases are examples of venous thrombosis within the skull. This position is fully justified by the fact that in not a few instances post-mortem examination has demonstrated the presence of thrombosis in the intracranial veins and sinuses, and has at the same time failed to detect any other lesion capable of explaining either the symptoms or the fatal issue. There are other records in which, with similar symptoms, recovery has followed, and here the diagnosis of intracranial thrombosis has *sometimes been* supported by the development of thromboses in other situations, as, *for example*, in the jugular or femoral veins.

Upon this order of cases two observations may be offered. The first is, that as in thrombosis affecting the veins of the limbs both the obstructing clot and the consequences which attend such obstruction may, in a clinical sense, entirely disappear, the fact of complete recovery from an acute cerebral attack cannot be *successfully* quoted against a diagnosis of intracranial thrombosis as the cause of such an attack. *If* the circulation may be restored after thrombosis of, say, the femoral vein, a similar result may surely follow thrombosis of the cerebral veins and sinuses. Thus, while widespread clot formation in this latter situation may perchance produce a fatal result, a less extensive thrombosis may well be attended by clinical disturbances from which a complete recovery is possible. Hence recovery, whether from a group of symptoms or perchance from a single symptom of manifestly cerebral origin, is entirely consistent with a diagnosis of thrombosis affecting the intracranial veins and sinuses.

The second remark submitted in connexion with severe or fatal cerebral attacks occurring in anæmic women is that such cases may include among their symptoms the presence without any difficulty across the ward. Nourishment was taken well. The first dressing was done under gas on June 1st, after which he complained of tinnitus in the right ear. Except for an attack of follicular tonsillitis he made an uneventful and uninterrupted, recovery. He was able to walk downstairs ten days after the operation and left the hospital on June 30th. Marked rotatory nystagmus had been noted on June 4th; it was decidedly weaker on June 6th and was absent on June 17th. Before he left the hospital the patient began to hear the voice again with the right ear and functional testing on June 29th gave the following result: left ear, *nil*; right ear, voice three inches, Galton whistle 11048·30 vibrations. Bone conduction to all forks, *nil*. Air conduction, 3C16 and 2C32 = 0, 1C64 = ? perception, C128 = perception, $C^{1}256$ = – 27 seconds, $C^{2}512$ = – 38 seconds, $C^{3}1024$ = – 19 seconds, $C^{4}2048$ = – 35 seconds.

The patient spent the greater part of July at Deal and returned to me on July 28th. There was occasional slight buzzing on waking up, but no vertigo. His facial paralysis was improving. I last saw him on Sept. 2nd when over three months had elapsed since the operation. His condition then was as follows. The facial paralysis was much improved. He has occasional slight buzzing in the left ear on waking and after taking tea or coffee. This noise is not constant and nothing like the unbearable, machinery-like tinnitus from which he suffered before the operation. He has never had any vertigo or even slight giddiness since the operation. He stands firmly with the heels together and the eyes closed and has no nystagmus. By air conduction (right ear) he can hear all forks from C^{1}(256) to C^{4}(2048) inclusive, but not those of lower pitch, but he still cannot hear any fork by bone conduction. He can converse well by lip-reading and can hear the ordinary voice by means of an ear-trumpet or when spoken close to the ear, and he can carry out his duties with ease and comfort.

The history of these operations on the labyrinth for the relief of vertigo or tinnitus incurable by other means and occurring in non-suppurative cases has already been given in the paper by Lake, already referred to. To recapitulate briefly the instances in which such operations have been performed, the first was that of Milligan,[3] the second that of Lake,[4] who, however, antedated Milligan in publication. The third case, also reported by Lake, was, I believe, the first in which the cochlea was attacked. Four more operations of the kind have been performed by Lake with success. I have been told of one unpublished and unsuccessful case performed in London by another surgeon, so that the one here reported is the ninth operation which has been undertaken. It has been, as the reader will have gathered, in every way successful. The method which I adopted—viz., simple opening of the cochlea, vestibule, and canals, with the destruction of the ampullary soft parts—proved quite sufficient and was unaccompanied by the severe constitutional disturbance recorded by Lake in his first cases in which he removed one or more canals only. In my opinion the attacking of the labyrinth *viâ* the radical mastoid operation is more scientific and certainly more justifiable (and less dangerous) than attempting to divide the auditory nerve in the skull, and this opinion I expressed at the Glasgow meeting of the Otological Society in 1904.[5]

Harley-street, W.

TWO CASES OF PNEUMOTHORAX.

BY J. PENN MILTON, M.R.C.S. ENG., L.R.C.P. LOND.

CASE 1.—The patient, a male, aged 20 years, was admitted to the Udal Torre Sanatorium, Yelverton, on July 22nd, 1907, with a history of hæmoptysis off and on since March 1st. He was very pale and anæmic and had lost weight. Consolidation and crepitations were present on the right side from the apex to the fifth rib. There was a fair amount of expectoration. The temperature was above the normal, but it gradually settled down to normal. The patient was putting on weight and the lungs were clearing up. On Sept. 22nd the temperature rose to 102° F. after a short walk, and the patient went to bed. On Oct. 22nd a slight hæmoptysis took place. On Nov. 8th as the temperature had been normal for several days it was arranged for him to get out of doors on the following day. At 5 A.M., however, the nurse found him with acute pain in the right chest, suffering from collapse with hurried respirations. Morphine was given. No physical signs could be heard to indicate the cause, but pneumothorax was suspected and it was easily diagnosable on the next day. Dyspnœa and pain became so urgent owing to accumulation of air in the right pleural cavity that I inserted a cannula in the fifth intercostal interspace and immediate relief followed. A yellowish clear serous fluid escaped. On Nov. 13th I withdrew the cannula, but in a few hours the pain and dyspnœa were just as bad. Re-insertion of the cannula again gave relief. On Nov. 14th I removed the patient to the Charlton Nursing Home at Plymouth to be under the care of a surgeon (Mr. C. Hamilton Whiteford) During the journey the cannula came out. On arrival at the home the patient's condition was so good that the cannula was not re-inserted. From this time forward absolutely uninterrupted recovery was made and the patient returned to the sanatorium on Dec. 20th. From this date to last March, when the patient left, the temperature had been practically normal. The gain in weight since the attack had been 15¾ pounds. The right lung, which was collapsed, had made some progress towards expansion and a fair amount of exercise could be taken. The general condition was good and the disease apparently was arrested.

CASE 2.—The patient, aged 35 years, was admitted to the sanatorium on August 31st, 1907. On arrival he looked ill and his colour was unhealthy and earthy. A hard cough with no expectoration was present. The temperature was slightly above the normal. Consolidation and crepitations were present at the right apex with harsh breathing and prolonged expiration at the left apex. Improvement was quick; the temperature became normal and the general condition became distinctly better. After making good progress the temperature rose, expectoration commenced, and the right apex began to break down. The patient was confined to bed and the temperature was neither amenable to drugs nor to serums. The mental condition gave cause for anxiety; it was such that I advised a change and he was taken to the same nursing home as the last patient. Here progress was again marked with a great reduction in the temperature and an improvement in the spirits of the patient. But after about a fortnight the patient was found to be in a state of collapse at midnight. Dr. H. A. Lyth was hurriedly called in and he found the patient propped up in bed in great distress from acute dyspnœa, cold and livid, the pulse being 150, the respirations 57, and the temperature subnormal. There was no pain. On examination on the next day there were lack of movement on the right side and recession of the intercostal spaces during inspiration. On auscultation over the hyper-resonant area amphoric breathing with loud bubbling râles could be heard. A perforated lung with pneumothorax, which was shut off from the lower half of the chest by adhesions, was diagnosed. After the initial shock was passed the temperature rose again and the disease continued its active course as before, the patient dying on the fourteenth day from cardiac syncope. A post-mortem examination made by Dr. Lyth showed the right lung to be universally adherent, the apex having to be torn away. The lower half, including the diaphragmatic adhesions which were recent, was easily separated. A localised pneumothorax was found over the adjacent parts of the upper and middle lobes. The perforation of a large cavity in the upper lobe showed as a freely open round hole a quarter of an inch in diameter. No fluid was present. There were tubercles in the upper and lower lobes of the left lung.

The two cases compared are interesting from the fact that pneumothorax was present in both cases in practically the same spot. Pain was present in one case and absent in the other. One patient died, the other recovered. The interesting point is whether the insertion of a cannula into the pleural cavity of the one case which recovered, causing a complete collapse of the lung and arrest of the disease, would have been equally successful in the case of the patient who died. Personally, in all future cases of pneumothorax I should feel very strongly inclined to insert a cannula into the mysterious aspect. It will, however, be allowed that the condition of anæmia established by hæmorrhage is one in which thrombosis may readily occur, as, indeed, is occasionally demonstrated by clot formation in the veins of the trunk or limbs after considerable loss of blood attending surgical operations. Hence it is not impossible—not even improbable—that free bleeding from a mucous surface may be followed by intracranial thrombosis, and this may be advanced as the cause of the optic neuritis in the cases now under consideration. It is at least suggestive that optic neuritis sometimes occurs in circumstances in which intracranial thrombosis is certainly a possibility, and where an explanation of the neuritis other than thrombosis is not easily imagined. Thus the occasional occurrence of optic neuritis in the acute anæmia following free hæmorrhages from mucous surfaces may be quoted in support of the doctrine that the optic neuritis sometimes seen in chlorosis is dependent on intracranial thrombosis.

---

[3] Journal of the British Laryngological, Rhinological, and Otological Association, August, 1904.

[4] THE LANCET, June 4th, 1904, p. 1567.

[5] Transactions of the Otological Society, vol. v., p. 67.

Another condition in which optic neuritis may appear without any very manifest explanation is suppurative disease of the middle ear. In some of these cases the neuritis is associated with an ocular paralysis, and in others an ocular paralysis exists without any attendant optic neuritis. That is, purulent disease of the middle ear may present ocular complications identical with those which are occasionally found in simple anæmia—namely, optic neuritis and ocular paralysis—and these two events may be associated, or either of them may exist apart from the other. So far as optic neuritis is concerned the suggestion has been made that this may complicate tympanic disease altogether apart from intracranial complications. Obviously this can only mean apart from intracranial complications producing manifest cerebral symptoms, and the suggestion by no means guarantees the absence of sinus thrombosis, to which purulent otitis media is notoriously liable. For the most part, however, an optic neuritis, and perhaps still more an ocular paralysis, developing in the course of suppurative disease of the middle ear, means, without question, some more or less serious development within the skull. This development may be abscess, meningitis, or sinus thrombosis, and to judge from post-mortem records it would appear that of the three it is thrombosis which most frequently gives rise to optic neuritis.

Further, on more than one occasion it has happened that removal of clot from the lateral sinus has been followed by disappearance of an existing optic neuritis, and although in those cases where the patient has recovered it is impossible *absolutely* to exclude meningitis, the absence of evidences of this condition has repeatedly been noted during the operation, and in some of the fatal cases necropsy has demonstrated that meningitis was not present, and that sinus thrombosis, perhaps with more or less œdema of the brain, was the only abnormal intracranial condition that could be detected. Still more, it has on several occasions been found that optic neuritis—and sometimes, too, an ocular paralysis—has existed in middle-ear disease quite apart from any other evidence of cerebral disturbance and yet has disappeared, either without operation or after operative measures restricted to the *mastoid* and tympanum and not involving the cranial cavity. Obviously in these cases there cannot have been a cerebral abscess, and meningitis is improbable or at least is less probable than thrombosis. Among the recognised possibilities of the situation, therefore, there remains only thrombosis, and this, as shown in the records already quoted, is fully competent to explain the ocular conditions to which attention is now directed. In short, both optic neuritis and ocular paralysis may complicate middle-ear disease, and these complications may be explained by intracranial thrombosis, to which such disease may most certainly give rise. In certain fatal cases no intracranial condition competent to explain these events other than thrombosis has been discovered. Is it not, therefore, in the highest degree probable that when either optic neuritis or an ocular paralysis occurs as *the single unusual* event in the course of purulent disease of the middle ear that sinus or venous thrombosis is the responsible cause? And if this is true of middle-ear disease, is not a similar conclusion inevitable in reference to anæmia? In both diseases thrombosis is a possibility; in both such thrombosis occasionally produces severe cerebral disturbances which may include either optic neuritis or an ocular paralysis; and in both each of these last-mentioned facts may exist as the sole unusual event. To find, apart from thrombosis, an element common to the two diseases and able to account for optic neuritis or an ocular paralysis existing as an isolated fact is a task not easily accomplished, and it may therefore be urged that there is at least a strong presumption that intracranial thrombosis is in each instance the correct explanation.

Here, then, are three conditions, namely, acute anæmia, middle-ear disease, and chlorosis, in each of which optic neuritis, apart from other complications, occasionally makes its appearance. In each there is a possibility of intracranial thrombosis, and this must be allowed as at least a possible cause of the neuritis. To suggest some other cause, which is at the same time common to the three diseases now in question, is a demand not readily satisfied. Hence it may be claimed that the study of the clinical history of acute anæmia and of purulent disease of the middle ear adds force to the contention that the optic neuritis sometimes seen in anæmic women is dependent on the occurrence of thrombosis in the veins and sinuses within the cavity of the skull.

From all these facts it might perhaps be concluded that the suggestion of intracranial thrombosis as the cause of the optic neuritis of anæmia is so strongly supported that it needs must command universal assent. This, however, is far from being the case. On the contrary, the proposal excites both incredulity and the opposition of rival interpretations. At the outset criticism applies to it this censure—that as there is no known or conceivable link by which thrombosis as a cause can be connected with optic neuritis as a consequence, the suggestion that the one is the cause of the other is not tenable. To this it may be answered that failure to provide an exact explanation of the mechanism uniting two associated events cannot be successfully pleaded against the proposition that one of these is the cause of the other provided there are, otherwise, valid reasons which render such a relationship probable. Were such a canon of criticism enforced it would, to quote but a single illustration, compel a refusal to accept intracranial tumour as a cause of optic neuritis, for the pathway leading from the one to the other is far from being apparent. Yet, while claiming the protection of this general proposition, it may be advisable to attempt to find some apt and suggestive *reasons on which* a belief in the capacity of thrombosis to produce such consequences as optic neuritis and ocular paralysis *may be reasonably* based. Regarding the latter there can be no difficulty. Indeed, it is universally recognised that thrombosis in certain of the sinuses at the base of the skull does, as a matter of experience, and presumably by pressure on the trunks of the cranial nerves, cause paralysis of the muscles of the eyeballs. Perhaps the most obvious examples of *this condition* are those in which the thrombosis involves the cavernous sinus, and where the resulting paralysis appears *in the distribution* of the third and sixth nerves. But by extension of the thrombosis into, say, the petrosal sinuses, nerves other than the two just mentioned may also be implicated, and in this way a comparatively wide area of paralysis may be produced, presumably by the pressure of blood clot. Again, thrombosis must be considered in connexion with the disturbances likely to occur in the tissues in the immediate neighbourhood of the obstructed vessel. These disturbances include such events as hæmorrhage, œdema, and softening, any one of which, if favourably situated, may readily interfere with the functions of the centre or trunk of one or other of the cranial nerves. Possibly such considerations, though *plainly applying to* ocular paralyses occurring in anæmia, may be said to leave untouched the issue in regard to optic neuritis. Yet even here the chance of finding an explanation is not altogether hopeless. A thrombus, particularly if it is *formed* in one of the larger sinuses, may fairly be regarded as a "foreign body" or "adventitious product" within the skull, and in this *sense* comes under Hughlings Jackson's definition of intracranial tumour. So presented, it appears as a not improbable cause of *optic* neuritis, or at least the connexion between it and optic neuritis is hardly more mysterious than is the connexion between optic neuritis and any other form of "tumour." With this suggestion, too, must be taken the fact that sinus thrombosis pure and simple is very much less likely to be accompanied by general symptoms of cerebral disturbance than is thrombosis affecting the cerebral veins. Indeed, there can be little doubt that a limited sinus thrombosis may occur entirely without clinical evidence of the fact. On the other hand, it is in cases where the cerebral veins are involved—and especially where they are extensively involved—in the officers and the subject be properly taught to students. The third should be *to make a thorough course* of instruction in anæsthetics a necessary part of the medical education of every legally qualified medical practioner, so that before administering anæsthetics on his own responsibility he would have administered a large number under the *supervision of a competent* teacher. There is ample material, not only in our general but in our special hospitals, for the most thorough practical instruction of all our medical students. The fourth reform needed is the registration by all hospitals of all anæsthetics administered, so that it may be possible, at all events as regards such institutions, to ascertain the death-rates of the different agents employed and to watch the effects of any reforms *that may be introduced.*

If such changes as these were effected the public would undoubtedly be protected as far as is possible against deaths under anæsthetics, for they would have at their disposal throughout the country qualified and thoroughly trained practitioners who would realise the responsibilities intrusted to them. Moreover, in our provincial towns and other centres throughout the country there would always be available *numerous practitioners* who, *as the result of the* improved hospital equipment, had held resident or non-resident anæsthetic offices. Such specially qualified practitioners, *whilst practising as surgeons, physicians, or general practitioners*, would be of incalculable value in surgical and in dental practice. It is in the highest degree probable that under such a *régime* deaths during anæsthesia would rapidly decline in number, and that the discreditable incidents now *too often associated with the giving of anæsthetics* for surgical and dental operations would become a thing of the past. It is a matter for great congratulation that the General Medical Council has lately looked favourably upon the more important of the above-mentioned reforms, and it is to be hoped that ere *long legislation may* be *granted* in the directions indicated.

Queen Anne-street, W.

A CASE OF FRACTURE OF THE RIBS, RUPTURE OF THE LUNG, AND PNEUMOHÆMOTHORAX,

WITH NOTES OF THE POST-MORTEM EXAMINATION.

By MARY C. DE GARIS, M.D., B.S. MELB.,
RESIDENT SURGEON AT THE MUTTABURRA HOSPITAL, QUEENSLAND.

A BUSHMAN, aged 50 years, was admitted to the Muttaburra Hospital on August 11th, 1907. He stated that on the preceding Thursday (the 8th) he was thrown by his horse, which then rolled on him. He was alone *with nothing to eat* or drink but some tea until he was brought into the hospital. He said that he coughed up a large amount of blood after the accident, that he passed blood with his urine, and that his bowels had not been opened.

On *examination there were several bruises* on the back of the shoulders. His head was bent forward and his neck could not be straightened without pain. There was an ecchymosis below the right eye. His right arm hung helpless at his side, both passive and active movement being very limited; the humeral head was in *normal position, but the acromion* process was very prominent, and there was apparent crepitus on passive movement of the shoulder. There was no swelling about the shoulder. The clavicle, acromion, and forearm bones were all sound. The abdomen showed no abnormal signs. His *temperature* was 101° F., the pulse was from 120 to 130, and the respirations were 48 There was very severe pain in the right side of the chest, referred especially to the axilla. There was marked orthopnœa (which persisted throughout his illness, he being compelled to maintain the sitting posture *almost constantly*). He was very tender in the right axilla especially, but no crepitus was felt. There was limited subcutaneous surgical emphysema felt in the right side of the neck, not extending below the right clavicle in front, nor quite to the upper level of the scapula behind, nor beyond the *middle line* in front. The respiratory movement of the right side of the chest was very poor. He was coughing up a considerable amount of very blood-stained expectoration, the cough being frequent and distressing. The apex beat was visible in the fifth interspace one inch outside the nipple line; the first sound was slightly murmurish in the apical area, otherwise the heart sounds were clear. On percussion the right side of the chest was found to be highly *resonant*, the upper level of the liver dulness being markedly lowered. There was a very marked diminution of breath sounds in the right side of the chest both anteriorly and posteriorly; the breath sounds were not amphoric, nor was there any metallic tinkling. Some *adventitious sounds* were heard and were considered to be due to crepitus from fractured ribs. There were some tenderness and swelling over the spines of the lower cervical vertebræ, but their position was normal. The urine was very high coloured, acid, of specific gravity 1022, with much albumin, and no blood. Urates were present. The examination made was as limited as possible owing to the patient being in so much distress. The diagnosis of rupture of the lung with pneumothorax was made.

The treatment was as follows. The patient's right side was strapped with Mead's plaster and his arm was bandaged loosely and supported in a sling so as not to hamper the movements of the chest. These measures afforded him great relief, though his *cough remained exceedingly troublesome.* A cough mixture containing some opium was given. His bowels were got freely open. He slept very badly throughout, *sleep being only obtainable by the aid of morphine. The* cough and orthopnœa and restlessness were present throughout, but the expectoration changed from nearly pure blood to a nearly rusty character, becoming very viscid and difficult to dislodge, so that during the last few days the doses of morphine were reduced to a minimum.

On the day after admission crackling crepitations were heard in the left axilla; these persisted. The *stiffness* of the neck disappeared completely after two or three days, and the patient became able after five or six days to move the arm *much more freely, though* never able to elevate it. An ecchymosis became obvious in the right loin about six or seven days after admission.

On August 13th the chest was explored and almost pure blood containing no air was obtained. The respirations reached 70 *on this day and the temperature* varied from 98·2° to 101°. It was considered inadvisable to aspirate in case of hæmorrhage recommencing. On the 16th the chest was again explored and then aspirated in the hope of relieving the distressing dyspnœa; only a few drachms of blood-*stained fluid* and a good deal of air were obtained. This procedure made no difference to the position of the apex beat and apparently did little good; it necessitated the removal of the strapping, which was not replaced. On this day the urine was examined and was found to be free from albumin. On the 17th the surgical emphysema was almost gone and was not observed at all on the 18th. The temperature from the 17th remained subnormal, the pulse became very feeble though less rapid, and on the 19th slight delirium was noticed. Pain below the right clavicle was very troublesome for the two days preceding *his death, otherwise* the patient was much easier than on admission. He at no time exhibited much cyanosis, so that no occasion arose for the performance of venesection. Respiration was always laboured, but the rate varied from 70 to 50 to 28 at different times. He died quietly at 12 15 A.M. on August 20th.

A post-mortem examination was performed. An incision was made on to the head of the right humerus, which was *found in the* normal situation and without fracture. There was a small bony mass in one tendon near its insertion into the humerus, which must have caused the crepitus felt. On opening the right pleura air escaped from it with a rush. A small amount (about eight ounces or so) of slightly blood-*stained* fluid was found in the right pleura (being possibly the serum of the clotted blood). There was a large amount of clot adherent to the lung surface *and to the* parietal pleura; this clot gave one the impression of having air in it. The right lung itself was small, collapsed, fleshy, *airless*, with a tear of the middle lobe. There was no abnormal inflammation. The left lung was resonant, but blood had evidently been inspired into it, for a frothy bloody fluid escaped on section. There was a remarkable absence of compensatory emphysema, the lung being only *of about normal* volume. There was an old fibroid tuberculous patch at the apex of the left upper lobe. There was no evidence of pneumonia. The *pericardium contained* a very small amount of clear fluid. The heart showed some flabbiness of the right ventricle, TO ILLUSTRATE CASE IN DR. HAWTHORNE'S ADDRESS ON THE CEREBRAL AND OCULAR COMPLICATIONS OF ANÆMIA AND THE PROBABLE RELATIONSHIP OF THESE TO THROMBOSIS.

hydrate. This mixture is heated to from 55° to 60° C. on a water bath or in a thermostat for 24 or 36 hours.

Solution II., Eosin.—One gramme of eosin (Grubler's yellow shade, soluble in water) is dissolved in 5 cubic centimetres of absolute alcohol, then 95 cubic centimetres of distilled water are added.

To make up the stain.—Take 35 cubic centimetres of Solution I., add about 50 cubic centimetres of methyl alcohol (Merck) and shake well, then add 30 cubic centimetres of Solution II. and make up the total volume to 350 cubic centimetres with methyl alcohol. With some samples of methylene blue it is advisable to employ 40 cubic centimetres instead of 35 cubic centimetres of Solution I. The staining of a trial blood-film will indicate whether this is necessary, and, if so, the extra quantity of the blue solution may then be added. The stain thus produced may be used at once, neither filtration nor evaporation being necessary. The differentiating qualities are improved by incubation at 37° C. for 24 or 48 hours, care being exercised to retard evaporation of the alcohol by tightly plugging the flask or bottle with cotton wool. If contained in a well-stoppered vessel the fluid will keep for at least four months—probably much longer, and improves rather than deteriorates in staining properties.

The method of fixing and staining preparations is similar to that employed in Leishman's process—viz., first one minute in the undiluted solution, then three minutes after adding from two to four volumes of distilled water. If the films be then thoroughly irrigated for about 20 seconds with distilled water, by means of a wash-bottle, it is not necessary to allow the water to remain for a minute, as suggested by Leishman. With but little experience, clean and evenly stained preparations are produced.

One point in the technique that should be emphasised is as follows. When the staining is complete the excess of fluid must not be tipped off but, the slide being held horizontally, it must be flooded off with a jet of distilled water. For demonstrating the structure of trypanosomes and other blood parasites better results are obtained by prolonging the staining period to 10 or 20 minutes.

The stain may be reduced to the form of a powder by evaporating the solution to dryness at about 60° C. To make up the stain from this powder weigh up 0·3 gramme and mix with 10 cubic centimetres of distilled water. Allow this to macerate for five or ten minutes, then add methyl alcohol to 100 cubic centimetres. This solution may be used at once but is improved by standing for a day.

Reviews and Notices of Books.

The Principles and Practice of Modern Otology. By JOHN F. BARNHILL, M.D., Professor of Otology, Rhinology, and Laryngology, Indiana University, &c.; and ERNEST DE W. WALES, B.S., M.D., Associate Professor of Otology, Rhinology, and Laryngology, Indiana University, &c. With 305 Illustrations. London and Philadelphia: W. B. Saunders Company. Pp. 575. 1907. Price 24*s.* net.

IT is stated in the preface that the primary object which has been kept in view is to modernise the subject; secondly, to correct certain traditional beliefs, the principal one being that children outgrow their ailments; thirdly, to advocate the earliest possible prophylaxis or treatment; fourthly, to emphasise the importance of a thorough examination; and fifthly, thoroughly to illustrate the text. This is a large programme, and a work even as richly illustrated as this, unless its illustrations throw new light upon their subjects or disprove established views, will have difficulty in being of great value from a modernising point of view; and the author's aim is but partially achieved.

The first chapter, on the anatomy of the temporal bone, is certainly very complete and very well illustrated, but the physiology of the organ of hearing is summed up in five pages, commencing with the statement that "very little is actually known about the function of hearing; the physiology of the internal ear is wholly theoretic, and theory is but another name for ignorance." The third chapter, on the bacteriology of the ear, contains most of what is known up to the present time but we do not notice anything new. The fourth chapter is on the causation of diseases of the ear, while the next ten chapters are devoted to diseases of the external ear. The seventeenth chapter is devoted to the methods of examination of the patient, and here we find, as is not at all uncommon in modern text-books of this description, a reproduction of a photograph of a consulting room. In Chapter XVIII. we are told that "as a therapeutic measure Politzerisation holds a middle position between the Valsalva method and inflation by means of the catheter." This cannot be considered as at all a modern view, considering how universally Valsalva's method is condemned by modern otologists.

The section dealing with the examination of the function of the ear presents a fair description of the various tests and the evidence upon which the diagnosis should be made between middle-ear and labyrinthine deafness. The twenty-first chapter is on acute tubo-tympanic catarrh which is an excellent name for the condition more usually described as acute Eustachian obstruction; we feel that this title forms a definite advance in the right direction. In the succeeding chapter, which deals with acute catarrhal otitis media, which is after all but another stage of the preceding complaint, we notice a description which we have not seen before but which is, nevertheless, absolutely correct—namely, that the benefit of packing a discharging ear with dry gauze rests not so much in its antiseptic properties as in its syphon action. Acute mastoiditis, with its treatment, operative and otherwise, occupies the next chapter. There is only one criticism which we would make on the treatment of acute mastoiditis, which is to ask why the bowels should not be opened until the third or fourth day. Chapters XXIV. to XXX. deal with chronic suppurative otitis and contain amongst other illustrations several extremely good microphotographs, one of a much thickened tympanic membrane in this disease, and some very pertinent remarks are here made with regard to the influence of nasal and naso-pharyngeal trouble on this complaint. In discussing the various operations ossiculectomy is carefully described, and an angular knife is depicted which is used to divide the capsular ligament between the stapes and the incus, a refinement of operative technique which is as unnecessary as it is probably difficult. In the chapter on chronic mastoiditis there is a series of excellent illustrations showing many of the various conditions which occur. But here, in the description of the operation for chronic mastoiditis, which is otherwise most accurately written, the reader is warned against separating the whole of the external meatus from the bone without previously dividing it at its inner extremity if the ossicles are still present and attached to any remnant of the drum membrane, as otherwise the stapes might be torn from its position. This is a statement which is so obviously fallacious that we wonder how it could have found its way into the book. Intracranial complications are very well dealt with and some excellent diagrams and plates illustrating the subject are given, including a flap for exposing the temporo-sphenoidal and antral regions at the same time, which seems to us to be a very valuable one. On p. 465 there is a useful table to assist in the differential diagnosis between the various forms of intracranial lesions.

Chronic non-suppurative otitis media comes under one heading; no attempt is made at any differentiation between the various conditions found. In its treatment, if other and milder methods have failed, various operative procedures are suggested, amongst which complete ossiculectomy, including removal of the stapes, is recommended. The last chapters on diseases of the internal ear, including deaf-mutism, appear normal or may show nothing more than some fulness of the retinal veins. In the intermediate cases, that is, those in which papillitis and visual defect are both present, it may be surmised that thrombosis has involved both the vessels of the optic disc and also those of the nerve trunk. One further remark in connexion with these cases may be added. It does sometimes happen that a patient shows papillitis in each eye and in one or both eyes also a serious reduction of visual acuity. The latter fact, as already suggested, implies a lesion in the optic nerve trunk. Therefore when with double papillitis there is marked visual loss it seems probable that the thrombosis, assuming this to be the responsible lesion, is bilateral and peripheral, and further warrant for this view may be found in cases described as retrobulbar neuritis where the affection attacks both eyes, either simultaneously or in rapid succession. Thus there may be distinguished in anæmia two groups of cases in which bilateral papillitis (optic neuritis) is present. In one there is marked visual defect and here, for reasons just given, the probabilities are in favour of a bilateral peripheral lesion. In the other and more common variety there is little or no impairment of vision. In such circumstances it is sufficient to assume, as has already been suggested, a central or intracranial thrombosis, and the experience that with this order of neuritis more or less conspicuous clinical evidences of cerebral disturbance are sometimes present may be advanced in support of such an assumption. But in both groups, as well as in other cases in which optic neuritis and visual loss, either alone or in combination, are present, it may be submitted that thrombosis affords a possible explanation of the facts, and that by such explanation these cases are brought into a reasonable relationship with other cerebral and ocular conditions which occasionally manifest themselves in patients in whom, in spite of exact and continued clinical observation, nothing abnormal can be discovered other than a depreciated quality of the blood.

Such, then, in outline, are some of the cerebral and ocular complications[5] which may appear in the subjects of simple anæmia. It may perhaps be said that these accidents are very unusual. Still, they occur, and therefore demand explanation; and it is possible that in their slighter forms they would more frequently be discovered were examination made for them. Further, the infrequency of these complications is by no means out of harmony with the suggestion that they depend on thrombosis; as, however, it may be explained, thrombosis, although a potential development in all cases of anæmia, only on rare and unusual occasions takes shape and form as a definite clinical occurrence. If the view here advocated is accepted, the occasions of thrombosis are somewhat enlarged, but even so increased there is no desire to pretend that these occasions are either relatively or absolutely frequent. Whether few or many, however, it is to be desired that clinical events shall be duly arranged in their appropriate order and relationship. The hypothesis here advanced is an attempt in this direction. Assuming it to be justified, it brings under a common explanation a number of events which, apart from it, are isolated and detached alike from one another and from the state of anæmia to which, in some fashion or other, their existence is undoubtedly due. In the practical sphere, the suggestion that optic neuritis, ocular paralyses, hemianopsia or other abnormalities of the visual field, retinal embolism, and retrobulbar neuritis, occurring in anæmic patients, are probably due to thrombosis, is significant, because on such interpretation any one or more of these events appearing in an individual case must be accepted as the sign of a tendency to thrombosis in an unusually marked degree, and must therefore claim the prompt application of the therapeutic measures which such a conclusion demands.

---

[5] Hæmorrhages in the retina are occasionally seen in patients suffering from chlorosis and may possibly be either direct or secondary to thrombosis. They are quite exceptional, and even when present probably not more than one or two will be detected. In pernicious anæmia, on the other hand, multiple retinal hæmorrhages are the rule.

A RUSSIAN OTO-LARYNGOLOGICAL CONGRESS.—From Jan. 8th to 11th next the first all Russian Oto-Laryngological Congress will be held in the Pirogoff Museum. Advantage will be taken of the occasion to hold an exhibition of instruments, apparatus, &c., related to oto-rhino-laryngology.

THE MEDICAL ASPECT OF GASTRO-ENTEROSTOMY, BASED ON 128 OPERATIONS AT THE MANCHESTER ROYAL INFIRMARY.

BY E. B. LEECH, M.D. CANTAB., M.R.C.P. LOND.,
RESIDENT MEDICAL OFFICER AT THE MANCHESTER ROYAL INFIRMARY.

IN general hospitals there is a large class of cases of chronic gastric ulcer admitted to the medical wards, treated there for a few weeks, usually with immediate relief, and then dismissed with a certainty of recurrence, and this recurrence may even take the form of an acute perforation. An interest in this class of cases has led me to obtain permission from the surgeons of the Manchester Royal Infirmary to collect information concerning the after-history of their patients on whom gastro-enterostomy has been performed, for gastro-enterostomy is apparently the least dangerous and most efficient surgical means of treating many of these cases. I thought that by investigating, on the one hand, the previous sufferings, and, on the other hand, the operation results, good or bad, I might throw some light on the advisability of the operation in various circumstances.

It is, then, from the medical point of view rather than from the surgical that I have approached the subject, and though surgical questions have arisen I have not laid much stress on them. The question that has interested me is, Which are the cases of gastric trouble that the practitioner or physician should send to the surgeon for gastro-enterostomy? My object has been to learn what cases are suitable for operation rather than to decide how best to perform it. As but little extra labour was involved, my research was further extended to malignant as well as to non-malignant cases. I have been fortunate in tracing by letters and personal visits every one of the 128 cases of gastro-enterostomy performed in this hospital before the middle of 1907. My deductions being purely critical, in so much as I have had no direct interest in the operations, are free from personal bias. The standard by which I have judged the results has been a high one; the reports are given as far as possible in the actual words of the patients. Those cases alone are counted as cures where no persistent symptoms are mentioned by the patient.

STATEMENT OF CASES.

Of the 128 operations 79 were for non-malignant conditions, 46 were for malignant, while three have been excluded for reasons stated below. It must be remembered, however, that many of the operations were primarily exploratory, to decide whether the disease was malignant and, if so, to decide whether it was suitable for pylorectomy. In several instances where the patient's condition did not allow a thorough examination at the time of operation, time alone has decided the malignancy or otherwise of the case. The number of patients who have left hospital with a doubtful or wrong diagnosis is very striking; ten supposed malignant cases have shown themselves to be benign, and in three cases the opposite error has been made. For this reason any deductions involving a comparison of the success in malignant and non-malignant cases, and based on a sharp division to these two classes, may give a false impression.

The question of method of operation is so entirely in the surgeon's hands and is now so nearly settled in broad principle that I need only give a bare statement of the forms employed. The posterior anastomosis has been made in 74 non-malignant and in 33 malignant cases, the anterior in one and seven respectively; in ten there is no note as to the position of the opening. A partial gastrectomy has been performed in four cases, a gastroplasty in two cases, and an entero-enterostomy in two cases, but these figures do not include cases where any of these operations have been performed subsequently owing to failure of the original gastro-enterostomy. Murphy's button has been used twice, both times without giving relief. Robson's bobbin has been used in two cases in which relief ensued and in one case which died; Senn's plates have been used in one successful case.

Non-malignant cases.—These naturally form the most important group as the results may be permanent. The children are set forth. The second part of the book is in the form of a dictionary of treatment, alphabetically arranged. Illustrations are added where they are required. The individual articles are necessarily brief, but they are usually practical. We find, for example, that intubation is recommended in diphtheria as preferable to tracheotomy in hospital practice but not in private cases, in which constant supervision is impossible. The dosage of diphtherial antitoxin, however, is given in cubic centimetres, not in units—a mode of measurement which we can hardly commend. In enteric fever the regular administration of a saline purge every third day is advised by Bouchard, while Grancher relies on large doses of quinine, and the authors of the present work combine these modes of treatment. Tepid baths are used to reduce the fever. For hæmophilia the use of fresh animal serum both locally and hypodermically is said to be of great value. The book concludes with a number of prescriptions for various conditions and with a table of doses suitable for different ages. It affords a useful opportunity for comparing the practice in this country with that of our neighbours, containing as it does a very compact summary of the pædiatric procedures in vogue in France, and for this reason as well as for its general utility we commend this volume favourably to our readers.

Green's Encyclopædia and Dictionary of Medicine and Surgery. Vol. VIII: Physiology to Rhinolalia. London and Edinburgh: William Green and Sons. 1908. Pp. 588.

THIS Encyclopædia and Dictionary of Medicine and Surgery has now reached its eighth volume, and the articles in this instalment extend from Physiology (second part) to Rhinolalia. The second half of the monograph on Physiology, by Professor D. Noel Paton, occupies nearly 100 pages and includes a section dealing with the subject of hormones. The action of the hormones or "activators" yielded by the suprarenal bodies and other structures is well discussed and a good summary is given of the present knowledge on the subject. The thyroid gland and the parathyroids receive due attention and the conclusion arrived at by the author is that the nervous symptoms which follow ordinary thyroidectomy—the tremors, and so on—seem to be due to the loss of the parathyroids, while the metabolic changes are probably due to want of the internal secretion of the thyroid. Other important contributions to this volume are those on Pregnancy (in 11 sections), on the Puerperium (in six sections), and on Rheumatism (in four sections). Under the last-named heading are articles on rheumatism in children, rheumatoid arthritis, and chronic rheumatism. Dr. F. J. Poynton's remarks on acute rheumatism are well worthy of perusal. In discussing the "exciting cause" he expresses the opinion that one and not several different bacteria will prove to be the true excitant of this disease, but the peculiar poisons that are formed and the peculiar vital chemistry of the human tissues are as yet unknown. New articles have been added in which prescribing and methods of administering drugs are fully considered. A short communication also appears on the nature of radium and its physiological and therapeutical effects.

LIBRARY TABLE.

Archives of the Pathological Institute of the London Hospital (Sir Andrew Clark Memorial). Vol. I. London: Adlard and Son. 1908. Pp. 81.—This small volume contains 12 papers on various subjects by the workers in the pathological institute of the London Hospital and is a valuable record of good work. The first paper is by Dr. O. H. Miller, describing a case of chloroma which occurred in a child aged two years, the diagnosis having been made during life and being confirmed by necropsy. The case is of interest also in that a careful blood examination was made during life, showing a marked lymphocytosis of the large-celled type. Dr. Miller and Dr. J. B. Cleland contribute a short paper on two cases of primary carcinoma of the liver in infants. Two cases of syphilitic disease of the myocardium are recorded by Dr. Miller and Dr. R. A. Worthington. In both instances there was extensive interstitial fibrosis with gummatous deposit. The record of a case of splenomegalic polycythæmia, with an account of the necropsy, by Dr. R. Hutchison and Dr. Miller, has been reprinted from THE LANCET. A note on the condition of the large intestine in chronic lead poisoning by Dr. Worthington draws attention to the discolouration of the mucous membrane from the deposition of lead sulphide in the epithelial cells. The fact that this is limited to the large intestine is regarded as indicating that it possesses a special excretory (or absorptive) power with regard to lead. The same observer next records a case of dysenteric ulceration of the small intestine and another of acute perforating ulcer of the gall-bladder. A brief note on plasma cells in chronic staphylococcal abscess of the brain by Dr. Cleland follows. In a useful and instructive paper on Polioencephalitis Acuta, by Dr. J. Douglas O. White and Dr. Worthington, a typical case is described with necropsy and the microscopical appearances are detailed with great care and critically compared with those of acute anterior poliomyelitis. Dr. Miller contributes a preliminary report on the Histology of Gastric Ulcer, from which he concludes that the lymphoid tissue is a factor of great importance, that a gastric ulcer starts by the bursting of a lymphoid follicle, and that it is prevented from healing by the damage done to the vessels at the time of ulceration and by the fibrous condition of the basement membrane and submucous layer co-existing. A paper on Acute Hæmorrhagic Pancreatitis, by Dr. White, based chiefly upon seven cases observed at the London Hospital, is one of the most instructive in the book and affords a critical and suggestive contribution to the pathology of this interesting condition. The book concludes with the report of the Cancer Research scholar, Dr. Cleland. This paper contains a critical review of some of the recent work on the histology of malignant growths and of other aspects of the problems of cancer research.

The Treatment of Uterine Retro-deviations. By G. A. CASALIS, M.B., C.M. Edin., Gynæcological Surgeon to the Victoria Cottage Hospital, Wynberg. With 35 illustrations. Cape Town: T. Maskew Miller. 1906. Pp. 175.—This book is one of the first medical works to be published in South Africa. The author reviews very fully the treatment, both palliative and surgical, of uterine retro-deviations. He recommends that all such displacements producing definite symptoms should be treated. The plan of correcting a retroversion by the use of a sound or of a uterine repositor is condemned and the method of bimanual reposition, if necessary in the genu-pectoral position, is preferred. The chapter on the use of pessaries presents a clear account of these instruments but the impression conveyed to the reader is that Dr. Casalis is not really in favour of their use. He puts forward the theory that chronic uterine hyperplasia is a cause of the development of fibroid tumours of the uterus; hence the correction of uterine retro-deviations is of great importance so as to check any tendency to uterine congestion and the production of uterine hyperplasia. The second part of the book is devoted to a consideration of all the various surgical operations which have been devised for the purpose of treating these displacements of the uterus. The rules laid down for the correct choice of the particular operative procedure required are good and gastrostomy has recently been performed. In the other case of limited relief pain and vomiting have returned, though less severely than before operation.

Besides this last class, in some of which there is no obstruction to the passage of food, I wish to call attention to the other successful cases where there does not seem to have been stenosis in any part of the stomach. In one an ulcer was found at the cardiac end of the stomach (Class *f*), the pylorus being apparently free. In another no lesion at all could be found. Another (Class *i*) supposed at the time, owing to a hard mass felt, to be one of pancreatic growth, no lesion of the stomach was found. The continued relief of this patient after gastro-enterostomy shows that the diagnosis of malignancy was wrong but the method of relief is by no means clear. In another non-obstructive case there was less success. In spite of a history pointing to gastric ulcer nothing definite was found at the operation and the gastro-enterostomy which was done gave absolutely no relief. At a further operation the opening was closed and the stomach and gut were left in their original condition. There was no improvement at first, but three months later the patient suddenly improved and rapidly increased three stones in weight. I cannot explain this.

One of the two unsuccessful cases of the various class certainly now has locomotor ataxia with typical gastric crises. There probably was also an ulcer at the time of operation: the other patient of this class perhaps has the same disease.

The most unsuccessful class is that where simple dilatation of the stomach is present due to atonic gastritis combined with general weakness. All the three cases which I have put in this class died.

In order to obtain a general idea of the cause of failure in the non-malignant cases I have collected these causes and the forms in which the trouble persists in the following table, which includes all of the 16 cases in the "limited" and "no improvement" classes.

TABLE C.

Persistent pain	10 cases.
Vomiting (two with bile)	8 „
Locomotor ataxia...	2 „
Merycism	1 case.
Development of œsophageal obstruction	1 „

I next consider the fatal cases *en bloc*. The mortality class is unexpectedly large, but it is only fair to point out that it includes every case where death occurred within two months of the operation; this is a longer period than is usually taken in statistics of surgical results. The cases fall under two headings: (1) unsuitable cases; and (2) errors in operation. It is, however, difficult to divide them sharply. Under unsuitable cases I include not only those which were unsuitable from a mechanical point of view, but those where the patient was unable to withstand the shock owing to bodily weakness. The following 12 may be considered in the class of unsuitable cases, seven of syncope or gradual failure, two of broncho-pneumonia, one of cerebral thrombosis, one of abortion after operation with hæmorrhage, and one where the operation was performed fairly soon after corrosive poisoning; here a sharp kink was found post mortem in the duodenum. Six deaths may be classed as due to errors of operation. In one the jejunum was anastomosed to the pyloric half of an hour-glass stomach, in another the opening was made between the stomach and ileum, one died from pyæmia, another from general peritonitis, another with continual vomiting, and the last from gastric hæmorrhage.

The ages of the non-malignant cases operated on are of interest, for age itself seems to be no bar. Of the 79 cases 63 are below and 16 above 50 years of age. Of the 16 older cases 12 are in the relieved or nearly relieved classes; four are dead. The percentage of cures happens to be greater here over than under 50 years of age.

Malignant cases.—The success in these cases is shown by the following table:—

TABLE D.

	Number of cases.		Percentage.
Class 1. Living over two months; relief obtained	15	=	32
Class 2. Living over two months; no relief	10	=	22
Class 3. Dying in less than two months after operation	21	=	46

This shows that only 32 per cent. of operations have been "worth while" and that 68 per cent. (Classes 2 and 3) are failures. This contrasts with the non-malignant cases, where the figures are reversed, 68 per cent. being successful and 32 per cent. being failures. With regard to the position of the growth, I find that in these 46 cases it was in 40 at the pylorus either primarily or by invasion; in one it was on the lesser curvature, in two on the posterior wall; in one there was invasion of the stomach from a secondary growth of the liver; the primary growth in this case was in the breast. The situation of the growth was not stated in two cases, but in both it was widespread. It may be well first to dispose of the cases not at the pylorus. The patients with growths on the lesser curvature and posterior wall all died within a few days of operation and the woman with secondary pyloric growth obtained no relief. The 40 obstructive cases fall into the classes as follows: some relief in 18, no relief in nine, early death in 13. In the relief class the success in some of the cases is certainly striking, especially when we remember that each of them was not considered fit for a partial gastrostomy at the time of operation and that therefore the disease must have been well advanced. Six of the patients were able to work for a year. In other instances, where health was not restored sufficient for work, vomiting, in many patients the most distressing symptom, was relieved. A strange contrast of success and failure is seen in the case of a musician who had a palpable tumour, which was found at the operation to be a fairly advanced carcinoma. The relief from the gastro-enterostomy was so marked that he was able to resume his work and believed himself cured. While working he cleared off a debt which had accumulated during his previous illness and had the happiest year of his life. Then pain recurred, though the gastro-enterostomy opening apparently remained patent throughout. The medical practitioner who attended him writes that he finally had the most extraordinary period of agony he had ever seen in any patient, and says that in his opinion the operation was not worth while.

The no relief class, which has an average after life of six months, is the most unsatisfactory, for here the patient has the discomfort of an operation which, without relieving the symptoms, may even prolong life. The mortality-class, though unsatisfactory from the surgeon's point of view, is in other respects not so distressing, for the operation is often done at the patient's special request and life would have been little longer if the risk had not been taken.

The longest survival after gastro-enterostomy for malignant disease has been 30 months. There has been no increase in the number of malignant cases operated on in recent years. The figures stand at 11, 8, 9, and 5 (six months only) for the years 1904–7. The operation is evidently not increasing in favour.

Excluded cases.—I have excluded three cases from the above tables. In two the question of malignancy has not been settled; one died five months after leaving hospital from sudden gastric hæmorrhage; the other, who underwent operation in May, 1907, is still alive and comfortable. The third patient, supposed to have acute gastric trouble, was found at the operation to have a somewhat dilated stomach. A gastro-enterostomy was performed and the patient died the same day. The acute attack was really an incipient pneumonia.

Contrary to what might be expected, there has been no great improvement in results in later years. While the recent non-malignant cases have been slightly more successful, the recent malignant cases have been strikingly more fatal than the earlier cases. In the first half of the non-malignant cases 17 were completely successful and 10 died; while in the second half 20 were completely successful and eight died. In the malignant cases 11 of the earlier ones were successful and 12 unsuccessful, while in the later cases only four were successful and 19 were failures.

ADVISABILITY OF OPERATION.

The above figures may be taken as those of a hospital where the surgery is of a high type but where no attempt has been made to pick cases or to obtain figures for records and for publication. From these and from a general knowledge of the outlook in gastric ulcer and carcinoma I draw the following conclusions.

Malignant cases.—Any operation which has a mortality children are set forth. The second part of the book is in the form of a dictionary of treatment, alphabetically arranged. Illustrations are added where they are required. The individual articles are necessarily brief, but they are usually practical. We find, for example, that intubation is recommended in diphtheria as preferable to tracheotomy in hospital practice but not in private cases, in which constant supervision is impossible. The dosage of diphtherial antitoxin, however, is given in cubic centimetres, not in units—a mode of measurement which we can hardly commend. In enteric fever the regular administration of a saline purge every third day is advised by Bouchard, while Grancher relies on large doses of quinine, and the authors of the present work combine these modes of treatment. Tepid baths are used to reduce the fever. For hæmophilia the use of fresh animal serum both locally and hypodermically is said to be of great value. The book concludes with a number of prescriptions for various conditions and with a table of doses suitable for different ages. It affords a useful opportunity for comparing the practice in this country with that of our neighbours, containing as it does a very compact summary of the pædiatric procedures in vogue in France, and for this reason as well as for its general utility we commend this volume favourably to our readers.

Green's Encyclopædia and Dictionary of Medicine and Surgery. Vol. VIII: Physiology to Rhinolalia. London and Edinburgh: William Green and Sons. 1908. Pp. 588.

THIS Encyclopædia and Dictionary of Medicine and Surgery has now reached its eighth volume, and the articles in this instalment extend from Physiology (second part) to Rhinolalia. The second half of the monograph on Physiology, by Professor D. Noel Paton, occupies nearly 100 pages and includes a section dealing with the subject of hormones. The action of the hormones or "activators" yielded by the suprarenal bodies and other structures is well discussed and a good summary is given of the present knowledge on the subject. The thyroid gland and the parathyroids receive due attention and the conclusion arrived at by the author is that the nervous symptoms which follow ordinary thyroidectomy—the tremors, and so on—seem to be due to the loss of the parathyroids, while the metabolic changes are probably due to want of the internal secretion of the thyroid. Other important contributions to this volume are those on Pregnancy (in 11 sections), on the Puerperium (in six sections), and on Rheumatism (in four sections). Under the last-named heading are articles on rheumatism in children, rheumatoid arthritis, and chronic rheumatism. Dr. F. J. Poynton's remarks on acute rheumatism are well worthy of perusal. In discussing the "exciting cause" he expresses the opinion that one and not several different bacteria will prove to be the true excitant of this disease, but the peculiar poisons that are formed and the peculiar vital chemistry of the human tissues are as yet unknown. New articles have been added in which prescribing and methods of administering drugs are fully considered. A short communication also appears on the nature of radium and its physiological and therapeutical effects.

LIBRARY TABLE.

Archives of the Pathological Institute of the London Hospital (Sir Andrew Clark Memorial). Vol. I. London: Adlard and Son. 1908. Pp. 81.—This small volume contains 12 papers on various subjects by the workers in the pathological institute of the London Hospital and is a valuable record of good work. The first paper is by Dr. C. H. Miller, describing a case of chloroma which occurred in a child aged two years, the diagnosis having been made during life and being confirmed by necropsy. The case is of interest also in that a careful blood examination was made during life, showing a marked lymphocytosis of the large-celled type. Dr. Miller and Dr. J. B. Cleland contribute a short paper on two cases of primary carcinoma of the liver in infants. Two cases of syphilitic disease of the myocardium are recorded by Dr. Miller and Dr. R. A. Worthington. In both instances there was extensive interstitial fibrosis with gummatous deposit. The record of a case of splenomegalic polycythæmia, with an account of the necropsy, by Dr. R. Hutchison and Dr. Miller, has been reprinted from THE LANCET. A note on the condition of the large intestine in chronic lead poisoning by Dr. Worthington draws attention to the discolouration of the mucous membrane from the deposition of lead sulphide in the epithelial cells. The fact that this is limited to the large intestine is regarded as indicating that it possesses a special excretory (or absorptive) power with regard to lead. The same observer next records a case of dysenteric ulceration of the small intestine and another of acute perforating ulcer of the gall-bladder. A brief note on plasma cells in chronic staphylococcal abscess of the brain by Dr. Cleland follows. In a useful and instructive paper on Polioencephalitis Acuta, by Dr. J. Douglas C. White and Dr. Worthington, a typical case is described with necropsy and the microscopical appearances are detailed with great care and critically compared with those of acute anterior poliomyelitis. Dr. Miller contributes a preliminary report on the Histology of Gastric Ulcer, from which he concludes that the lymphoid tissue is a factor of great importance, that a gastric ulcer starts by the bursting of a lymphoid follicle, and that it is prevented from healing by the damage done to the vessels at the time of ulceration and by the fibrous condition of the basement membrane and submucous layer co-existing. A paper on Acute Hæmorrhagic Pancreatitis, by Dr. White, based chiefly upon seven cases observed at the London Hospital, is one of the most instructive in the book and affords a critical and suggestive contribution to the pathology of this interesting condition. The book concludes with the report of the Cancer Research scholar, Dr. Cleland. This paper contains a critical review of some of the recent work on the histology of malignant growths and of other aspects of the problems of cancer research.

The Treatment of Uterine Retro-deviations. By G. A. CASALIS, M.B., C.M. Edin., Gynæcological Surgeon to the Victoria Cottage Hospital, Wynberg. With 35 illustrations. Cape Town: T. Maskew Miller. 1906. Pp. 175.—This book is one of the first medical works to be published in South Africa. The author reviews very fully the treatment, both palliative and surgical, of uterine retro-deviations. He recommends that all such displacements producing definite symptoms should be treated. The plan of correcting a retroversion by the use of a sound or of a uterine repositor is condemned and the method of bimanual reposition, if necessary in the genu-pectoral position, is preferred. The chapter on the use of pessaries presents a clear account of these instruments but the impression conveyed to the reader is that Dr. Casalis is not really in favour of their use. He puts forward the theory that chronic uterine hyperplasia is a cause of the development of fibroid tumours of the uterus; hence the correction of uterine retro-deviations is of great importance so as to check any tendency to uterine congestion and the production of uterine hyperplasia. The second part of the book is devoted to a consideration of all the various surgical operations which have been devised for the purpose of treating these displacements of the uterus. The rules laid down for the correct choice of the particular operative procedure required are good and intelligently. Evidently irritated by the chimes of the neighbouring cathedral, he said repeatedly, "I want it disconnected," but could not explain what "it" was. He could not recognise objects handed to him or in the room—at any rate he could not name them. He was able to read aloud from a book but could not repeat consecutively more than three or four words dictated to him. He could not carry out any commands spoken or written.

It will be seen that the signs of pressure widely affecting the left hemisphere were unequivocal, but it was difficult to arrive at any decided opinion as to the precise agent causing the pressure. The long period that had elapsed since the accident, the readiness with which the wound had healed, and the absence of any adhesion of the cicatrix to the bone, or other indication of the bone having suffered damage, and the freedom of the patient from any sign of septic infection, all weighed against the presence of pus. As there had been no sign of compression closely following the injury, and as the case only reached a somewhat abrupt climax three months afterwards, it was not easy to interpret the condition as arising from a hæmorrhage the direct consequence of the accident. The possibility of a gross lesion in the form of a tumour was kept in mind, but the only thing which lent any support to this solution was some vague information as to a deterioration of health and an ill-defined change in the patient previous to the injury. In this case the occurrence of the accident had to be accepted as merely a coincidence. But whatever might prove to be the cause of the pressure the necessity of an exploratory trephining was clear.

The operation was carried out on Nov. 14th. The posterior parietal region was laid bare by a large flap reflected downwards. The cicatrix of the wound was included in the upper and posterior angle of the flap and the underlying bone showed no trace of injury. Three trephine discs were then removed and the intervening piece of bone was cut out with a guarded Gigli saw, so as to expose the upper Rolandic area. The exposed dura mater bulged and looked bluish, and when it was incised a quantity of porter-like fluid gushed out to the estimated amount of five or six ounces. When the exposed dura mater was fully laid open a large cavity extending downwards and forwards and loosely occupied with blood clot came into view. Many portions of the clot were adherent to the under surface of the dura mater (parietal arachnoid); none of the clot adhered to the visceral arachnoid. These adherent portions were scraped away with the sharp spoon and while this was being done it was noticed that the surface of the depressed hemisphere was slowly rising. In no long time it had risen to the normal level. A gauze drain was placed in the subdural space to prevent re-accumulation of fluid and the operation was finished with the suture of the dura mater and the re-adjustment of the scalp flap. The bone was not replaced.

When the patient was visited by Dr. Plummer in the evening he could answer the ordinary questions correctly; he could move the right leg and to a slight extent the right arm. Day by day thereafter there was a progressive recovery of function. The mental faculties were fully restored, as well as the power of speech and the use of the arm and leg. After a visit to Las Palmas to recuperate his general health he returned to the full discharge of his duties.

The best account of such cases as the foregoing is to be found in an early contribution on "Extravasations of Blood into the Cavity of the Arachnoid," by Prescott Hewett,[2] and in the treatise on Injuries of the Head by the same author in Holmes's "System of Surgery." In the first of these contributions which deals with the pathology of the subject Hewett establishes the frequency of hæmorrhage into the subdural space, and traces the changes which the effused blood may undergo. He shows that these changes are not the result of inflammation; that they begin with the coagulation of the blood and with the natural tendency to the formation of an adventitious membrane encapsuling the clot. Such an encapsuled clot adheres readily to a surface with which it rests in contact—in this instance to the arachnoid surface of the dura mater. Adhesion is speedily followed by organisation through the agency of newly formed blood-vessels which penetrate the adventitious capsule and serve to bind it more intimately to the surface to which it adheres. But these new vessels are fragile and easily ruptured and this fact gives the key to such cases as that under consideration. A hæmorrhage in the first instance may be so slight that the subject of it suffers only a passing disablement. When the resulting clot is becoming organised an incidental rupture of newly formed blood-vessels takes place and a fresh hæmorrhage occurs; and this sequence once started may repeat itself indefinitely. It follows that a hæmorrhage originally small in amount may in the end lead to fatal compression. It resembles an ingravescent apoplexy, only occupying weeks or months in attaining its full development; and the course of the case may be marked by alternations of aggravation and improvement, the first caused by renewal of the hæmorrhage, the latter by absorption of the fluid part of the exudate. Similar pathological changes and an analogous clinical course have been observed in subdural hæmorrhage of idiopathic origin. Such cases are most apt to occur in the insane, the alcoholic, and the phthisical, and these have been the subject of communications in the volumes of the Transactions of the Pathological Society, by Greenfield,[3] Wynne,[4] Newton Pitt,[5] and others.

Returning to the clinical aspects of the subject as dealt with by Prescott Hewett in his treatise on head injuries we find some points which are pertinent to the present history. He points out that "there are no symptoms which will enable us clearly to diagnose an extravasation of blood into the cavity of the arachnoid." Especially is this the case, in his view, with regard to the possibility of discriminating between a hæmorrhage into the cavity of the arachnoid and a collection upon the outer surface of the dura mater. And it illustrates the then position of intracranial surgery that it should be assumed that only under the supposition of the blood being outside the dura mater would the surgeon be led to apply the trephine. For Hewett goes on to say, "Supposing the trephine to have been applied and no blood found between the bone and the dura mater, still the blood in the arachnoid may chance to lie immediately under the spot, and the dura mater of a blue colour may bulge into the trephine hole. Under such circumstances blood in the cavity of the arachnoid has several times been let out and the patient saved." And he adds, "When, however, there are no indications of the blood in the arachnoid being under the trephine hole there is nothing to justify the surgeon in proceeding further." These sentences are of interest in that they depict the attitude of the surgeon towards the dura mater at the time they were written. They show that the surgeon abstained whenever possible from opening the dura mater just as he preferred not to open the peritoneal sac in operating for strangulated hernia. Since then the risks have been almost abolished and as in other departments of surgery intracranial operations frankly undertaken for exploration, frequently issue in the complete restoration of the patient.

Newcastle-on-Tyne.

A CASE OF SLEEPING SICKNESS TREATED WITH ATOXYL; APPARENT RECOVERY.

BY T. ARNOLD JOHNSTON, M.B., CH.B. EDIN.,
CLINICAL ASSISTANT AT THE ROYAL INFIRMARY, EDINBURGH; LATE HOUSE PHYSICIAN, ROYAL INFIRMARY, BRADFORD, YORKS.

THE following is an account of a case of sleeping sickness; it was first seen during the second stage of lethargy, tremors, and general glandular enlargement, developing later the emaciation and subnormal temperature, with aggravation of the former symptoms, which herald the third and usually fatal stage. This patient, subsequent to a rigid course of atoxyl and mercury treatment, as recommended by Nierenstein, regained full physical and mental health.

The patient was admitted to the Bradford Royal Infirmary, under the care of Dr. H. J. Campbell, on Sept. 7th, 1907. He had resided for three years in Fernando Po and on the Gold Coast and returned to England in April, 1907. He had always been a healthy man until his return from West Africa. There was no history of tubercle or syphilis, his wife being healthy, no miscarriages. and the mother of two healthy children, aged three and four years respectively. At the time of his return he complained of general malaise, individually. In the dermatological section Dr. E. G. Graham Little contributes a careful study of Granuloma Annulare, in which he groups under a single heading a series of cases which have been described under varying titles by different observers. In the laryngological section Dr. P. Watson Williams reports a remarkably successful external osteoplastic operation in a case of Malignant Growth of the Septum and Naso-pharynx. Amongst many other interesting cases may be mentioned one of hysteria with very unusual laryngeal manifestations, reported by Sir Felix Semon, and another of probable combination of laryngeal tuberculosis and syphilis by the same observer. In the medical section Dr. A. M. Gossage contributes a paper on the Tone of Cardiac Muscle, illustrated by many tracings, which embodies some original conceptions and includes observations upon dilatation, the extra-systole, and the action of digitalis. The neurological section is occupied with cases reported by Dr. H. G. Turney, Dr. G. Ogilvie, Dr. H. Campbell Thomson, Dr. Wilfred Harris, Dr. Leonard G. Guthrie, Dr. D. W. Carmalt-Jones, and others. The obstetrical and gynæcological section also contains several case reports, including one by Dr. Cuthbert Lockyer on Pregnancy in the Wall of a Tubal Sac. Dr. J. H. Teacher contributes, in conjunction with Dr. T. H. Bryce, an abstract of the Descriptive Part of a Memoir on the Examination of a Human Ovum of the probable age of 13 to 14 days. In the odontological section Mr. Arthur H. Evans contributes a case of Diffuse Fibromata of the Gums. The otological section includes cases and specimens recorded by Dr. P. McBride, Dr. A. Logan Turner, Mr. H. Wade, Dr. W. Permewan, Dr. J. M. Darling, and others, whilst the surgical section is concerned with an account of the reduction of an old subcoracoid dislocation of the humerus by excavating the glenoid cavity through a posterior intermuscular incision by Mr. W. G. Spencer; notes on cases of Cystic Tumour of the Suprarenal Body, including one recorded by Greiselius of Vienna in 1670, by Mr. A. H. G. Doran; and two difficult cases of fracture by Mr. Rushton Parker.

MEDICINE AND THE LAW.

"Dairying" in a Stable.

THE health authorities at Hastings are to be congratulated upon being successful in not only putting an end to a serious fraud that was being perpetrated upon the inhabitants of that town, but in bringing before the justices the perpetrators after they had only been operating for a space of three weeks. Two men, George Cooper and Henry Dagnell, between August 13th and Sept. 5th, purchased from retail premises at Hastings no fewer than 654 pounds of margarine in small quantities at a time. They took their purchases to a stable which they had hired and here they made the margarine up into half-pound pats (with scales which were three-quarters of an ounce against the purchaser), afterwards hawking it round the town as genuine "Devonshire" butter. Their story was that they had just come from the country with the "butter" and their general attire was quite consistent with this statement. But purchases came to be made for the purpose of analysis, and the result was that the so-called "Devonshire butter" was found to be nothing more nor less than margarine. A warrant was secured for the arrest of the two men, and within a very few hours both men were sentenced to three months' hard labour without the option of a fine for obtaining money by false pretences. It is such sentences as these that are needed in cases of gross fraud where foodstuffs are concerned, and the justices, no doubt, were influenced by the aggravating circumstances in the case. The margarine was kept and "prepared" for sale in a stable which was actually being used as such, a pony being in the stall and manure lying about the floor at the time of the inspector's visit. To have proceeded against these men by summons would probably have resulted in them not being found, the pony and cart at the stable being quite capable of carrying them and their "dairying" utensils on to some other town where the same nefarious business might be carried on, and, perhaps, for a longer period than at Hastings.

Reform in Expert Medical Evidence.[1]

The Massachusetts Medical Society is endeavouring to procure legislation to bring about a change in the present conditions of medical expert testimony in the United States. Apart from the possible combination of unworthy lawyers and unworthy medical men, examples of which have been furnished in America, there is often witnessed the sorry spectacle of honest and reputable physicians arrayed on opposite sides in a law court and made to appear to give sworn opinions in quite conflicting manners concerning subjects upon which but one view would exist were the proceedings conducted by a private consultation among the witnesses. A distinguished judge in Massachusetts is reported to have observed lately: "If there is any kind of testimony that is not only of no value, but even worse than that, it is in my judgment that of the medical expert." To ameliorate this state of affairs it is suggested to enact that the court may on its own motion and at the request of either of the contending parties appoint one or more medical witnesses of approved training and experience to give expert testimony on any case under consideration. The Bill suggested proposes that such a report shall be considered legally as similar to that given to the report of an auditor. In furtherance of this plan it is proposed that the leading medical societies should furnish the Chief Justice of the Supreme Court with a panel of 50 medical men of high professional standing from whom may be selected expert witnesses with the designation of the specialty in which each is deemed to be an authority. Reasonable compensation for services so rendered are to be allowed by the court and paid from the county funds. The appointment of these official witnesses by the court is not to preclude the testimony of other skilled witnesses who may be called privately. The passage of such a measure by the legislature would revolutionise the present undesirable conditions under which expert evidence is produced; the medical expert would then be what his designation implies and would cease from being merely a medical advocate. The Bill is said to have the cordial endorsement of the best element of the legal and medical professions in the State of Massachusetts.

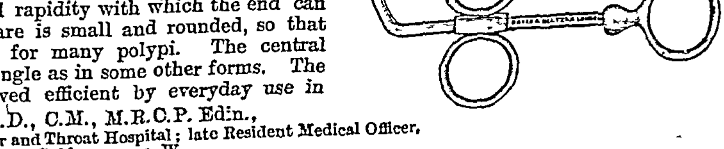
[1] A motion for reform carried by medical men in Boston was reported in THE LANCET of June 6th, 1908, p. 1651.

New Inventions.

A NASAL SNARE.



THIS snare has been made for me by Messrs. Mayer and Meltzer, 71, Great Portland-street, London, W. The chief feature is the ease and rapidity with which the end can be threaded with wire. The point of the snare is small and rounded, so that the wire retains its loop and can be used for many polypi. The central od is drawn straight back instead of over an angle as in some other forms. The snare is light and strong and has been proved efficient by everyday use in hospital.

WILFRID GLEGG, M.D., C.M., M.R.C.P. Edin.,
Assistant Surgeon to the Birmingham Ear and Throat Hospital; late Resident Medical Officer,
Throat Hospital, Golden-square, W.
Birmingham.

intelligently. Evidently irritated by the chimes of the neighbouring cathedral, he said repeatedly, "I want it disconnected," but could not explain what "it" was. He could not recognise objects handed to him or in the room—at any rate he could not name them. He was able to read aloud from a book but could not repeat consecutively more than three or four words dictated to him. He could not carry out any commands spoken or written.

It will be seen that the signs of pressure widely affecting the left hemisphere were unequivocal, but it was difficult to arrive at any decided opinion as to the precise agent causing the pressure. The long period that had elapsed since the accident, the readiness with which the wound had healed, and the absence of any adhesion of the cicatrix to the bone, or other indication of the bone having suffered damage, and the freedom of the patient from any sign of septic infection, all weighed against the presence of pus. As there had been no sign of compression closely following the injury, and as the case only reached a somewhat abrupt climax three months afterwards, it was not easy to interpret the condition as arising from a hæmorrhage the direct consequence of the accident. The possibility of a gross lesion in the form of a tumour was kept in mind, but the only thing which lent any support to this solution was some vague information as to a deterioration of health and an ill-defined change in the patient previous to the injury. In this case the occurrence of the accident had to be accepted as merely a coincidence. But whatever might prove to be the cause of the pressure the necessity of an exploratory trephining was clear.

The operation was carried out on Nov. 14th. The posterior parietal region was laid bare by a large flap reflected downwards. The cicatrix of the wound was included in the upper and posterior angle of the flap and the underlying bone showed no trace of injury. Three trephine discs were then removed and the intervening piece of bone was cut out with a guarded Gigli saw, so as to expose the upper Rolandic area. The exposed dura mater bulged and looked bluish, and when it was incised a quantity of porter-like fluid gushed out to the estimated amount of five or six ounces. When the exposed dura mater was fully laid open a large cavity extending downwards and forwards and loosely occupied with blood clot came into view. Many portions of the clot were adherent to the under surface of the dura mater (parietal arachnoid); none of the clot adhered to the visceral arachnoid. These adherent portions were scraped away with the sharp spoon and while this was being done it was noticed that the surface of the depressed hemisphere was slowly rising. In no long time it had risen to the normal level. A gauze drain was placed in the subdural space to prevent re-accumulation of fluid and the operation was finished with the suture of the dura mater and the re-adjustment of the scalp flap. The bone was not replaced.

When the patient was visited by Dr. Plummer in the evening he could answer the ordinary questions correctly; he could move the right leg and to a slight extent the right arm. Day by day thereafter there was a progressive recovery of function. The mental faculties were fully restored, as well as the power of speech and the use of the arm and leg. After a visit to Las Palmas to recuperate his general health he returned to the full discharge of his duties.

The best account of such cases as the foregoing is to be found in an early contribution on "Extravasations of Blood into the Cavity of the Arachnoid," by Prescott Hewett,[2] and in the treatise on Injuries of the Head by the same author in Holmes's "System of Surgery." In the first of these contributions which deals with the pathology of the subject Hewett establishes the frequency of hæmorrhage into the subdural space, and traces the changes which the effused blood may undergo. He shows that these changes are not the result of inflammation; that they begin with the coagulation of the blood and with the natural tendency to the formation of an adventitious membrane encapsuling the clot. Such an encapsuled clot adheres readily to a surface with which it rests in contact—in this instance to the arachnoid surface of the dura mater. Adhesion is speedily followed by organisation through the agency of newly formed blood-vessels which penetrate the adventitious capsule and serve to bind it more intimately to the surface to which it adheres. But these new vessels are fragile and easily ruptured and this fact gives the key to such cases as that under consideration. A hæmorrhage in the first instance may be so slight that the subject of it suffers only a passing disablement. When the resulting clot is becoming organised an incidental rupture of newly formed blood-vessels takes place and a fresh hæmorrhage occurs; and this sequence once started may repeat itself indefinitely. It follows that a hæmorrhage originally small in amount may in the end lead to fatal compression. It resembles an ingravescent apoplexy, only occupying weeks or months in attaining its full development; and the course of the case may be marked by alternations of aggravation and improvement, the first caused by renewal of the hæmorrhage, the latter by absorption of the fluid part of the exudate. Since then the risks have been almost abolished and as in other departments of surgery intracranial operations frankly undertaken for exploration, frequently issue in the complete restoration of the patient.

Newcastle-on-Tyne.

A CASE OF SLEEPING SICKNESS TREATED WITH ATOXYL; APPARENT RECOVERY.

By T. ARNOLD JOHNSTON, M.B., Ch.B. Edin.,
CLINICAL ASSISTANT AT THE ROYAL INFIRMARY, EDINBURGH; LATE HOUSE PHYSICIAN, ROYAL INFIRMARY, BRADFORD, YORKS.

THE following is an account of a case of sleeping sickness; it was first seen during the second stage of lethargy, tremors, and general glandular enlargement, developing later the emaciation and subnormal temperature, with aggravation of the former symptoms, which herald the third and usually fatal stage. This patient, subsequent to a rigid course of atoxyl and mercury treatment, as recommended by Nierenstein, regained full physical and mental health.

The patient was admitted to the Bradford Royal Infirmary, under the care of Dr. H. J. Campbell, on Sept. 7th, 1907. He had resided for three years in Fernando Po and on the Gold Coast and returned to England in April, 1907. He had always been a healthy man until his return from West Africa. There was no history of tubercle or syphilis, his wife being healthy, no miscarriages, and the mother of two healthy children, aged three and four years respectively. At the time of his return he complained of general malaise, valuable and interesting study of Huntington's chorea. A brief biographical sketch illustrated with two portraits is given of Dr. HUNTINGTON who happily is still living and engaged in general practice. He is of English ancestry, being descended from SIMON HUNTINGTON who left Norwich in 1633. He has also had the advantage of a medical heredity, his father and grandfather both having practised medicine in Easthampton, Long Island, at which place Dr. HUNTINGTON, after qualification in 1871, joined his father in practice. Many of the families in this district were of old New England stock and among them intermarriage was not infrequent owing to the comparative seclusion in which they had lived. Among these families there existed a hereditary disease, which formed the subject of Dr. HUNTINGTON'S paper. The condition had been recognised by his grandfather, Dr. ABEL HUNTINGTON, and the cases had been classified by his father, Dr. GEORGE LEE HUNTINGTON, and the manuscript of the original paper was carefully revised by the latter. In the pamphlet to which we have referred a reprint is given of this original description, and it has been well described by Professor W. OSLER as "the really graphic account he has given in a few paragraphs of the salient features of the disease." In this paper stress was laid upon three points in connexion with it—namely, its hereditary character ("an heirloom from generations away back in the dim past"), the associated tendency to insanity and suicide, and the fact that it only manifests itself as a grave disease in adult life—usually between the ages of 30 and 40 years. In connexion with the manner of its hereditary transmission the peculiar fact was brought out that if a generation in one of the affected families escapes the disease the thread is broken and the subsequent offspring remain free from it. The late period at which the disease, although obviously hereditary, appears was also mentioned as a striking feature when compared with most other diseases which are transmitted hereditarily, where the taint usually makes itself apparent at a more or less early age.

[3] Transactions of the Pathological Society, vol. xxix., 1878.

[4] Ibid., vol. xliii., 1892.

[5] Ibid., vol. xliii.

A number of papers written specially for this "HUNTINGTON Number" by various authorities are included. The first of these is in German and is contributed by Professor ADOLF STRÜMPELL of Breslau, who gives his experience of the disease in Germany. He states that the condition is one of great rarity in that country and that he has only seen about half a dozen cases. He gives brief details of two of these which have been seen by him at Breslau and refers to a third patient in whom the early movements were mistaken for mannerisms but who eventually became insane. Professor STRÜMPELL in this connexion lays stress upon the peculiar associated movements, such as grimaces, gesticulations, and bizarre gestures, which occur in addition to the actual choreic twitches. He also mentions a condition of hypotonus analogous to that observable in Sydenham's chorea. A paper in French is contributed by M. LANNOIS and M. PAVIOT on "The Nature of the Histological Lesion in Huntington's Chorea," in which some interesting observations are recorded concerning the pathology of the disease. The post-mortem appearances observed in a case of Huntington's chorea are described and the results of the histological examination of the brain by means of Nissl's method are detailed. It was found that the zone of the nerve cells of the motor region of the cortex was thickly studded with small blue granules, some of them appearing to be on a plane superficial to that of the nerve cells. Under the high power these granules could be differentiated from the neuroglia cells by their smaller size and by their staining reactions. Often three or four might be seen around a single nerve cell, some of them appearing to penetrate the protoplasm. This appearance is due, however, to their being on a different plane to the cell. The nerve cells themselves were found to present a condition of diffuse chromatolysis; their nuclei were often indistinct, the nucleolus alone being apparent. A similar infiltration with these granules was found about the cells of the basal ganglia. In a previous paper[3] M. LANNOIS and M. PAVIOT have expressed the opinion that these appearances are a result of a hereditary malformation of the neuroglia of the cerebral cortex. Since then, however, they have observed similar appearances in other conditions, including myoclonus, and they now suggest that these conditions are due to a chronic encephalitis or meningo-encephalitis producing lesions which are irritative rather than destructive, and they suggest that the hereditary factor in Huntington's chorea consists in a vulnerability of the cortex, or a predisposition to chronic encephalitis after an infection or an intoxication. Dr. A. R. DIEFENDORF of Yale gives an interesting study of the mental symptoms of the disease, the result of the personal observation of 14 cases and the analysis of the history of 14 others supplied to him by physicians and relatives. He divides the mental symptoms into three groups—cases with "gradually progressive dementia; cases with crazy symptoms; and cases with symptoms of congenitally defective constitution." He states further that the second and third of these are usually only "episodes in a psychosis which sooner or later ends in a progressive dementia."

The remaining papers are mostly devoted to the history of the subject. As so frequently happens in regard to the descriptions of newly recognised diseases, the priority of Dr. HUNTINGTON'S observations has been called in question, and it is now generally recognised that the disease had been described by three observers before 1872, the year in which his own paper appeared.[4] The first description which can be traced is that of the Rev. C. O. WATERS, M.D., of Franklin, Delaware County, New York. He appears to have been a man of varied interests and activities and to have left the practice of medicine for that of the Presbyterian ministry. His only contribution to the subject was a letter written to Dr. DUNGLISON and published in his "Practice" in 1842, in which the onset in later life, the hereditary character, and the incurability of the malady were described. The second description was given by Dr. C. R. GORMAN in an inaugural dissertation presented to the Faculty of the *Jefferson* Medical College of Philadelphia in 1848 and referred to in the third edition of DUNGLISON'S "Practice." The dissertation weight had gone down to 5 stones 3 pounds. The temperature was 97° and the pulse was 96. On the 16th the second course of injections was commenced. From this date we employed half the former dosage. During the night the patient was very collapsed and 5 minims of strychnine were injected every three hours. On the next day the patient was so collapsed that his wife, who was with him, came to the sister of the ward and reported her husband as having died. The crossing of the knee-jerks had disappeared; the other reflexes were less active. On the 28th the third course was commenced. The patient was extremely weak and emaciated, his weight being 4 stones 13 pounds. He cried and moaned piteously when being attended to. Retention of urine had again occurred several times and the catheter had been required. The temperature was 97·6° and the pulse was 92. On Nov. 12th the patient had improved. He was brighter and took a little interest in his surroundings. The bedsores were healing; the glands were smaller; the tremors were less frequent. Continence was definitely re-established on this date. Mental effort continued to be difficult and replies were delayed. His weight was 5 stones 2 pounds. On the 16th the fourth course of injections was commenced. Progress continued. On the 29th the fifth course of injections was commenced. There was continued steady improvement, the tremors had ceased, the glands were steadily decreasing, the sores had healed, and lethargy was gradually getting less. He had been wheeled about the ward in an invalid chair during the past week. His weight had risen to 6 stones. The temperature was 93 and the pulse was 88.° On Dec. 14th the sixth course of injections was begun. The progress was steady towards recovery. The glands were almost impalpable; the skin was smooth and healthy. Replies were a little delayed but he could do simple problems in arithmetic correctly. He read a little and could play dominoes with the other patients; he was soon tired with these efforts and slept a good deal. The temperature had risen to normal with an occasional evening rise to 99°. His weight was 6 stones 10 pounds. On Jan. 4th, 1908, the seventh and last course of injections was commenced. The patient was alert and intelligent when questioned, giving a clear account of his African experiences; his weight was now 7 stones 9 pounds.

[4] Medical and Surgical Reporter, Philadelphia, April 13th, 1872.

From this period till his departure to the convalescent home on Feb. 13th, the patient's condition steadily improved. All traces of glandular enlargement had *disappeared*, including the interscapular dulness; his reflexes were normal; no tremor was shown. During the day he went long walks and assisted in the work of the ward, his appetite was good, and his sleep at night was sound and refreshing. His weight went steadily up to 8 stones 7 pounds. In every way he was an impressive contrast to the emaciated wreck covered with sores and shaken by tremors of three months previously. During the last month he took cod-liver oil, quinine, and iron, no further injections being given. He was warned to report immediately any relapse to his medical adviser, but so far he has not returned to the hospital.

It only remains to express my deep obligations to Dr. Campbell for the freedom he allowed me in making the above observations; for these and other courtesies innumerable, while I had the privilege of being his house physician, I am more than grateful.

WARSAW UNIVERSITY.—The Warsaw correspondent of the *Times* states that the University, which has been closed since 1905, was opened on Sept. 14th. Of the 600 students who have entered only 38 are Poles, the rest being Russians and Jews. This is due to the fact that the Government refused to allow the University to be "polonised," and the Poles thereupon resolved to boycott it.

AN UNUSUAL TYPE OF LEUKÆMIA COMPLICATED BY SYNOVITIS IN A YOUTH THE SUBJECT OF ICHTHYOSIS.

BY RUPERT WATERHOUSE, M.D. LOND., M.R.C.P. LOND.,
HONORARY PATHOLOGIST AND ASSISTANT PHYSICIAN TO THE ROYAL UNITED HOSPITAL, BATH.

OUR knowledge of the causation of the various conditions comprised under the respective terms leukæmia and pernicious anæmia and of the relation of these affections to one another is so *unsatisfactory that little apology is needed for* recording at some length a case which serves to illustrate this relationship and at the same time presents other points of interest which may perhaps have a bearing on our conception of these diseases and of their possible connexion with infective processes on the one hand or with malignant disease on the other. Between a well-marked case of idiopathic pernicious anæmia with great diversity in form and size of erythrocytes, great diminution in their number, high colour index, presence of nucleated red cells, and diminution in the number of leucocytes in the blood and a case of lymphatic leukæmia with anæmia of secondary type, great increase in the number of lymphocytes in the blood, and aggregations of similar cells in the internal organs intermediate forms are met with in which, during life at least, considerable difficulty may arise in determining to which category they belong. For whilst on the one hand a relative increase of the lymphocytes is usual in pernicious anæmia, on the other certain cases of leukæmia, to which the term "aleukæmic" has been applied, present no excess of leucocytes in the blood. Further, in certain of the acute forms of lymphatic leukæmia no enlargement of lymphatic glands occurs (suggesting that such enlargement when present is secondary rather than primary) and not only normoblasts but also megaloblasts may be present in the blood stream. Again, symptoms of leukæmia and of pernicious anæmia may be combined in the same patient and it is for such cases that Leube has suggested the term leukanæmia. Most authorities agree that all the phenomena, including the blood picture, of pernicious anæmia may be consecutive to ankylostomiasis, atrophy or carcinoma of the stomach, bothriocephalus latus, &c., and perhaps the most reasonable way of looking at those cases of leukæmia which present symptoms of pernicious anæmia is to regard the latter as secondary to the leukæmic just as it may be to the other conditions mentioned.

In the following case, though undoubtedly one of leukæmia, it is *significant* that the anæmia was extreme, that both normoblasts and megaloblasts were present in the blood, that the total number of leucocytes was not increased (though this is perhaps discounted by the fact that there was not only a relative but also an *actual* increase of non-granular cells), and that free iron was present in the liver.

The patient, aged 20 years, single, was admitted into the *Royal United Hospital*, Bath, under the care of Dr. G. A. Bannatyne, on March 16th, 1907, complaining of pains in the limbs, especially in the neighbourhood of the joints. The pain was first felt in September, 1906, in the back and legs. In October he consulted a medical man and after taking two bottles of medicine the pains became less severe. A few weeks later they returned and persisted until his admission to hospital. In December he had a severe attack of nose bleeding. About the beginning of January, 1907, he noticed, for the first time, some lumps in his neck near the jaw. Three weeks before admission he had another but less severe bleeding from the nose. His skin had been harsh and scaly as long as he could remember, but no history of a like condition of skin in any other member of the family could be obtained. There was nothing in his personal or family history suggestive of syphilis and he presented none of the stigmata of that affection. On admission he was profoundly anæmic, his face being of a dirty yellowish hue. The skin over the upper part of the forehead and over both parotid regions was very scaly. The scalp was dry and scurfy, the hair being lank and lustreless; there was a little very fine hair on the upper lip and chin. There was slight eversion of the lower eyelids. The trunk, especially the abdomen, was covered with thick, horny, epidermal plaques, of a dirty greenish-yellow or brown colour. The skin was very hard and thickened and felt rough and harsh, like that in which prompt medical aid might save life, are comparatively rare in practice, and when they occur are often the consequences of previous neglect on the part of the patient or his friends. Hundreds of people, especially among the poor or among the lower middle classes, will neglect even serious illness until they suddenly become frightened, and then they run for the nearest medical man, with little regard either to their means of paying for his services or to the truthfulness of the assertions by which they induce him to dislocate the natural order of his work. Many such people are not intentionally dishonest, they are only ignorant and panic-stricken; and the profession itself is not free from blame in relation to the attitude which they assume. Some of the letter-writers to whom we have referred attribute the facility with which medical men give credit to untrustworthy persons to the amount of competition for practice which generally exists; but we think this view of the case is at least greatly exaggerated, even if it be not altogether mistaken. The truth is, we believe, that medical men, like other skilled persons, take genuine pleasure in the exercise of their skill, and in the consciousness of the relief brought by their presence to frightened sick persons and to their friends. Their first impulse is to pursue their calling, and the consideration of how or when or by whom they are to be paid is usually little more than an afterthought.

Such a state of feeling as this, while it explains alike the ordinary routine of medical conduct and the testimony borne by a large number of correspondents to the usually unstinted benevolence of the profession—testimony which the daily life of almost every practitioner would confirm—is manifestly much exposed to exploitation by the dishonest and the designing. The profession would, we think, be well advised in the adoption of any well-considered principles by which its members would be protected, while, at the same time, its brilliant record of public usefulness would be preserved and handed down. Much might be done in many localities by judicious coöperation among practitioners, and by associated resistance to the endeavours of clubs, or societies, or public authorities, or even individuals, to create and to trade upon professional rivalries or jealousies. Much might be done in the direction of educating public opinion and of producing a conviction that if it be right that medical assistance, without reference to payment, should be forthcoming in every real or fancied emergency, the duty of so providing should not be confined to the medical profession but should be shared with them by the rest of the community. This is already done to some small extent in the cases of parochial medical relief and in those in which medical aid is summoned by the police, and the principle would admit of easy extension to all real emergencies. If it be the duty of the members of the medical profession to stand prepared, as public servants, to deal with unforeseen conditions in which their skill is needed, it is equally the duty of the public to see that such service does not go unrewarded by reason of the poverty or the dishonesty of the person to whom the unforeseen occurs. In ordinary cases of illness there does not appear to be any equivalent obligation, and the profession may reasonably be expected to protect themselves to a greater extent than, we fear, they are accustomed to do at present. It is perhaps less troublesome to attend the call of a shifty or dishonest patient than it would be to refuse, but there are many circumstances in which a practitioner would be fully justified in thinking of the general interests of his profession as well as of his own, and in which a demand for cash payments as a condition of attendance would serve as a wholesome lesson, the effects of which would not be limited to the house in which it was administered. *The facility* with which some medical men give credit is in many cases a direct inducement to dishonesty.

Annotations.

"Ne quid nimis."

POOR-LAW GUARDIANS AND THE MIDWIVES ACT.

WE have referred previously to a serious difficulty arising out of the working of the Midwives Act to which a medical man called in by a midwife to a case of difficult labour is liable, namely, the difficulty of obtaining an adequate—or indeed any—fee for his work, and we have noted the action of several boards of guardians which have taken upon themselves the responsibility of meeting legitimate medical charges in a more or less liberal spirit. In March last the London and Counties Medical Protection Society circularised the 648 boards of guardians in England and Wales, stating the views of the society on the matter as expressed in a report of its Midwives Committee and asking the various boards to express their opinion, bearing in mind the provisions of Section 2 of the Poor-law Amendment Act, 1848, which are applicable to the payment of medical practitioners called in by midwives, and which run—

> It shall be lawful for [illegible] if they think proper, to pay for any medica[illegible] be rendered to any poor person on the [illegible] bodily casualty, or sudden illness, although no order shall have been given for the same by them or any of their officers or by the overseers.

Up to July 30th the society had received replies from 152 boards of guardians, and we have been enabled to read 140 of these. An analysis shows that 56 were to the effect that no action was to be taken in the matter or that its consideration was deferred; of these replies a few were from unions in which there are no midwives practising, and some others contained a direct refusal from boards to accept any responsibility of providing medical assistance for midwives altogether Eight boards consider that their own district medical officers can give the requisite attendance, and most of them have arranged to pay these officers the same fees as they already receive when they attend confinement cases under a midwifery order from a relieving officer. A good many others are willing to pay a medical man called in by a midwife, provided that the services of the district medical officer are not available and that the case is one of genuine poverty. Others express their willingness to pay a fee with only the latter stipulation and these two classes together comprise 60 replies. 16 boards are prepared to treat each case as it arises on its own merits. Of the 60 that are willing to pay, 7 accept the Local Government Board scale of £1 or £2, according to circumstances, and the fees promised by the others range from a maximum £2 for operation cases, or for those requiring the attendance of a second medical man, to the impossible minimum sum of 5*s*. From a half to one guinea, according to the difficulty of the case, is a very usual scale. In some cases *the higher fee* is fixed to include subsequent attendance by the medical

Mr. A. R. Beaumont, the house physician, for the notes which he took; Mr. R. E. Moorhead for kindly supplying me with details of the family history; and Mr. W. G. Mumford for most valuable assistance at the post-mortem examination.

Bath.

A CASE OF SEVERE VERTIGO AND TINNITUS; DESTRUCTION OF THE LABYRINTH; CURE.

BY MACLEOD YEARSLEY, F.R.C.S. ENG.,
SENIOR SURGEON TO THE ROYAL EAR HOSPITAL; MEDICAL INSPECTOR OF DEAF SCHOOLS, LONDON COUNTY COUNCIL (EDUCATION), ETC.

THE following case is, I believe, the ninth operation of its kind for the relief of distressing vertigo or tinnitus, or both, excluding those in which successful or unsuccessful attempts have been made to divide the auditory nerve.

The patient, a clergyman, aged 47 years, consulted me on Oct. 15th, 1907. His history was as follows. As an infant he had suffered from otorrhœa on both sides but his ears had been entirely free from discharge for over 18 years. He had always been a little deaf and for nearly 12 months he had not been able to hear his own voice. Previously to that he had been able to hear with an ear-trumpet. Deafness had been complete for seven weeks. 12 years ago he had two attacks of vertigo, the first occurring whilst he was conducting service. His health was much impaired at that time from overwork. He took a sea-voyage and was better for four years. His health again broke down and his deafness became worse, but he did not then suffer from vertigo. For the past three years he had suffered from continuous tinnitus of a roaring, machinery-like character, with attacks of vertigo about every six weeks. From May, 1907, the vertigo had become more frequent and more severe. It had been much worse during the six weeks before consultation, whilst the tinnitus was becoming "unbearable." At different times he had consulted five well-known aural surgeons and had taken a variety of drugs, including asafœtida, strychnine, bromides (until a bromide rash appeared), &c. As family history it was stated that both his grandfathers were deaf, his mother was slightly deaf, and his father suffered from vertigo at the age of 30 years.

Present condition.—The patient was a stout man, below middle height, plethoric, and suffered a good deal from constipation. He had two severe attacks of vertigo whilst in the consulting-room, in which the head was turned strongly to the left, the body was thrown back, and the eyes were closed, the eyeballs being directed to the left. There was no loss of consciousness. He stated that the attacks were specially induced by looking up or turning the head suddenly to either side, that he felt as if he would fall to the left, and that there was apparent movement of objects towards the right. He also volunteered that the tinnitus was much worse before an attack of vertigo. Both tympanic membranes were much thickened and indrawn; the left showed some loss of mobility to the Siegle pneumatic speculum. There was considerable chronic hypertrophic pharyngitis, with some hypertrophy of the tonsils. The nasal septum was deflected to the right. The only signs of any hearing power that could be elicited by careful functional testing were that with the right ear he could count the strokes of the bell at ten feet and could detect the sound of the Edelmann-Galton whistle between 4000 and 5000 vibrations. The urine was acid, of specific gravity 1015, and contained no albumin or sugar. Dilute hydrobromic acid, half a drachm, with sulphate of quinine, one grain, three times a day, was ordered, together with one grain of calomel every night.

On Oct. 29th there had been no attacks of vertigo for over a week. The week before there were six attacks, two of great severity. The patient complained of occasional "swimming *in the head*" *and much* "buzzing" in the morning, with a sense of intense weakness. There was no hearing.

Having been granted six months' leave from all duty the patient stayed until Christmas at Brighton where he had only one slight attack on Nov. 23rd, although there had been a slight dizziness from time to time. I saw him again on Dec. 31st, when he stated that his tinnitus had been constant in the left ear for the past week, that he had had a slight attack of vertigo on Dec. 26th, three similar attacks on the 28th, and four on the 30th. He had been sleeping badly for several nights and his tinnitus had been very severe until the morning of the 31st, when he had a bad fit of vertigo in which he was "convulsed," after which the noises ceased. He returned home, but not to work, and was ordered 4 minims of liquor strychninæ with 1 drachm of dilute hydrobromic acid three times a day, and 2 grains of cascara every night.

Owing to the constipation from which he suffered the patient came to London on Jan. 6th and underwent a fortnight's abdominal massage which greatly improved the condition of his digestive organs. He also learned lip-reading, in which he speedily became very proficient. He remained in London until Feb. 26th, during which time he *had slight giddiness daily and severe attacks of vertigo* on two occasions. He returned to his vicarage on Feb. 26th and from that time his tinnitus and vertigo became steadily worse. On March 4th he had four severe attacks of vertigo. On March 14th a tape seton was inserted after the method of Wilson Parry,[1] but this treatment did not appear to have any effect upon his tinnitus or vertigo. The former became "unbearable," and he had between 40 and 50 attacks of the latter of varying severity between March 4th and April 30th.

As the patient was becoming very disheartened the question of operation with a view to destroying the left labyrinth was discussed. Recourse to such a measure had been suggested but I purposely delayed urging it until other methods had been tried. On May 19th he was seen in consultation by my colleague, Mr. R. Lake. On that occasion it was found that the use of the Siegle speculum on the left side caused vertigo and that movement to the left on a turn-table at once elicited vertigo which was accompanied by very slight left lateral nystagmus. With the heels together and the eyes closed he swayed to the left. The results of functional tests were as follows: Bone conduction to all forks on both sides was *nil*. By air conduction there was perception only to C^2 (512), C^3 (1024), and C^4 (2048). With the continuous tone whistle he heard from a^2 to a^3 but missed c_4 sharp. He was quite unable to hear the voice. As Mr. Lake agreed with me as to the advisability of operation the patient was admitted to the Royal Ear Hospital on May 27th. The next morning he had a very severe fit of vertigo at 11 A.M. whilst he was being prepared. This was so far the last attack he has experienced.
